

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## The Cycas.

Under their popular name some of the commoner species of this genus are undoubtedly familiar to all our readers. Popular names are usually most untrustworthy and misleading in their nature, and the name of "Sago Palm" is not in any way an exception to the rule, for the plants so-called are neither Palms, nor do they furnish any of the sago of commerce; it is, however, true that the trunks of both *C. circin-*

naked ovules. The accompanying illustration shows such a plant. The photograph from which the picture is reproduced was sent to us by Prof. Atkinson, of Cornell, and concerning the plant itself Mr. R. Shore, who has charge of the botanical collection there, writes:

"A plant of *Cycas revoluta* has been under my care for the past fourteen years in the botanical conservatories of Cornell University. I do not know its exact age, but it was a

FIG. 1.—CYCAS REVOLUTA IN FLOWER, AT CORNELL UNIVERSITY.

alis and *C. revoluta* abound in starch, which in the countries to which they are respectively native is prepared into a food which is used somewhat as we employ sago.

Though many a collection of plants includes a *Cycas* still it cannot be said to be a common event for it to flower. The pollen bearing flowers grow in cones, and the female flowers, which are produced on a different plant, are formed into a crown of leaves surmounting the stem, a tuft of short woolly growths with indentures along each side where are borne the

small plant in a 10-inch pot when received from Professor Albert N. Prentiss, who had grown it in his laboratory for two years. It has made a rapid growth during the past fourteen years, and now has a spread of about 9 feet, each leaf measuring about 4 feet and 2 inches. There are 136 leaves on the plant. It has flowered three times; this year (the third time) setting new leaves before flowering, while formerly no new leaves were formed the year in which it flowered. The photograph was taken in July last."

## Destructive Insects and Methods for Controlling Them.—I.

BY PROF. W. G. JOHNSON.

In this series of articles it is not only our purpose to treat the more common injurious pests of the fruit garden, lawn, greenhouse and nursery; but we hope to introduce from time to time an article devoted exclusively to answering queries from the readers of this journal. We will also endeavor to keep our patrons posted about the current literature, and whenever occasion demands we will present a paper on any special topic of general interest. So far as possible, we will eliminate all scientific terms and technicalities, and present our articles in a popular style, using illustrations whenever it is practicable.

### Pests Considered.

During the year we will consider the following destructive insects: (1) In the fruit garden—the codlin moth, plum curculio, peach tree borer, apple tree borers and San Jose scale; (2) in the greenhouse, a general article on scale insects, mealy bug, plant lice, white ants and the so-called red spider; (3) in the lawn—leaf-hoppers, cut-worms and white grubs; (4) in the nursery—woolly apple louse, apple-leaf skeletonizer, leaf-roller and crumpler, leaf-hopper, slug and the pear-leaf mite.

### Number of Species.

By way of introduction to this series of articles, some figures as to the total number of species of insects in the world will not be uninteresting. Indeed, very few people have any idea of the actual number existing. From lists of described species, and the estimates of specialists, the late Dr. C. V. Riley estimated that 30,000 species have already been described from North America, while the number described, or to be described, from Central America, foots up just about the same.

Linnaeus knew nearly 3000 species, of which more than 2000 were European, and over 800 foreign. In 1853 Dr. John Day placed the number at 250,000. Thirty years later Dr. Sharp's estimate was between 500,000 and 1,000,000. Sharp and Walsingham placed the number at 2,000,000 in 1889. Dr. Riley was of the opinion that these latter figures were very modest. It must be taken into consideration that the insects of the more temperate portions of the globe have been best worked up, but in the more tropical portions they have received little attention, and vast numbers remain to be characterized and named. There are many portions of the world where no entomological explorations have been made, and even in the best worked regions by far the larger part of our very minute insects remains absolutely undescribed in our collections, and have been very partially collected. There are now described annually nearly 7000 species.

After taking the above facts into consideration, Dr. Riley was of the opinion that not one-fifth of the species extant have been characterized or enumerated. In this view of the case the species in our collections do not represent more than one-fifth of the whole, and to say there are 10,000,000 species of insects in the world would be, in Riley's judgment, a moderate estimate.

Peninsula Horticultural Society will meet at Melford, Del., on January 6.

## Money Methods in the Market Garden.—III.

### Vegetables in the Old Strawberry Bed.—Rotation of Garden Crops, Etc.

In a former article I described my plan of raising cauliflower and cabbage in the new bed of strawberries, while growing plants set in the spring. I will now give in detail my plan of growing vegetables in the strawberry bed the following year.

All the strawberries that are marketable are picked the first week in July; and if the bed is to be picked from another year, the use of the land must be lost for three or four months. All this time the bed must be weeded, yielding no returns for the work the same year. I do not wish to hoe and weed a strawberry bed all fall without getting something for my work, so I am trying the plan of growing late vegetables between the rows of strawberries after the fruit has been picked. If I decide to run the bed two years, immediately after the berries are picked I mow the plants as close to the ground as possible, but before doing so, if the ground is wet, I pull all the large weeds. It is better to burn the bed over after mowing it, if it be dry enough. Sometimes it is necessary to cover the bed with straw or other litter, so that the work of burning over may be done thoroughly. With a light plow, I turn two narrow furrows together between the strawberry rows, leaving them from 12 to 16 inches wide; then I level down and pulverize the furrows with a cultivator. Before running the cultivator over the ground the last time, I cover the strip well with rotted stable manure, if obtainable; if not, I scatter some good commercial fertilizer upon it.

In order to get a good growth of late vegetables when planted at this time of year, the soil must be well supplied with available plant food. What to plant in these rows will depend on the market or the use that can be made of the land. If there is a demand for them, set Early Winningstadt cabbages up to July 20; later than this date, plant rutabaga, turnips, kale, spinach, or whatever vegetable is the most profitable and adapted to late planting. If you have live-stock to feed, cabbages and turnips will repay you for your work; and these vegetables usually also bring a good price if kept until spring.

The narrow rows of strawberry plants can be easily weeded at the same time as the vegetable plants are being cultivated. My strawberry bed is made very rich by the manure which is applied before the plants are set, and afterward in mulching them. The rich soil starts a good growth of new strawberry runners, which will set in the space next to the vegetable plants that have been kept clean by frequent hoeings. The outside leaves may be removed from the cabbages to make more room for the strawberries. In the rich soil all the plants will grow very rapidly.

After the bed has been picked the succeeding year I plow it, and set it to winter celery. I can usually get the transplanting all done by the middle of July. I have water pipes laid over the field, and take the water from them with a hose, so if the ground is dry at this time of year the transplanting is not delayed for want of water. The winter varieties of celery are set in rows about one foot apart, and irrigated when there is not sufficient rain to keep the ground wet. The strawberry bed on which the celery

is planted has received three heavy dressings of stable manure, one before setting the strawberries, and one for a mulch each winter afterwards. In this rich soil with irrigation I get a good growth of celery.

Celery when planted so close cannot be handled—i. e., the stocks cannot be made to grow upright by hoeing earth around the plants. To a certain extent I have practiced the method of winding the plants with twine. It is much cheaper than the old way of handling, but it takes considerable time to do the work. The twine is not tied or cut, but simply wound once or twice around the plant, and then carried to the next one, and so on. The celery has usually finished growing by the last of October, and then I begin to blanch it for the holiday trade. I have a plan for blanching the part of it that can be sold before January, which, I think, is going to work well, and by which I can use the boards that were employed in blanching the early celery. Between two rows I drive a row of stakes about 2 feet high; against these I place some boards; then I dig up enough celery and set it against the boards to make a row of plants about 1 foot wide, then another board is set up, and more celery dug for another row. The process is continued until 15 or 20 rows of celery are taken up on both sides of the first row of boards. The plants are taken up with a spading fork, and have some soil attached to the roots; and a little more soil is shod over and pressed around them when the plants are put in. In this way the celery is stored on the surface of the ground in much the same way as it is stored in cellars. Celery may be stored in this way very rapidly, as no trenches have to be dug, and no carting to the cellar done. No earth is put around the celery to soil it, and it needs no washing. Celery stored in this way usually requires no covering until after Thanksgiving. Some boards or hotbed sash may be laid over the top if the crop be in danger of freezing; and if not all sold before winter a covering of straw is furnished.

There is usually enough moisture in the ground at this time of year to start a new growth of roots on the plants, and the celery soon blanches in the darkened spaces between the boards. The leaves should be exposed as long as the weather will permit, to keep them green.

The celery is very easily taken out and prepared for market; all that has to be done is to take down the boards, trim and bunch it.

When it is desired to keep the celery longer than Christmas, I would advise storing it in trenches. The trenches should not be more than 18 inches wide, and the earth should be drawn around the celery as high as the tops, leaving them exposed as long as the weather will permit. Before the ground freezes, and when there is a little frost in it, lay a board over the trench and cover it about one foot deep with earth or manure. The little frost that is in the celery will preserve it, so that it will keep until spring, when the best prices may be obtained.

My plan is to set one quarter of my truck farm to strawberries every year, and grow cauliflowers and cabbages between the rows the first year. The next year, after picking the berries, I grow a crop of late vegetables between the rows, as above described; then the following year, after the second crop of strawberries has been picked, I plow the bed and grow a crop of late celery the same year; the next year I grow a crop of early celery on the same land, according to the method given in my first article on the "new celery culture,"

and the subsequent year I reset the land again to strawberries, and continue the rotation as before. This plan gives me six crops in four years—two of strawberries, two of celery, one of cauliflowers, and one of cabbages, or other late vegetables.

The income from an acre with this rotation should be in four years as follows: Two crops of celery, \$4000; two crops of strawberries, \$1000; one crop of cauliflowers, \$1000; one crop of cabbages, \$500; total, \$6500, or an average of about \$1600 per year, making the income from four acres \$6500 per year. From this amount must be deducted the cost of fertilizers, labor, horse-keeping, seeds and tools, and other incidental expenses, which will probably take one-third of the amount named. These results can be obtained only by using large quantities of fertilizers and water for irrigation, by having a good market for the produce, and most important of all, by skill in gardening operations.

### A Garden and Fruit House.

A small house near the garden will be found of decided advantage, for in it can be placed all the tools needed in the garden, the seeds and fertilizers, and here can be stored for a longer or shorter time the crops as they are gathered in the fall. Here, too, can be done the dirty work of preparing each day in summer the corn and vegetables for the kitchen, where such work makes an inconvenient litter. Most farmers and gardeners, however, might think that, although convenient, such a house could hardly be afforded, but a different aspect is given the matter when one reflects that such a garden house may be made a fruit house as well, where the produce of the orchard can be gathered, barreled and stored away, for such a house may have a cellar to which frost will not gain access. The accompanying illustration suggests the form and construction of such a house, where common field stones

fully as cheap to build up to the roof with the stone as to use framing, boarding, shingling, and the usual finish. Besides, such walls give a very picturesque building, especially when surrounded by shrubbery, and adjacent to a garden or orchard. The rounded field stones

FIG. 2.—MAKING CELLARS FROST PROOF.

give the best effect, and these can be laid rapidly, as none of them need be split or cut in any way. The cellar of such a building should be well drained and have double windows, with a chance to ventilate when desirable.

WEBB DONNELL.

FIG. 3.—ORNAMENTAL GARDEN AND FRUIT HOUSE.

are abundant—and the localities are exceptional where field stones are not common. Where one puts in a cellar wall of rough stones it will be found fully as cheap to carry the wall right up to the roof with the same kind of stones, using a mixture of cement, lime, and sand for mortar, the cement being somewhat in excess of the lime.

I have recently been having quite an extended amount of rubble stone wall erected, and I found it would be

**Illinois Fruit-growers.**—The fruit-growers of this section have been making arrangements with E. G. Mendenhall, of Kimmund, General Manager in Illinois, for the American Fruit Growers' Union, to establish local branches of that organization. It is probable that the fruit-growers of Southern Illinois will also ask Governor-elect Tanner to appoint a well-known and reliable horticulturist to the Board of Railroad and Warehouse Commissioners.

### Making Fruit Cellars Frost-proof.

Many old cellars are not so proof against frost as to make the storing of fruit in them an entirely safe matter. A low temperature is certainly needed to keep fruit in the best condition, but the possibility of the mercury falling below the safety point during a cold snap is a factor to be guarded against. A cellar can be made frost-proof by laying a single wall of brick inside the underpinning, leaving an air space between the bricks and the outer wall, but this is somewhat expensive. An easier and cheaper way is to put up some short studs just inside the underpinning, and to nail upon these thin matched boards, down to a point a little below the ground on the outside of the cellar wall, leaving an air space as shown in the illustration. Fruit will then be out of danger from low temperature outside. W. D.

### The Fruit Garden.

**Apples.**—In favorable weather attend to the pruning, or rather thinning, of branches of the young trees. There will not be much to do if the foundation was started right, but few men are satisfied with three to five slim shoots as the base of the future spacioustree. When you see a vigorous, shapely tree carrying a crop of good marketable fruit, get under it, and study the layout of the main branches and carry it in your mind as you commence to form your tree; in fact, a tree two or three years after planting, should appear thin rather than symmetrical.

**Root Pruning.**—If trees planted six or eight years are making long, sappy shoots and showing very few flowers and less fruit, don't cut back the wood, but as soon as the frost is out of the ground, cut a narrow trench around the tree, about 2 feet inside the circumference of the branches, cutting off all roots and smoothing with a knife the ends of the large ones. On the younger trees encourage the main branches to extend; the nearer they come to the horizontal line the better. Do not shorten them in, for on the tips of them first samples are often obtained, and they make fine weights to keep the leaders down.

**Pears.**—The catalogues will begin to arrive soon, and doubtless many fruit growers will have a desire to try a few varieties other than they have. To-day, the number of varieties catalogued is confusing to the average man, and too often misleading. I think the best way is to keep track for one season of how the supply of pears holds out, noting the time when the fruit was gathered, when ready for the table, and when past its best. If the season can be covered without a break, and it is desired to improve on flavor it is advisable to seek intercourse with other growers, because fruits, especially pears, vary much in flavor even in adjacent localities. Again, more often the fault is with the picker than with the soil. All has not yet been learned of the proper time to pick different varieties of pears to get the flavor they should have when sent to the table.

**Spraying apparatus** should be in working trim, and insecticides and fungicides at hand ready for application when the few mild days in January come.

**Kelffer Pear.**—I would advise getting this, if not already being grown, to try it. Some people appreciate the peculiar quince-like flavor. To get it right, thin the fruit; let it hang on the tree until near freezing weather; pick and store in fruit-room, and towards the end of November bring a supply sufficient for a few days into a temperature of 60°, keep the fruits dark, when they will be fit to use in two or three days. The tree itself is worth growing for ornament, as the foliage is large and glossy, and, moreover, turns to a fine color in autumn.

J. HOLLOWAY.

## Horticulture in Canada.

The meeting of the Horticulturists' Lazy Club, Cornell University, held on Monday evening, December 14, was devoted to the above subject. It was presented by Mr. P. B. Kennedy, a graduate of the Ontario Agricultural College, which, the speaker said, is the only institution in Canada where instruction in agriculture is given.

The subject was represented mainly in connection with the Government experiment farms, but in opening his discussion, Mr. Kennedy made reference to some of his experiences at the above-named college. Up to the time of his graduation in '94, horticulture at this college was in a very crude state. The professor of horticulture was also professor of geology, all the departments of botany were under his charge, besides several other duties of a more or less varied nature. The instruction in horticulture consisted mainly in going about the grounds and learning the names of a few shrubs.

Now, however, this condition of things is greatly changed. A professor of horticulture devotes his entire time to this line of work, and a good course of instruction is given, and experimental work carried on.

Referring to the experimental farms, the speaker said there were five of these. About 3000 acres of land are controlled by the experimenters.

The main farm, of which the others are branches or sub-stations, is situated at Ottawa, and the branches are located, one at Nappan, N. S.; one at Indian Head, N. W. Territory; a third at Brandon, Manitoba, and the fourth at Agassiz, B. C., near Vancouver.

At the main farm in Ottawa the climate is severe, and many fruits have to be discarded on this account. Many of the Russian sorts have been found to thrive here, and the native plums are being improved. In 1887 there were 881 varieties of fruits under experiment, while at the present time there are 1392 sorts.

About 65 acres are devoted to ornamental trees and shrubs, special attention being given to plants for hedges. The interest in floriculture is not large.

The branch farm in Nova Scotia, being situated in the Annapolis Valley, is in one of the most favorable locations for fruit growing. The farm is well sheltered and the soil congenial. Fruits of the best flavor and lightest color are here grown.

The Gravenstein, Baldwin, and Nonpareil are popular apples. The apple scab causes but very little damage. Pears, plums, and cherries are also grown.

There are now under cultivation at this farm about 200 varieties of large fruits and 75 of small.

The branch at Mandon, Manitoba, is in the wheat country. The climate is so severe that but little success has attended the efforts in the direction of fruit growing. A few of the Russian and Siberian sorts have proven hardy, and the native wild plums are of some value. Currants and gooseberries are grown with good success. A few, perhaps a hundred, ornamental trees have proven hardy.

The climate and conditions at Indian Head are not materially different from those in Manitoba.

At Agassiz the climate is very similar to that of England, and nearly all fruits can be grown more or less successfully. Plums bear immensely, and mulberries, filberts, chestnuts and others thrive here. A very large number of varieties is grown at this branch for experimental purposes.

In some parts of Canada, particularly about Lake Erie, grapes and peaches are successfully cultivated.

During the course of his remarks the speaker made reference to the way in which

England advertises her colonies, and in this connection spoke of the Imperial Institute situated near the Natural History Branch of the British Museum in London. In this building there are rooms representing each colony in which are stored samples of the agricultural products—grain, jars of fruit, bearing the grower's name, furs, etc. Each colony is also represented by an officer whose duty it is to give information concerning the colony which he represents.

Cornell University. H. P. GOULD.

## Roses and Carnations.

An evening session of the recent Michigan State Horticultural Society's meeting was devoted to these flowers. Henry Smith, a large and successful florist of Grand Rapids, read a paper on "Rose Culture, Outside and Under Glass." Mention was made of the references to Rose culture in early history, both sacred and profane, and to the large number of species from which our cultivated varieties of to-day have come, most of them being natives of China, India, and Persia.

On account of their hardiness many of the varieties of the Cabbage Rose are well adapted to outdoor culture, but with proper care the varieties of the hybrid perpetual class gives the best results. Among the best varieties of this class are Coquette des Alpes, Paul Neyron, Ulrich Brunner, General Jacqueminot, and Mrs. John Laing. The Tea Roses also do well if given proper protection during the winter, but in most cases the Hybrid Teas will be preferable. The Climbing and Moss Roses are also well adapted for growing out of doors. Among the best sorts of the latter class are the Baltimore Belle, Queen of the Prairies, and Crimson Rambler. As bedding Roses the Hermosa and Clothilde Souper also are quite desirable.

For growing in greenhouses the Teas and Hybrid Teas are most used. Among the best sorts are Perle des Jardins, Bride, Kaiserin Augusta Victoria, Bridesmaid, Caroline Testout, Meteor, and American Beauty. Cuttings should be struck in January, potted as soon as rooted, and kept continuously growing, by an occasional re-potting, until ready for planting out, which should be done during May and June. Roses need rich soil of manure and rotten sods with considerable clay, and plenty of water, but care should be taken not to give an excess. An even temperature should be maintained, but for the different varieties this will vary from 58° to 65° at night.

"The Carnation" was the subject of the paper of N. B. Stover, of Grand Rapids. On account of the great improvements that have been made in this flower during the past few years, the attention of the public has been directed to it until it is exceeded by the Rose alone in the number of the flowers grown, and it is probable that the height of perfection has not yet been reached. In Grand Rapids alone one hundred thousand plants are grown each year.

The Carnation does best in a comparatively low temperature, but requires an abundance of air and light. The cuttings are made at any time from December to February, and are rooted in a cutting bed containing 4 inches of sand. When the roots have formed they are planted in shallow flats, 3 inches apart each way. When spring opens they are planted in the open ground at about 20 by 12 inches, and are given thorough cultivation.

When flower stems start they are pinched back until the first of August. During this month they should be transplanted to the houses where they are to flower. Opinions vary as to the best method of taking them up, whether to keep on all the soil possible

or shake it off, but probably when grown upon sandy loam soil, in which they do best, it will be preferable to shake off the soil. Press the soil firmly about the roots, water thoroughly, and shade in some way for three or four days, during which time the plants should be syringed four or five times daily, taking care not to saturate the soil. The plants will be benefited by the application of weak liquid manure about December 1, and this should be repeated every two weeks, gradually increasing its strength. The Carnation rust is the worst disease to which the plants are subject, and it is much to be dreaded. The best remedy is Fowler's solution of arsenic, at the rate of 1 ounce to 8 gallons of water. The solution can be purchased at a drug store or can be made by heating together 616 grains of arsenious acid (white arsenic), 1232 grains of bi-carbonate of potash and 4 ounces of water. This should be diluted before using (1 ounce to 8 gallons of water) and sprayed over the plants at the first appearance of the rust, carefully covering the under as well as the upper side of the leaves.

Soon after they are planted some kind of a support should be provided. The kind preferred by Grand Rapids florists is known as the Creelman support, having been invented by a florist of that name, living in Grand Rapids. It consists of a wooden stake about 1/2 an inch square and 2 feet long, to which a spiral coil of galvanized wire 5 inches in diameter is fastened. The cost is about one-fourth cent each, aside from the labor.

Of the varieties grown by florists, Day-break easily stands at the head, and too much cannot be said in its favor. The flowers are of a delicate shade of pink, and readily sell for more than any other variety. Wm. Scott, in color rose pink, is also a popular variety. Silver Spray is the most profitable white, although Ivory, a new variety, is very promising. Of the red sorts, Portia, Pres. Garfield, and Emily Pierson are most grown. Murillo, a seedling grown by Hopp & Lempke, of Grand Rapids, is regarded by all who have seen it as the coming red variety. It will probably be disseminated in 1897. The plant is a good grower and free bloomer, and the flowers are large, full, and of a rich deep red, with a large stout stem, good calyx and deeply frimbriated petals. Goldfinch and Mayor Pingree are the best yellow sorts.

**Manhattan (Kan.) Horticultural Society** met December 17, at the horticultural hall of the State Agricultural College. The weather being bad there were not as many present as usual. The officers now serving were re-elected for the coming year. One good paper was read, "My Experience in Fruit Growing," by C. W. Kimball.

**Makanda, Ill.**—The members of the Fruit Growers' and Shippers' Association held their annual election last Friday. The following officers were elected: T. S. Welstead, president; Ben. L. Wiley, secretary; President Modglin, H. E. Ferrill, and John Crawshaw, directors, to serve three years. The Association joined the National Fruit Growers' Union.

**Blackberries per Acre.**—Sixty to one hundred bushels of blackberries per acre is a fair yield, but double that amount can be grown on loose rich loam, with a clayey subsoil, provided extra care be given.

**Selection of Clons.**—I am very careful in selecting clons to cut them from the tops of trees which are healthy and vigorous. I should prefer to not take a clon from a tree which has the least decayed spot in it.

## Why Neglect the Solanums as Pot Plants?

In asking the above question I do so under the impression that at least one old time favorite of the genus is not now receiving the attention from our lovers of pot plants that it deserves. I refer to the Star Capsicum, or the Jerusalem cherry, which, if they are not one and the same thing, certainly are much alike. The botanists, I believe, observe a difference, calling the first one *Solanum capsicastrum*, the other *Solanum pseudo capsicum*. The growth of the latter appears to be stronger and somewhat coarser than the other, otherwise they are quite identical. In any event, here are plants of the easiest culture, suited to the greenhouse or the window, and which are covered with much bright scarlet fruit, the size of hazel nuts, during a long period of winter, beginning in the fall. They never look better than at the holiday season just when there is a remarkable dearth of bloom, unless one pays stiff prices for cut flowers at the florists.

I have no doubt that one thing which has tended to bring the Solanum here referred to into disfavor with many, has been the ill-shaped specimens thereof that have too often been paraded in the greenhouses and markets. Because this is one of the easiest of all plants to grow after some fashion, is no reason why it is not worth while to give it the best of attention, with a view to growing it in the best possible fashion.

rooted in March. To get a suitable supply the stock plants should be hastened in fruiting by giving them a warm, sunny place in the greenhouse and withholding water somewhat. Soon after New Years cut them back and increase the watering, giving them a moderately warm place, and soon there will be plenty of slips. From the cutting bed put into thumb pots, and from there make but a single shift, and that into three-inch pots, for a year. During the summer plunge into frames, and give next to starvation treatment. They possess strong vitality, and by treatment that would hurt many kinds these will be gaining a foundation that will tell well on after beauty. This is somewhat on the principle of retarding Ten-week Stocks for the finest bloom. During the following winter keep the plants in the coolest house, anywhere not actually penetrated by frost.

In March or April of the second year, head back the plants, shake out some of the ball of earth and repot into fours, using now some rich, loamy soil. With the coming of warm weather, plunge the pots in frames, give a last heading-back of the young growth, and the final shift into six or seven-inch pots in July. Keep the plants uncrowded, water them freely, remove to glass before frost, and by December you will have as fine a stock of dwarf, round-headed and free-fruited cherry bushes as you can wish to see. Side of such cutting-raised two-year-old Solanums the common run of plants raised from seed looks quite weed-like, and impresses customers accordingly.

such I hardly know of a prettier climbing plant than the Jasmine like Solanum of our greenhouses. It is of the easiest culture, and has many handsome bluish white flowers in axillary clusters, almost continually. The leaves are deep green and pointed. A few other tender species possess some value in the large and showy leaves, possessed for what is known as an "tropical effect." ELIAS A. LONG.

[In a few sentences which we have not considered it necessary to publish, our correspondent refers to the popularity of Solanum capsicastrum in the London market, and commends that as a hint to florists generally in this country. We are fully aware of the popularity of the plants as grown for Covent Garden, and we have seen both bought and sold thousands in that mart at the average rate of nine shillings per dozen (sometimes a little more, sometimes less). Our florists hardly came to work upon such small margins of profit as that means; then again, if New York City be any guide to the state of the public pulse, the plants are in no way popular. Attempts are made each year to push them, and each season the same dismal failure results. Not that the plants are not well grown, for if possible they were better grown than those offered in London. This past fall hundreds of well berried plants have been sold at wholesale at such wretched prices as \$5, \$8, and \$11 per 100. One great drawback in this country to the plant's popularity is its susceptibility to suffer from dry heat; in the average American home, heated as it is by steam or from a furnace, the plants quickly dry out, and thus drop their leaves, and soon their berries also. If wet moss be kept on the top of the pot to counteract this, the leaves soon turn yellow.—Ed.]

FIG. 4.—BRANCH OF JERUSALEM CHERRY; FRUIT SCARLET.

### How to grow the Jerusalem Cherry.

One of the commonest ways I have run across of growing the plant is to treat it as an annual. Seeds that are saved in the fall or winter are sown in the spring, and the young plants are bedded out in May, and are lifted and housed in September or October. This might be called the slipshod, as it certainly is the easiest course imaginable. One of its prime faults is that even though the seeds are secured from the finest fruited specimens, yet the flowers of such were subjected to the pollen of the collection with the chance that the new crop will show plenty of inferior plants, owing to the indiscriminate fertilization of the flowers.

A much better way to raise the plants is to do so from cuttings. In that case one need not work in the dark, for you may know just what you are raising. As stock plants, choose the finest specimens at your command. In making the selection, look quite as much to the habit of growth as to the beauty and abundance of the fruit. In some plants the fruit is of better color than in others, ranging in this respect from a dull yellowish red to bright scarlet. The wise grower will, of course, choose the latter.

What I shall here recommend is the two years' course of culture with the plants continually in pots. The cuttings are

As a house plant the Jerusalem cherry is by no means to be despised. It is of easy growth, thriving well, even though it has not the lightest place in the room. The deep green lanceolate leaves are always pleasing, and the more so when brought into contrast with the scarlet fruit. The fact that the foliage possesses some odor can hardly be classed as an objection, when not more than one or two plants are grown in the window. Some persons enjoy the odor. There is a form of this species which has leaves that are variegated with yellowish white, but as the fruiting propensity is lessened thereby, it has never become a wide favorite.

It adds to the interest of the plant to know that it is a native of Brazil, and not of Jerusalem, as some, from its popular name have thought. A near relative, however, is a native of Palestine, and is there known as Apple of Sodom.

Altogether the Solanums are a most interesting and extensive family of plants; the botanists include in the genus about 700 distinct species. Those both useful and ornamental fruit bearers the tomatoes, peppers and egg plants are cousins. So is the even more valuable potato, the plants of which, it will be recalled, also bear fruit.

Quite a number of species besides the main subject of this sketch, are classed among purely ornamental plants. Among

**The Canadian Tariff.**—On December 18, James McKenna, on behalf of the market gardeners and florists, appeared before the Canadian Tariff Commission, and asked for protection against the green vegetable products of the south, which came in in large quantities, just at the time the Canadian product came on the market. While the present duty was protective, it would be more so if changed from ad valorem to specific, at so much per pound, as when the American goods were sent in at a low price the ad valorem duty was not much of a protection. He also wanted the duty on cut flowers and florists' plants rearranged. Roses, instead of paying 20 per cent., should pay a dollar per hundred, or 1c. a flower; Carnations, 50c. a hundred; cut Chrysanthemums, a dollar, and smilax, 10c. a string. Tomatoes now paid 10 per cent. ad valorem and 20c. a bushel; he suggested a change to 1c. a pound. This, he said, would mean protection to them for a couple of weeks in the spring, when the Americans flooded the market with their goods. On the other hand, the action of the Michigan State Horticultural Society in so promptly passing a resolution requesting Congress to place a tariff on Canadian fruits, nursery stock, florists' stock and garden truck, at least equal to that placed on like articles by them, gives eminent satisfaction to Port Huron gardeners, and now a movement is on foot to raise money to pay the expenses of a man to attend the meeting of the New York State Horticultural Society, which occurs early in January, and secure a like action by that Society. An effort will also be made to secure the co-operation of the gardeners and peach growers in Detroit and vicinity in the cause, as they are the greatest sufferers from the present unequal and oppressive tariff laws. Thos. Hoffman has charge of the matter in Port Huron. The present Canadian tariff on our small fruits going into Canada is 2c. per pound; on peaches 1c. per pound; on all florists' stock, garden truck, etc., 20 per cent., while all Canadian stock is admitted free.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

Growers and Specialists ARE heartily invited to co-operate with the editor in presenting to his readers facts of interest relating to the successful culture and marketing of fruits and vegetables. Both of these subjects are of vital importance, and advice from those who have had experience will be eagerly read.

How best to develop the home market so that sales may be made direct to consumer, or to transact them through intermediaries who will ensure to the grower satisfactory and full returns, is a question which is open for discussion, and we trust to see the financial end of the business very thoroughly argued in these columns during the year just commencing.

Intensive Cultivation the A NEW line has been inscribed under the title of this paper which is intended to convey, as modestly and in as few words as is possible to give it the scope of action on which AMERICAN GARDENING takes its stand for the future.

Through the practice of intensive cultivation the operator secures the best crops, of the sorts most in demand, in their finest state of perfection, for which he receives the highest prices in the best markets. The soil which he so unremittingly cultivates never lies idle; it is

made fertile and kept productive; its yield is the result of systematic application bringing about full fruition.

Condensed to a definite conclusion, intensive cultivation is the confining of one's energy to the undertaking of those things only which can be carried through to successful termination. Thus, we argue that it ensures better returns to thoroughly cultivate and care for say five acres, than to attempt to control one hundred acres without the equipment, men, and money necessary to attain the full measure of success which could otherwise have been secured. It shall be our endeavor to keep our subscribers informed of every development in this line; to obtain for them the experience of skilled growers and specialists; to keep them posted as to new varieties and methods. But the work must not stop here. The grower occupies the same position as the manufacturer; his produce may be ever so superior but unless he knows how when and where to market it his labor is one-half lost. Hence, he must study the disposal of his crops to the fullest advantage just as closely as he does that of their growth. Here, too, AMERICAN GARDENING will come to his assistance with all the influence at its command.

While thus engaged on behalf of the commercial grower it is by no means our intention to drop those features of this paper, which have in the past made its columns so attractive to the advanced amateur. On the contrary, this section of our readers will find AMERICAN GARDENING in 1897 of more value to them than ever before in that it will jealously guard their interests, and strive to retain that pre-eminence in their opinion which it is satisfied it now possesses over all its contemporaries.

That a happy and prosperous New Year awaits all its friends is the sincere wish of AMERICAN GARDENING; may 1897 bring us all that measure of success which our efforts deserve.

## The Package Question.

When crops are high the cost of the packages in which they are sent to market is very little noticed, though there is no reason why it should not be, if one is fruit growing, for instance, in a business-like way, and on a business basis. But when the crop brings a low price, the cost of the package becomes a serious matter, often reducing the receipts to the bare cost of production, if not below. This matter has been forcibly brought home this season to the county in which I live. Kennebec is the great apple county of the State of Maine, 19,000 barrels having been shipped in one season out of one little town in it for export alone, to say nothing of the thousands of barrels that were shipped to domestic markets from the same town. We had a large apple crop the past year, and the price has not ruled

above \$1.25 per barrel, delivered at the station, while "seconds" have ruled at 75 cents a barrel. The barrels cost 25 cents apiece. This gives 50 cents a barrel for growing, harvesting, packing and delivering seconds to the station, and \$1 net as the highest price.

Now I am not prepared to say that apples cannot be grown here on our Maine hillside—the natural home of the apple—for \$1 per barrel, and return a fair thing to the grower. That is not the question at all. The fruit grower ought to have all the profit possible, whether the ruling price be high or low, and as matters now stand he is kept from a considerable part of what ought to be profit by the cost of the package, and this is true not only in the case of apple grower, but of the peach grower and the grower of small fruits as well.

I am naturally interested most in the apple-package question, and am anxious to find a way to decrease the cost of these packages, for such a decrease would mean thousands of dollars saved yearly to the orchardists of my own county alone. A barrel, from its peculiar form, and its manner of being fastened together, is much more expensive to manufacture than a rectangular package holding a similar amount.

Take, for instance, the rectangular crate that brings our oranges from Florida. A two-bushel package of that sort could hardly cost above eight cents to manufacture, and it serves its purpose admirably. Such a rough, light, but strong crate, lined with heavy packing paper, could be filled as tightly, and carried as safely as the barrel, and the cost, allowing liberally, ought not to be more than half as much as the cost of the latter. Twelve and a half dollars saved on every hundred barrels of apples would well be worth looking after, especially where the grower has anywhere from one thousand to three thousand barrels of fruit to dispose of.

I am confident that the man who will spray his trees intelligently, prune and feed them, thin and carefully gather his apples, and as carefully pack the very finest in two bushel crates, will be able to establish a fancy trade that will bring him in very satisfactory results. It might be found profitable to buy an orange-wrapping machine, and wrap each apple in tissue paper, with the grower's name upon it, but I am doubtful of this.

Grown and packed as I have suggested the fruit would appeal to a class of buyers who would think of a barrel of apples as something common and like the general run of fruit. A crate of fancy apples appeals at once to a fastidious buyer (and such buyers are the ones willing to pay the highest prices) as something choicer than that sent in the usual way. Crates, moreover, could be made at home in leisure moments, and the cost still further reduced.

WEBB DONNELL.

[The suggestions conveyed in Mr. Donnell's article may contain germs of value, and we trust to see the "Package Question" taken up by others.—Ed.]

## What Our Advertisers Say.

"The plant trade through my advertisement in your For Sale column was quite satisfactory. I am satisfied that AMERICAN GARDENING reaches a class of people who are buyers."—ALLEN D. MANWELL, Iowa.

"From inquiries received, we think we have acted 'just right' in placing AMERICAN GARDENING on our list."—BATEMAN MFG CO., N. J. Manufacturers of Farm and Garden Implements.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions.

**Habits of the Bean Weevil.**—I fear your Schenectady, (N. Y.) correspondent, whose letter regarding the habits of the bean weevil was published in the December 19 number, page 808, is not fully acquainted with the ways of that little pest. He has two kinds of soil in his garden, a sandy loam and a heavy loam. Beans grown on the former are infested by weevils, while those on the heavy loam are free from them. I have no doubt as to his facts, but I do question the soundness of his explanation. He probably plants his earliest beans on the light sandy part of the garden, and the later varieties or plantings on the heavy loam which is too cold and damp for very early working. If I am correct in this it is easy to see how he might be misled in his conclusions. According to my observations the bean weevil lays its eggs on the earliest beans in the garden or field. It then dies, as do most other insects after depositing their eggs, so that when the later varieties or plantings are in pod there are no weevils left to injure them in this way. My early wax beans, grown to be used as string-beans, if allowed to ripen seed, are almost sure to be heavily charged with weevils which come out the same season if the beans are shelled and put in a warm place. But late plantings, whether on light or heavy soils, are comparatively free from them. Of course, it is possible to have weevils in late beans if lively, mature weevils are at large when the pods are in condition. One may let loose a colony of them which have been shut up where they could not get away earlier in the season. Your correspondent's cucumber experience, it seems to me, is in the same line. The "striped bug" does the most harm in early summer. Late cucumbers are far less likely to be injured than early ones whether grown on heavy or light soils.—A. W. CHEEVER.

**Flowering of Epiphyllum.**—I had always supposed from experience and observation that the *Epiphyllum truncatum* bloomed but once a year, in November, but having lost one a few years since, procured another, and it has each year bloomed until quite into the winter, is still in blossom at this date and has eight buds in different stages of development. I see that Henderson says, in his handbook of plants, that with good care it may be kept in flower from November until March. I do not know of any special care mine has had, but if there is any that will cause it to so bloom I am sure it would give your readers pleasure to know it.—H. O. T.

[There is no special treatment, it is just a question as to how the flowering growth may happen to ripen that is all; the flowering period is from November to March.—ED.]

**Select Hardy Shrubs Wanted.**—Can you give me a list of hardy shrubs and Evergreens, such as *Rhododendrons*, *Azaleas*, etc., different from the ordinary natives usually grown, and which will stand the winters of this climate, which is similar to that of Northern Wisconsin.—AMATEUR, Toronto, Ont.

**Remedy for Green fly.**—I frequently see inquiries in regard to the destruction of aphids on plants in your publication, and a remedy which I have used for some years with perfect success never mentioned, namely Persian Insect Powder. I had given up the growth of several plants, among them the *Pelargoniums*, on account of the

pest, when I was told of this remedy, and have never seen green fly on the plants since, or on the *Carnation*, which is also subject to them. If the plant is infested with the fly I use it directly upon that and on the ground until the pest is destroyed, then simply puff it about the house once or twice a week, just as I would to rid a room of flies in summer.—MRS. H. O. TALLMADGE.

**Wholesale Fruit Prices.**—I like your journal. There are over a dozen fruit growers' papers coming to my desk, but none suit me as well as *AMERICAN GARDENING*. I like to see a diversity of topics from many sources. The prices that fruit is selling for in many of the eastern markets would be of interest to western fruit growers.—B. F. S.

[We expect shortly to quote prices for fruits and market produce at the largest trade centers, and expect these reports to become one of the most valuable features of *AMERICAN GARDENING*.—ED.]

**Old Asparagus Roots.**—Have any of your readers had experience in transplanting old asparagus plants or roots? I should think if closely trimmed they would answer as well as young roots.—A. T. G., W. Washington, D. C.

## The Vegetable Garden.

**The Past as a Guide.**—At the present time little can be actively done in the vegetable garden, but the busy season will soon be upon us, and it is good policy to prepare the way by having all our thinking and planning done now. A very useful habit to get into is that of keeping a brief, though correct, record in our own words of all our gardening operations for the year, our failures as well as our successes, the time of sowing the seeds and their maturity, how the manuring was done, how deep we dig or plow the ground, and any other data that may come to our notice. It is a practice to be encouraged, as it cultivates our powers of observation; we thus learn to grasp the minutest details, and in this way become enthusiastic and more intimate with our work. It is also invaluable as a guide to future operations.

**Practice Rotation.**—In these days of blight, insect enemies and innumerable diseases to which vegetables are subject, a complete system of rotation of crops should be followed as a preventive, and also for the reason that vegetables succeed better when a change of ground is given. Therefore, we should make our plans now, assigning a place for everything; even before we make up our seed list, so that when the busy spring comes we will have no need to stop to think, for we know exactly what, when, where and how to plant everything.

**The Manure Heap.**—The manure heap should be looked after and taken care of. The usual method is simply to let it stand just as thrown from the stables. The ammonia being a volatile gas, escapes to the atmosphere and is lost; the heap is liable to fire-fang, thereby destroying a large percentage of its value for plant food. To prevent this we spread the heap evenly at least once a week, and then sprinkle plaster all over the heap and around the stables. Used in this way plaster is invaluable to fix the ammonia. Some attention should be given to the liquid drainings of stables and manure heaps, and some method adopted to retain these until they can be used on the various crops. It is a most valuable form of manure, and being in solution, can be immediately assimilated by plants, if given to them during the growing season.

W. M. EDWARDS.

## Small Fruits for Northern Indiana.

This was the subject of a paper by J. C. Grossman, which was read before the recent meeting of the Indiana State Horticultural Society. Mr. Grossman prefers a rich sandy loam, and applies twenty loads of stable manure to the acre. He sets plants in the spring.

Speaking of varieties of strawberries, he said, Haverland is the most productive variety; Wolverton is large and good quality; Bubach soft, but large; Warfield ranks first as a shipper and canner; Bederwood is a good fertilizer and productive; Greenville, good in quality; Parker Earle requires very rich soil and plenty of water; Marshall good, but shy bearer; last and best is the Brunette, rich red, and the sweetest berry he ever tried. Nemaha is a strong grower and one of the best black raspberries. Shaffer's Colossal is the best for canning. Golden Queen is better than Cuthbert. In blackberries, Snyder succeeds best with him. Mr. Van Deman said the Brunette excelled all others, in his opinion. It is of best quality and a good bearer. Mr. Sedgwick recommended the Eureka raspberry as one of the very satisfactory kinds, large and productive.

Mr. Newton was not pleased with the Loudon; it is not better than Cuthbert. Mr. Willard thinks Loudon a promising variety, one of the largest and best.

## Stark County (O.) Horticultural Society.

—At the last monthly meeting, the election of officers resulted as follows: Joseph P. Hayhurst, president; Alfaretta Sayler, vice-president; Margaret Rockhill, secretary; Watson Wise, treasurer; John F. Roth, Peter J. Palmer, and Michael Bitzer, executive committee. The next meeting will be held on the third Wednesday in January, 1897, at the residence of John Roth, three miles south of Canton.

**A Botanical Garden for Brooklyn.**—A local paper in an editorial asks the question: "Why cannot Brooklyn at least make a beginning in the direction of a comprehensive botanical garden? It will be objected that the funds are not available for such an undertaking, which is doubtless true, but a beginning might be made, and in time, as the public realized the great value of such a garden, in imparting a knowledge of plants, the money necessary to extend it would be forthcoming." Another reason is, in view of the establishment of the New York Botanical Garden, which will undoubtedly meet all the requirements of Greater New York, it would be a useless expenditure of money. In the meantime, let the authorities and good citizens of the City of Churches devote their spare wealth and energy to the very laudable object of providing more small parks for the people, a subject now under consideration.

## Fertilizers for Window Garden Plants.

At the Farmer's Institute meeting, held in Horticultural Hall, Philadelphia, Saturday, December 10, Dr. Frear, in a talk on "Commercial Fertilizers," gave the following formula, suited to plants in the window garden: Five ounces sodium phosphate, seven ounces sulphate of potassium, six ounces nitrate of sodium. Mix and dissolve one ounce in 28 quarts of water, using only a very little of the solution in a great deal of water to wet the earth of the plants once in a while. Care must be taken not to wet the foliage.

## Ornamental Gardening.\*

There is scarcely a more fascinating employment than the planting and care of ornamental trees and shrubs. After we have planned our landscape, even though it have small pretensions, and have gotten what assistance, perchance we may from the journals, or possibly from observation or advice from some well-informed neighbor who has planted before us, we make our selection, and at this time we see with our mind's eye that which later we may truly realize, the buds starting forth in spring, the full leaf forming a shady canopy, and later the beautiful blossoms bursting forth in all their beauty and fragrance, and then the thought comes that this is all our own. We shall enjoy these luxuries, and more than this, our friends shall enjoy them with us. Our children shall be educated with such surroundings and a refining influence shall be exerted by them in our home. These pleasures shall not be evanescent, but the tree and the shrub will continue to improve in its beauty and usefulness. They shall cheer our lives and those that follow after us. Well might we

"Thank God for the beautiful flowers  
That blossom so sweetly and fair."

True indeed it is that we should plant for fruit also and cultivate the soil for food and profit, but let us not forget that we have minds to feed and roughened natures to refine and cultivate. Henry Coleman, the distinguished agriculturist of Massachusetts, once wrote: "When I hear a man ask 'what's the use of flowers?' I am always tempted to lift his hat and see the length of his ears."

But we ask, How to plant and care for our home plot? One of the first things to do is to make a lawn, for no place, even though it be small, is complete without this. It is restful to the eye; all the varied colors of nature are shown best in a setting of green. When properly kept a lawn is clean and healthful. How much better a velvety green sward than barren looking and burning sand, or the disagreeable dust blown from a clay soil during a drought. When I first came into this section, about 15 years ago, as an expedient I gathered the small tufts of grass I found growing in my vegetable garden and transplanted them to a place where two walks came together forming a triangle of about 6 feet on a side. I cared for it, and the comfort I took sitting on my own original grass plot was something bordering on the exquisite. It brought me back, in memory, to the old homestead in the North, where as a child, I had frolicked on the grass under the shade of Maples, or when tired, had rested beneath the shade of a huge Balsam Fir. These things were not appreciated until, when without them, my handkerchief lawn brought me under the spell that carried me back to my boyhood home.

In the making of a lawn we should bear in mind that different localities require different treatment, but any place where a good garden can be made will be adapted to the growing of lawn grass. First the soil should be plowed to a good depth, and if it is stiff, subsoiling would be found beneficial. Drainage with tile is recommended when the location or character of soil demands it, and the land should be well fertilized. Generally a complete fertilizer containing the three elements, potash, nitrogen and phosphoric acid is the proper thing to use.

Well rotted stable manure, especially that made where a cow has been kept, is

as good, if not the best of anything, but personally I would object to stable manure on account of the weed seeds it contains. The manure should be worked well into the soil and the plot should be harrowed or raked into a fine tilth before the seed is sown.

In sowing the seed a time should be chosen when the air is quiet, generally early in the morning or after sundown, the seed should be mixed with about three times the quantity of dry sand or light soil, and in sowing, the plot should be sown one way and then sown across at right angles to this to get it evenly distributed. Sow with rather a lavish hand.

Now rake in lightly and wait for the early and later rains. I should sow close around all shrubs or trees that may be there, afterwards cutting out the turf made, using it to patch up any bare spots that might occur in the lawn.

After the grass has assumed a good growth, but not too high for the lawn mower, let the machine be put at work and use it at intervals during the growing season, the length of the intervals depending upon the season and growth of the grass. I should always leave the cut grass on the lawn as a mulch.

Using the lawn mower is one of the most effective ways of keeping the weeds from seeding. Most of them are annuals, and can thus be killed in one season. The lawn should be fertilized to maintain growth, and it is well to do this every spring and fall. Sowing on a good coat of cottonseed meal is excellent. Potash in the shape of wood ashes or ground kainit is good. Ground bone or acid phosphate is also good. It is often the best plan to lay off and cut out the walks after the lawn has been made, using the turf thus cut out to patch up bare places.

The straight walk leading from the street to house should scarcely ever be made unless the house is very near the street. It may almost be said that Nature abhors straight lines, and in all landscape work we should try to follow her teachings. Therefore curves should be used, not too exaggerated, but approaching the house or other object by about the nearest course. Some, so-called, "landscapers" have mutilated what otherwise might have been handsome places by using the corkscrew or Jacob's ladder style of walk, which, when put into practical use, was less than half used, the remainder of the walk being worn straight through the lawn. A good rule is to make only walks that are necessary to reach places that are frequently sought, as all others can be reached by walking across the lawn, and no lawn should be so precious that it cannot be used to walk upon occasionally.

Before we are ready to set the plants, shrubs, and trees in our grounds, we should inform ourselves as best we can, considering our time and means, as to their habit of growth, their size when at maturity, and their rapidity of growth in our climate and locality. A close perusal of some of the catalogues of our largest nurserymen and florists will give us a fund of information that will help us much, as a number of them are not only works of art, but veritable encyclopedias of plants and plant growth. A close perusal of a good horticultural journal in its successive issues is one of the sources from which to glean information.

On small places it will be necessary to use the smaller growing shrubs and trees, or if our place consist of only a small front door yard we will be confined to the use of a selection of herbaceous

## War

Is declared by Hood's Sarsaparilla upon impure blood and all its disagreeable symptoms. By purifying the blood it cures rheumatism, neuralgia, scrofula and catarrh, and gives vitality.

## AMERICAN GARDENING AND THE OHIO FARMER,

Both One Year Each for only \$1.00.

THE OHIO FARMER is a large, 30 page weekly, \$1 per year. A National Farm, Stock and Home Journal, and is clearly the Leader of the Agricultural Press of America. It pays more for illustrations, correspondence and Market Reports than any other of its class.

It is the Best and Cheapest news more than others. Send for a SAMPLE COPY to THE OHIO FARMER, Cleveland, O.

THE OHIO FARMER will start their paper the date the order is received by them, and continue in Jan. 1898-14 months, if ordered at once. Address all orders to

AMERICAN GARDENING, P. O. Box 1897, New York

\*Read at the meeting of the N. C. Horticultural Society August 20, 21, 1896, by Dr. G. H. Sadelson, Supt. of Parks.

perennials or small shrubs, or possibly some beds of annuals, although the latter, perhaps, are best planted in a flower garden proper. In larger places it will be permissible to use more or less of the larger shrubs and trees, and it is here we will have to use the greater skill and care. We should always plant for effect, but the effect should be a natural one.

The grouping of trees is a most effective way of producing natural beauty, selecting our subjects to make a contrast in form and color, not forgetting the colors which are produced in autumn when the trees are dressed in gala attire. We should seek to have large open vistas of lawn, which might be bordered first by flowering and decorating plants, then behind these and rising higher, low growing shrubs, and still behind these the lower growing trees, and then the higher trees, if the grounds are sufficiently large to justify it. Let the sky line formed by the tree tops be a broken one as you view it from a distance.

In selecting our varieties we should have in mind our deciduous trees and shrubs and herbaceous perennials for summer effect, and the coniferous and broad-leaved evergreens are useful to give color to the landscape in winter. Vines should have a prominent place in ornamental gardening. A summer house or arbor, when permissible, should be built and covered with vines. In my opinion, vines should be trained on a house but seldom, unless it be a stone or brick house, as the dampness that is retained by the foliage will soon cause the wood to decay, and, moreover, it is unhealthy to the inmates. The same might be said in regard to trees or shrubs placed too near a dwelling. People, like plants, need sunshine to make best development.

Now the people of this State are favored more, I believe, than most of them know in the wonderful variety and beauty of the plants, shrubs and trees that can be used to ornament their home grounds. Situated as we are in the middle of the temperate zone it can readily be seen that plant life that would succeed here would cover a territory reaching far north and south of us.

It may be urged that to embellish our grounds to any extent would necessitate quite an outlay of money as stock of this kind bought of reliable nurserymen is quite high. Without waiting to disprove this assertion, which is truly more fanciful than real, I would affirm that the poorest need not leave their surroundings unadorned. The fields and forests in the vicinity of each home and in all parts of the State will furnish material of sufficient variety, beauty and quality to add greatly to the beauty, comfort and value of each one's home plot, and they are to be had simply for the labor of digging and transplanting. Some idea of the truth of this statement can be had by reading "Curtis' Woody Plants of the State of N. C.," which is furnished by the Board of Agriculture. Why should our yards be barren wastes or disfigured by a few badly planted, illy cared for specimens that are only cultivated by the busy hen as she scratches for food around their roots for her attendant chicks? Why not have our own vine and shade tree to sit under, a green lawn, a shrubbery, or the cool rest of a vine covered summer-house rather than be forced to seek such comforts elsewhere? A little work that is fascinating, a little waiting that is constantly tinged with expectant pleasure, and these things are ours; and they are a legacy, always vernal, that shall be left by us to those who follow. Let

us change the phraseology of the golden rule somewhat, and apply it practically in our own home grounds. Plant for others as you would that others had planted for you.

"Give fools their gold and knaves their power;  
Let fortune's bubbles rise and fall;  
Who sows a field or trains a flower,  
Or plants a tree, is more than all."

### The Apiary.

**A Suggestion.**—A good many bee-keepers have complained of late years of the low price they have been getting. The question of profit depends upon the difference between the cost of production and the price obtained. We cannot regulate the markets to any great extent, so why not, instead of complaining about them, study to lessen the cost of production? This is in our own hands, and now is a good time to study the matter. So long as any product is put on the market, year after year, at a certain price, however low, we may be certain someone is producing it at a cost low enough to still make a profit, and as long as we must sell at the market price, we must produce a better grade, or at as low a cost as anyone, or quit the business.

**A Tool House.**—For small apiaries of but a few hives, and where lack of space renders it inadvisable to provide a regular honey-house, an outdoor cupboard or chest, with regularly constructed roof and water-tight sides, should be set directly back of or among the hives. This should stand up two or three feet from the ground, and by tacking sheets of tin about the supports it can be made safe from mice. Fit the inside with shelves or trays for holding smoker, veils, knife, hammer, separate pockets for three or four different size nails, sections, etc. This can be constructed now and set up in the spring. A hand-tray for conveniently carrying a few tools is a very handy thing. It may be fitted in as one of the shelves, and such things as the smoker hammer, knife, and a very few nails kept in it habitually. By fitting a door of wire cloth before another shelf, a very good temporary storage can be made for honey while removing sections, and several trips to the more distant permanent storeroom saved. If well-arranged, such a contrivance will hold a surprising number of tools, etc., will not cost much and will occupy but little more ground space than one or two hives.

WILDER GRAHAME.

**Germantown, Pa.**—At the annual meeting of the Germantown Horticultural Society, the following officers were elected to serve for the ensuing year: President, Jonathan Jones; vice-presidents, Charles J. Wister, Albert Woltemate, and John S. Hart; secretary and treasurer, George Redles, Jr. After the election Albert Woltemate gave an interesting talk on "Chrysanthemums and Carnations."

**Pennsylvania Horticultural Society.**—The following officers have been elected for the ensuing year: President, Clarence H. Clark; vice-presidents, Robert Craig, Charles H. Miller, and Dr. Geo. Goebel; treasurer, Wm. F. Dreer; secretary, David Rust; professor of botany, Thomas Meehan; professor of horticultural chemistry, Dr. Persifer Frazer; professor of entomology, Rev. Dr. C. H. McCook; executive council, Edwin Lonsdale, John Burton, David Bearn, Joseph Heacock, Thomas Cartledge, Henry F. Michell, and John Westcott.

AMERICAN GARDENING is one of the best papers that comes to the department.—AGRI. EXP'T. ST'N, Columbia, Mo.

Your anxiety is for your delicate child; the child that in spite of all your careful over-watching, keeps thin and pale. Exercise seems to weaken her and food fails to nourish. That child needs Scott's Emulsion with the Hypophosphites—not as a medicine, but as a food containing all the elements of growth. It means rich blood, strong bones, healthy nerves, sound digestion. No child refuses Scott's Emulsion. It is pleasant and palatable.

SCOTT & BOWNE, Chemists, New York.

### EXTRAORDINARY OFFER!

#### The Youth's Companion

to 1898, including the Christmas, New Year's and Easter Double Numbers for two years, the Twelve-Color Companion Calendar for 1897 (the most costly gift of its kind THE COMPANION has ever offered), and

#### American Gardening,

Both papers to Jan. 1, 1898, for only \$2.00 in advance.

Above offer is for new subscriptions only to both papers.

YOUTH'S COMPANION (new) and AMERICAN GARDENING (renewal), including all the above to Jan. 1, 1898, \$2.25.

YOUTH'S COMPANION (renewal) and AMERICAN GARDENING (renewal), including all the above to Jan. 1, 1898, \$2.75.

Address your orders to

AMERICAN GARDENING P. O. Box 1897 NEW YORK.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### The Fragrant Daphne.

No plant I have had gives me so much pleasure for the small amount of care I give it. When it is past bloom I tuck it away in the cellar, dark as it is. With the coming of spring I set it, box and all, out into the sunshine, and water it when I can. It has not been repotted in three years, yet it always blooms.

### Is the Soil Wet?

The size and quality of the receptacles make so much difference as to the retention of water in the soil, that these must always be considered before applying any specific advice about watering. In a warm room, with plants in small pots, it is uncertain work trying to keep geraniums, for instance, "on the dry side" without letting them become killing dry. If, on the contrary, the room is not so warm, the sunshine less, or the pot six inches across, a medium-sized plant is much better kept as dry as the average flower-conscience will allow; perhaps a little drier would be better. It is practically impossible to lead the majority of window gardeners to employ pots really small enough for the size of the plants. It is therefore only the heat of stove and sun that save the plants from utter extinction, since a regular amount of water, at least every other day, is conceived to be a necessity. This conception is *all wrong*. Water when needed; regular watering may be death to the plants.

### Fine Clusters of Narcissi.

Beauty and fragrance are very much in evidence when a single cluster of *Narcissus* consists of 14 or 15 large and well opened blooms. One such specimen pot of Giant White *Narcissus* is in bloom at present. Such a show is very seldom secured in the dwelling because of the too high temperature. This bulb was removed from 68° to 40°-55° as soon as two or three blooms had opened; otherwise the first flowers would have faded some time before the last were ready to open. The largest blossom in the cluster measures a plump inch and three-quarters, and the whole makes an ordinary "Paper White" near-by look quite insignificant. Paper White *grandiflora* comes perhaps about half way between the two, as to size, as we grow it. The occasional bulb throws two fine clusters.

### The Coming Freesias.

It is about neck and neck with the California and the home-grown *Freesias*. Both were potted during the early weeks of September; both have been kept in a chimney-heated room, with a temperature of 50° to 60°; both are showing buds. The home-ripened bulbs are the ones which, last spring, were subjected to several weeks of roasting in a sunny south window, after being dried off as usual. The comparison of these with the wonderful new California giants has been most interesting. Growth has been about equal, except that the latter are a trifle shorter in foliage. Both are doing unusually well. Few indeed are the flowers which give equal pleasure with well-bloomed *Freesias*.

### Choice of Varieties in Carnations.

About as pretty a sight as one could ask was a full house of Daybreak *Carnation*, seen last week, the clean, rank, well-opened plants bearing a heavy crop of buds and bloom, every blossom nearly being fit for

exhibition. As between the exquisite pale, clear color and perfect form, and the deeper rozier pink of Wm. Scott, few would hesitate an instant to declare in favor of Daybreak. Yet the grower shook his head. "It isn't so good as Scott," he said. "It takes too much work to keep it clean, and it don't crop so well." This is a greenhouse view, let it be remembered, a view colored highly by the thought of resultant dollars and cents, a wholly practical view. But probably the stamina of Scott would be in its favor even in the home window. Della Fox is a new beauty of grand size and color, but too tall for window work.

### Grading the Dealers.

Usually it is the dealers who grade their goods. But the buyer may grade also. Yesterday a firm whose name is as well-known as that of New York itself, was asked concerning the novelties for next season. "Don't know that we shall put out anything especially new," was the reply, "unless it is a Rose." This brought to mind the thought that it is quite worth our while to study the business methods of the catalogue makers, as a guide to our own future grading of and dealings with them. They fall naturally into three classes: the conservatives, who seldom touch novelties until they cease to be really novel; the hustlers, who manage somehow to get hold of really valuable new things, more or less, each year; the keep-away-froms, who use grand flourishes and superlative adjectives to push things either worthless in themselves, or really desirable old things under strange new names and at strange, impositions prices. With which shall we deal? We may know them by their catalogues.

### Warfare on Lice.

That the poultry world, as well as the rest of the world, is progressing, may be learned from the advertisers. Just of late a whole crop of these has sprung up advertising, each under a different name, a new liquid lice-killer. The value of this preparation lies in the fact that the dropping boards and roosts may be painted with it, and the fumes attack all insects within reach, on roosts or fowls. It is claimed that the new stuff kills all lice present, without harming the fowls, if used as per directions. Several people are selling recipes for making it, and best of all, a prominent poultry paper gives the recipe gratis to its readers. The word "it," as used above, of course implies that all these preparations are practically the same. It is not surely known that this is so, but the inference is thrust upon one.

### Calcareous Nest Eggs.

Some one writes one of our poultry papers that he has "conceived the idea" of making nest eggs by filling empty egg shells with liquid plaster of Paris, which soon solidifies. Other people have had this idea years ago; but, when worked out, it is lacking in satisfactory results. The hens soon find the small exposed portion of the filling, and begin pecking at it. It disintegrates easily, and soon the eggs are about as good as so many unevenly shaped stones. The China eggs are now worth at the east less than the eggs which the hens lay. They never lead the fowls on to peck at the eggs until they become egg-eaters. They are lasting, and in every way the best for the purpose to which they are devoted.

### Crowded Roosts.

Those who have the ability to learn from the experience of others (a rare and fruitful quality), may be cautioned as to crowded roosts. Unless forethought heads them off, fowls will always crowd to those positions which seem to them most desirable (such

## "Mend it or End it,"

has been the rallying cry of reform, directed against abuses municipal or social.

For the man who lets himself be abused by a cough the cry should be modified to: Mend it, or it'll end you. You can mend any cough with

## Ayer's Cherry Pectoral.

are the thin-edged perches, the high perches, the back perches). Anticipate and prevent this action by making perches  $1\frac{1}{2}$  x 3 inches, or 2 x 3 inches, and setting them on edge; by placing all perches at the same height; by taking care not to have merely two long, narrow roosts, but rather a compact block of perches. It all means practical results in the egg-basket, as, if the birds crowd, some are sure to grow weakly from this cause alone. Then, too, the central ones may be dripping with moisture one night; the next night they may be on the outside, cold and shivering; the next day sneezing with roup.

### Applying Fertilizers.

A warning we are all familiar with, but which comes more forcefully when coupled with a reason, is put this way: "It is useless trying to feed a plant up until the soil is well occupied, as it only sours the soil."

MYRA V. NORRIS.

**Good For His Last Dollar.**—Your paper is the best of anything I have ever found. Shall stay with you as long as I can raise a dollar.—A. B. C., Mass.

ANY subscriber to *The Rural New Yorker* may have all his money back in three months if he is not satisfied with the paper. It does not want any man's dollar unless it is able to render that particular man a dollar's worth of value in return. We will send it and AMERICAN GARDENING both one year for \$1.80.

FOR \$4 we will send *Leslie's Weekly* (formerly *Frank Leslie's Illustrated Weekly*) and AMERICAN GARDENING to any address, one year. *Leslie's* is one of the most attractive of New York's numerous illustrated weeklies, and its subscription price alone is \$4 a year; therefore, it will be seen that our offer is a very liberal one. Address your orders to AMERICAN GARDENING. Sample copies of *Leslie's* on application.

In all the States of the Missouri Valley, consisting of Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota and South Dakota, the largest circulation credited to any publication devoted to agriculture and dairying is accorded to the *Woman's Farm Journal*, a monthly, published at St. Louis, Mo., and the publishers of the American Newspaper Directory will guarantee the accuracy of the circulation rating accorded to this paper by a reward of one hundred dollars, payable to the first person who successfully assails it.—*PREFERS' INK*, April 29th, 1896.

## The American Kitchen Magazine

A magazine for every up-to-date housekeeper. The suggestions contained in a single number are worth more than a year's subscription. Price, \$1.00 a year. Sample copies free. **SPECIAL.**—We will send AMERICAN GARDENING and AMERICAN KITCHEN MAGAZINE, both one year, to any address, for \$1.50.

The most complete establishment of the kind west of the Mississippi River.

Price, \$30,000.

Address Messrs. **VARNUM and HARRISON,** Counselors-at-law,  
62 William street. New York City.**PRIVATE GARDENERS.**

We solicit for publication under this heading notes on the work being done by private gardeners, changes in appointment, and all matters of interest to horticulturists generally.

**Lenox, Mass.**

At the regular meeting of the Gardeners' and Florists' Club, held recently, the following officers were elected: President, John White, of Pittsfield; first vice-president, Edward Dolby, of Dalton; second vice-president, William Griffin, of Lenox; secretary, J. G. McArthur, of Pittsfield; treasurer, Frank Howard, of Pittsfield; guard, George Neal, of Pittsfield; auditor, Thomas Campbell, of Pittsfield; executive committee, John White, T. T. Connors, J. G. McArthur, of Pittsfield, Edward Dolby, Neal Cobban, of Dalton, William Griffin, A. H. Wingett, George Thompson, J. F. Huss and P. J. Donahue, of Lenox.

vicinity of Hampton Court, at Ember Court Nurseries, which were established there by Cardinal Woolsey in the reign of Henry VIII. The elder Mr. Lewis was at one time proprietor of these nurseries, and well known as an expert on forestry and landscape gardening.

The subject of our sketch, after receiving a thorough training in all departments under his father, carried out some large operations for Lord Roslyn, and on Lord Vernon's estates, and early in the seventies came to this country, and was for eleven years in charge of the Virginia State grounds and conservatories; relinquishing that position he assumed charge of the famous Brook Hill estate, one of the finest in that state. He subsequently carried out landscape operations in Maryland, Delaware, and Pennsylvania, often in the mountain regions where his knowledge of forestry stood him in good service. Prior to his present position he had been Park Forester in Fairmount Park, Phila-

FIG. 5.—JOHN C. LEWIS, CITY FORESTER, PHILADELPHIA, PA.

**Poughkeepsie, N. Y.**

Dutchess County Horticultural Society. Mr. James Sloan, treasurer of the above Society, writes that all prize money due from the recent show has been paid, also all other bills, and that \$163 worth of property good for future use is in hand, and, better still, there is a good cash balance on the right side of the ledger. We are glad to be able to make this statement from the treasurer, and to show that this vigorous Society is prospering and wish it well for the year 1897.

**John C. Lewis.**

In the accompanying illustration is given a portrait of the City Forester of Philadelphia, Pa., the first holder of the office. He was born at Streatham, near London, England, and received his early training under his father in the

Philadelphia, and has made some great improvements along the famous drives, and beautified the landscape in many parts.

Mr. Lewis is retiring and unassuming in manner, but is held in high esteem by many who own large estates around Philadelphia. His advice being at times solicited by them. As City Forester he has charge of all the small parks throughout the city (some thirty in number), and also superintends all tree planting by the city. This phase of his work is likely in a few years to assume large proportions. The city will certainly profit much by having the services of one as experienced.

**New Jersey State Horticultural Society.**

—The twenty-second annual meeting of this Society will be held at the state house, in Trenton (court room), Wednesday and Thursday, January 6 and 7.

## The Plant Registration Bureau.

In reference to the proposed Plant Registration Bureau, to be under the control of the Department of Agriculture (see page 790, issue of December 12), the following letter is received:

The writer, without claiming to be either an expert or an authority in the plant world, has often felt the need of some more definite means of locating the value of fruits and flowers, than the descriptions offered in the catalogues of interested persons. The business of propagation and dissemination is in the hands of live men all over the world, and a more active and energetic lot, both in real practice and the exercise of their imagination, would be hard to find.

Now, in reference to this proposed registration business, let us take a hypothetical case. When I was a good deal younger there was a man in Pennsylvania intelligently interested in small fruits. He noticed that a certain strawberry, the 700th in the row, was a better one than the others, and he immediately began to propagate and boom it.

Suppose now that this Registration Bureau had been in full blast, and he had taken advantage of it. The first thing to do would be to send a lot of his berry plants to Washington for determination of their value. Then he would have to wait till his certificate came, if that was what he wanted, and if he did not want it, what was the use of sending the plants at all?

Now the Department would have to test the plant, and supposing it did, and that it proved a very good berry in the sand and climate of Washington, is that any guarantee that it would do well in the mountains of North Carolina, the levels of Louisiana, or the prairies of the Dakotas? The only way to determine that would be to send out plants all over the country, for if there is any one thing that is settled, it is that there is no plant in existence that will do equally well in all sections of our wide-spread country. By the time the reports came in and were analyzed, and the case made up and ready for certification, years would have elapsed. Suppose now that it was all that was claimed for it, which is possible, it is utterly impossible that it should be universally so; what good would his long-delayed certificate do him in a commercial sense? He had emptied his fish into the head of the stream, and they had gone to the ends of the river, and had proved a good food fish. If he sets his net now at his home does he expect a monopoly of his fish? If he does he will be disappointed. In the very effort of determining his find he has practically given it away. The writer claims to be fairly patriotic, philanthropic to a degree, and as honest as the times allow, but he is under no obligations to get a package of plants from the Department of Agriculture, test them, turn them around in various ways, and then when they have proved superior, dig the whole lot up and return them or burn them. On the contrary, if the plants sent me proved valuable in a commercial sense, and I had no contract with the party sending them, I would at once propagate and flood the country with them, while the Bureau was thinking about it and making up the reports. If you think this is dishonest, tell me how I am under any obligation to take your setting of eggs, hatch out a lot of "pee-pees," raise them, compare their weight, color, and all that, and then send the whole outfit back to you, whom I have never seen, and who will immediately use my name and certificate for your own personal benefit. I believe in reciprocity, and who is going to pay for all this experimenting?

If I have a plant that I believe to be an improvement on existing types, the last thing I want to do is to let it get away from me into the hands of people in the business, unless I want to say good-by to it.

I have taken the illustration of the strawberry as a plant that can be determined in a few years, but how about an apple, a pear, or something of that kind? A good part of a lifetime would be necessary to settle its value in any authoritative sense.

There is absolutely no other way on earth

to determine the value of a plant than by trial. The conditions that surround it make it what it is, and as these conditions vary so varies the plant. No set of men living can pass intelligent judgment any other way than by the widest trial. That the proposed Bureau can get a hundred different strawberries under a hundred different names and finally settle that there are only six of them at all different is entirely feasible, and it would be perhaps profitable in the long run to the general public.

That a plant could be "patented" is all nonsense. The law can protect the manufacture and duplication of a washing machine, but it cannot govern the outcome of a new bean put forth by anybody. Weather, soil, carelessness, and all that sort of thing are not amenable to the revised statutes. Then again plants "run out," and it is possible that there may be an accidental reduplication of some previously existing form, and the best method of discovering its identity is to let it loose on the general public instead of asking our Uncle Samuel to hold a quest on it.

I still think that my original suggestion of a Novelty catalogue a good thing, if it could be arranged properly between myself, the producer, and the buyer of seeds and plants. In the very nature of things it would be ahead of the Government from three to five years. It is well known that there are thousands of people who run to specialties; this year and next they raise Pansies, then they take to Roses, and so on. There is perhaps no one person living who gets all the catalogues of specialists, and it is next to impossible to do so. It is proposed to collect in one catalogue all the latest introductions under their appropriate heads, with the names of the propagators, thus showing at a glance where the best things are to be had and for how much money. Whether they were really the best of their kind could not be determined by any Government Bureau, though it might come trailing along with its reports sent through your Congressmen long after you had settled it all for yourself.

Union Co., Pa.

HOWARD MILLER.

**Western New York Horticultural Society.**—The annual meeting of this important Society will be held at Rochester, January 27 and 28. Mr. John Hall, of that city, is secretary.

**Salesman in Trouble.**—A traveler for Crane Bros. & Co., of Cleveland, O., wholesale fruit dealers, was arrested in Norwalk, O., on December 18, on the charge of obtaining money under false pretences. He sold goods far below their actual value, collected the bills as fast as the goods arrived, and then moved to another town.

**Bright Future for the Fruit Growers.**—President Hobbs, of the Indiana Horticultural Society, believes that the day of extravagant prices for fruit has passed, never to return. Unusually low prices ruled this year, he says, because spring opened simultaneously over a wide range of country, and because all kinds of fruit bore liberally. But he looks for a long period during which the happy conditions will prevail of plenty of fruit at reasonable prices for the consumer, and at remunerative prices for the producer. The reasonable price to the consumer, he says, is brought about by the cheapened methods of growing and handling, in the cheaper transportation; while the grower is to profit through wider markets, and the aid to be rendered in the distribution of fruit by the American fruit growers' union, recently organized. It is the purpose of this union to keep thoroughly informed as to the exact condition of the market and so control the shipping as to prevent overstocking the markets and breaking them down. "It would seem," Mr. Hobbs concludes, "that the energetic, intelligent fruit grower has as bright a future before him as anyone who tills the soil."

**GOING FOR  
WARNER'S  
SAFE CURE**

is much better than going for the doctor, and is quite as effective and costs less money. You need always at hand a safe, sure remedy like . . . . .

**Safe Cure**

which will bring instant relief from sudden illness and work out a permanent cure.

## The Most Useful of All

Our Premium Offers is that which follows:

AMERICAN GARDENING for 1896, unbound, 52 numbers, with the year's index, for only THREE (3) NEW subscriptions at \$1.00 each.

AMERICAN GARDENING for 1896, in good durable binding, cloth boards, half morocco, with the year's index, for only FIVE (5) NEW subscriptions at \$1.00 each.

This is a most liberal offer, and we trust our friends will appreciate it by working for the bound volumes.

AMERICAN GARDENING, P.O. Box 1897, N. Y.

## Questions Answered.

This is a Bureau of Information, to which subscribers can apply freely for advice on any and all subjects in the field of horticulture.

In order to lessen labor, and that the Editor and his friends may understand each other, the following rules must be observed:

### Rules for Correspondents.

Questions must be concise, plainly written on one side of the paper only, and addressed INQUIRY DEPARTMENT, AMERICAN GARDENING, P. O. Box 1697, New York City.

Letters appertaining to subscriptions, or other business matters, should be directed separately; otherwise delay may follow.

The name and address of the sender is required, in addition to a nom de plume. Use a separate sheet of paper, not a scrap, for each question. Questions will be attended to without delay. If by mistake a query fails to be answered, it should be repeated.

Specimens of plants for identification must be ample; mere scraps will not do, and no notice can be taken of such.

Questions relating to insects or diseased plants should always be accompanied by specimens, packed in a tin box, and forwarded at letter postage. Always send a liberal sample.

Conditions and soils vary so infinitely that we would be pleased to have our correspondents describe theirs.

Correspondents referring to articles which have appeared in AMERICAN GARDENING should mention page and date of issue.

We cannot promise to comply with requests to answer by mail.

*\*We cannot undertake to reply by mail.*

### Answers Requested.

A. D. M. wishes to know if there is a tool manufactured for the purpose of cutting runners from strawberry plants.

### Fertilizer for Chrysanthemums.

[Please say in AMERICAN GARDENING what is the best commercial fertilizer to use for Chrysanthemums grown in the open ground. My soil is a sandy loam, made very rich with rotted cow manure; also how much per square foot, and how often it should be applied during the season?—C. L. H., Mobile, Ala.]

—If your soil is made so rich by means of animal and straw manure, it would be unwise to use any artificial fertilizer; if you do, the chances would be in favor of the production of leaves and wood growth, with quantities of buds, but poorly developed flowers. Feed the soil liberally as you propose with cow manure, then you can, after the buds are set, water occasionally with nitrate of soda at the rate of 3 pounds of nitrate to 36 gallons of water; do this, say once a week.

### Ammonium Carbonate.

[How much carbonate of ammonia to the gallon of water? or how many gallons of water to the ounce for watering pot plants?—E. O. Nathurst.]

—The ammonia in the carbonate is so very volatile that we rarely recommend its use alone. The only way in which we use it or recommend it to be used, and then with considerable caution, is with sheep manure at the rate of one-half pound of ammonium and one-half bushel of sheep manure to 36 gallons of water. By putting the two together in a bag and placing in a barrel and filling with water, all the strength is retained, and a strong concoction the result. The barrel can be filled two or three times if allowed to stand some time.

### Double Cyclamen.

[I send you under separate cover flower of a double Cyclamen. It is so unusual to hear of such a flower that I thought it would be of interest to you. The plant is from seed sown last February, and is like any other Cyclamen except in bloom.—A. A., Newburgh, N. Y.]

—It is a very common occurrence to have Cyclamens show a tendency to become double. Usually they are abortive blooms, or in some cases it is the result of mechanical injury or excessive vigor of growth. All highly cultivated plants have sooner or later a tendency to the production of double flowers.

### Valley Pips for Forcing.

[Is there any other way by which pips of Valley can be obtained except buying them of those who have them in cold storage ready for

immediate forcing? Can they not be field-grown and removed to the forcing house in say, November, or, if needed, earlier, for ship, ment in December? Can they be grown in the field as Violets or Carnations? Kindly state how to proceed, how to cultivate and get ready for placing in forcing house for commercial purposes. How many blooms are put in a bunch? Are they tied together with white thread?—L. D. B., Ulster Co.]

—The only practical way in which you can procure your Valley pips is to buy imported stock from some of the dealers who advertise in our columns. To answer by saying it is impossible for you to grow your own pips would not be strictly true, because it is not impossible but it is impracticable. To procure serviceable single pips special knowledge is necessary, and that has to be backed up by very special and intense cultivation, and then with that it would take three years to secure strong crowns ready for forcing, and in the cold section where you are situated it is doubtful whether they would ripen properly. We know of no one north of Baltimore, Md., who undertakes to raise his own stock. Fifty sprays to a bunch is the usual number. It is immaterial what string the bunch is tied with, for to use them the florist always cuts the bunch open; but how they are bunched does make a difference in the selling of them. The better the leaves and the more graceful the arrangement of the sprays, the better the price. And all sprays should be of uniform size, so that for selling they may be graded into special, regular, or shorts.

Names of Plants.—G. B. R.—Your specimens are much too poor for identification. No. 2 appears to be a withered leaf of Bryophyllum calycinum.

Chrysanthemum Showing Pink.—E. A. C., O.—It is a natural tendency in The Queen to show a pinkish tinge, and especially has this been the case this season.

Hydrangeas.—E. A. C., O.—The plants should be in growth now, and kept steadily growing on till the time they are to flower in May. No need to force.

If the information you want is not found in these columns, just tell us what you are looking for. Our Bureau of Information will supply it.

G. M. SORREL, Manager, New Pier 35 N.R., New York.

## This Year 1897 is the GOLDEN JUBILEE ANNIVERSARY OF PETER HENDERSON & CO.

To commemorate our fiftieth business year, we have prepared the most beautiful and valuable SEED and PLANT CATALOGUE the gardening world has ever seen. Every copy costs us 25 cts. to produce, but in honor of this our "JUBILEE" year, we will send it this season FREE to any one on receipt of 10c. FREE (in stamps) to cover postage and mailing. This "JUBILEE" CATALOGUE of EVERYTHING FOR THE GARDEN is a magnificent book of 170 pages, on which are displayed over 500 beautiful illustrations of Seeds and Plants, the work of our own artists. Also six full-size colored plates which in artistic beauty have probably never been equaled, certainly never surpassed.

The gorgeous products of our Gardens and Greenhouses are not only faithfully pictured and described in the Catalogue, but equally so every other desirable requisite, new and old, for both Farm and Garden.

A "SURPRISE SOUVENIR" will also be sent without charge to all applicants for the Catalogue who will state where they saw this advertisement.

**PETER HENDERSON & CO.,**  
35 & 37 CORTLANDT ST., NEW YORK.

# AMERICAN GARDENING CLUB LIST.

LET US FILL YOUR ORDERS FOR 1897.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

## N. Y. Wholesale Market Reports.

The holiday rush is over, and a lull is the result. New Year's trade amounts to but little; Tuesday and Wednesday benefited slightly, but after that normal conditions prevailed, and following the lead of previous years this next two weeks may be expected to be very dull, and trade almost at a standstill.

Hothouse grapes, American, very poor, no price can be quoted; English, if not damaged by transit, 75c. to \$1.50 per lb.

Hothouse strawberries, New Jersey grown, more plentiful and in magnificent color (very choice) a variety known as Arch-deacon's seedling realizing \$9 per quart.

Native grapes, 11c. to 13c.

Florida Oranges, in fair supply and largely defective, very few of the lots offered show quality sufficient to reach fancy figures, \$2.50 to \$3.50 per box being the ruling prices.

Tangerine Oranges (Japan), these were in fine condition, and sold readily at \$3 per case.

California pears from storage opened up in prime condition and met with good sales. Winter Nellis, \$2.50 to \$3.50; Easter Beurre, \$2.50 to \$3.50; Anjou, \$3. to \$3.50; Beurre Gris, \$3 per case. Cases of the above varied from 200 to 150 fruits.

## Apples.

Spitzenburg, fancy, per bbl.....	\$2 00	\$2 50
Spitzenburg, common to fair, per bbl.....	1 00	1 50
Baldwin, Vt. and northern, fancy.....	1 25	1 37
Baldwin, w'n N. Y., fancy, per bbl.....	1 12	1 25
Baldwin, w'n N. Y., p'me, per d-h. bbl.....	90	1 00
Baldwin, w'n N. Y., p'me, per bbl.....	90	1 00
Greening, Vermont & Nthn fancy, pr bbl.....	1 25	1 37
Greening, west'n N. Y., fancy, per bbl.....	1 12	1 25
Greening, w'n N. Y., p'me, per d-h. bbl.....	90	1 00
Greening, up-river, per bbl.....	1 25	1 37
Common stock, per bbl.....	75	85
Lady apples, per keg.....	1 25	1 75

California strawberries have made their appearance, but so far are in poor color; they realized 40c. to 50c. per box.

Hothouse cucumbers were in short supply and condition poor; fancy made \$1.50 to \$2 per dozen; No. 2 made 75c. to \$1 per dozen.

Hothouse lettuces were about balanced in supply and demand, at from 40c. to 60c. per dozen for fancy heads. Florida lettuce arrived in bad condition, much of it badly frozen, and a good deal of the home-grown article suffered from the same cause.

Mushrooms are still in over-supply and low prices prevail, 10c. to 30c. per pound being the price; a quantity of stock goes unsold when off color and poor.

Tomatoes are in large supply, and realize only from 10c. to 25c. per pound.

Vegetables generally are arriving in poor condition, owing to the severe weather of late.

Cauliflowers are in very short supply; good to prime were worth \$2 to \$4 per barrel; extra fancy made \$5 to \$6 per barrel.

Onions are very steady and evidently a satisfactory crop just now. Prices are firm at the following figures:

Eastern white, per bbl.....	\$3 00	\$5 50
Eastern red, per bbl.....	2 50	2 75
Eastern yellow, per bbl.....	2 00	2 25
State and w'n yellow, per bbl.....	2 00	2 25
Orange Co., white, per bag.....	2 50	4 00
Orange Co., yellow, per bag.....	1 75	2 25
Orange Co., red, per bag.....	1 25	2 50

Shippers of hothouse stock are urgently advised to be more liberal with paper inside the boxes or barrels to protect from frost. The inside is more important than the outside.

Missouri River Horticultural Society held its annual meeting December 19. The Society embraces in its membership the fruit growers living in the vicinity of Kansas City, and co-operates with the State associations of Missouri and Kansas. The following officers were elected: President, Homer Reed, of Kansas City; vice-president, Ed. Taylor, of Edwardsville, Kan.; secretary, Clarence A. Chandler, Argentine; treasurer, G. F. Espenlaub, of Rosedale. The Association will hold monthly meetings during the year.

ADDRESS  
CASH WITH ORDER, AMERICAN GARDENING, P. O. Box 1897, NEW YORK.

**OUR PREMIUMS ARE OFFERED** with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will) he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

## LORD PENZANCE'S NEW HYBRID SWEET BRIARS.

Quite a New Feature in Roses.

The foliage of every one of them is as sweetly scented as the old-fashioned Sweet Briar that grew in our grandmothers' gardens.

The Sweet Briar or Eglantine, is acknowledged by all to possess one of the sweetest perfumes that nature has provided and its delicious scent is the object for which it is usually cultivated. These new varieties, now for the first time placed in commerce, are vast improvements upon the old sorts. They are hybrids (obtained by the Right Hon. Lord Penzance) between the common Sweet Briar and various old-fashioned garden Roses and are possessed of many advantages.

The flowers are borne in wondrous profusion, and vary in color from white, through several shades of pink, to very dark red or crimson.

The plants are perfectly hardy even in very bleak and exposed positions.

For vigor of growth there is scarcely anything in the rose world to equal them. Plants three years old have now many shoots on them that rise to the height of twelve feet. These, with a slightly outward bend, and clothed with flowers of exquisite tints, produce a gorgeous effect.

The buds are the most graceful, sweet and delicate objects imaginable.

The flowers are single or semi-double, and this adds lightness and elegance to their beauty.

After the flowers are over, they are followed by bright scarlet seed pods or "hips" in great numbers, which, nestling among the deep green, scented foliage, make the plant delightfully ornamental till quite late in the autumn.

No garden will be esteemed complete which does not possess a group of Hybrid Sweet Briars. They are so sweetly scented, so beautiful in color, so hardy and free from disease and the attacks of insects, as to make them eagerly sought after by all the knowing ones.

**This is Our Offer.** For one NEW subscription to American Gardening at \$1.00, we will forward you, all charges prepaid, your choice of two of the three following varieties:  
Meg Merrilies, Red.  
Anne de Geierstein, Pink.  
Brenda, Blush White.

The above to be well-established plants out of 2½ inch pots.

The collection of Three above Plants for one NEW SUBSCRIPTION to American Gardening at \$1.95.

These plants will be forwarded to our subscribers direct from the growers, eminently responsible people, who guarantee them to be true to name and color.

Plants ready for shipment May 1. Orders booked now, however, owing to the expected enormous demand.

## OUR GREATEST 1897 PREMIUM

The Wonderful New Climbing Rose

# Yellow Rambler (Aglaia)

A worthy COMPANION to the well-known Crimson Rambler.  
The Hardest Yellow Climbing Rose Ever Introduced.

**Yellow Rambler** bears its flowers in immense clusters, often as many as one hundred and fifty blossoms in a bunch, the trusses being of handsome pyramidal shape.

YELLOW RAMBLER AS A CLIMBER.

**Yellow Rambler** holds its blooms from three to four weeks without fading; a large bush in full bloom is one of the most beautiful sights imaginable.

**Yellow Rambler** is a clear decided yellow, in marked contrast to many roses so described, but which have really only a yellow tinge.

**Yellow Rambler** is very vigorous; well-established plants often making shoots eight to ten feet in height in a single season.

**Yellow Rambler** represents the triumph of the century in the hybridizing art, and is the most valuable introduction in recent years.

**Yellow Rambler** is very sweetly scented.

**Yellow Rambler** combines the climbing habit and decided yellow color with hardiness.

**Yellow Rambler** will withstand, without protection, a zero temperature; with protection it will thrive where any other rose will.

**Yellow Rambler** is thus adapted to successful culture in nearly all of the northern parts of the United States.

**Yellow Rambler** is absolutely NEW on the market and will prove the sensation of 1897!

**Yellow Rambler** premiums will be shipped direct to our subscribers from the introducers, one of the largest and most reliable firms of nurserymen in the country.

All stock is guaranteed pure and will be shipped in good condition.

**DON'T YOU WANT A YELLOW RAMBLER ROSE?**

You Can Earn One in Ten Minutes!

**READ OUR OFFER.**

We will forward, all charges prepaid, one well-established plant of **Yellow Rambler** Rose, from 2½ inch pot, for ONE NEW SUBSCRIPTION to American Gardening at \$1.00, or six plants for five NEW subscriptions at \$1.00 each.

The same plant will not be sold in 1897 for less than 50 cents. Plants will be shipped on and after March 15th. It is expected that the demand for this New Rose will be phenomenal, and we advise those of our readers who want a plant to be early with their order.

# Corn

is a vigorous feeder and responds well to liberal fertilization. On corn lands the yield increases and the soil improves if properly treated with fertilizers containing not under 7% actual

# Potash.

A trial of this plan costs but little and is sure to lead to profitable culture.

All about Potash—the results of its use by actual experiment on the best farms in the United States—is told in a little book which we publish and will gladly mail free to any farmer in America who will write for it.

GERMAN KALI WORKS,  
93 Nassau St., New York.

**DUFF LEGHORNS.**—Winners for five years. Circular free. GEORGE S. BARNES, Butte Creek, Mich.

## ALL THE LATEST NOVELTIES

AND PLANTS THAT CAN'T BE HAD ELSEWHERE.  
Cannas, Itellia and Anstria, at \$1 each.  
New Roses, New Fruits, New Shrubs, New Bulbs.  
10 Cents for \$1.—5 for 50 cts. Book on Cacti 118 pages, 120 cuts, 10 cts. Catalogues of New and Rare Plants, Cacti and Bulbs free.

A. BLANC & CO., - Philadelphia.

## NEW CREATIONS IN FLOWERS.

If you want to know about them send 10 cts. for Mrs. Theodora B. Shepherd's

New Catalogue of Rare and Beautiful Flowers.

Many New Begonias, New Cosmos, Rare Cacti, etc., not offered by others.

Ventura-by-the-Sea, - California.

## FLORA OF JAPAN & CALIFORNIA

Chinese Narcissus, over 100 varieties of Lily Bulbs, Camellias, Palms, etc. **HARDY PLANTS,** Japan Maples, Iris K., Clematis, Cacti, Flower Seeds and seeds of the most interesting and beautiful plants of California and Japan. Send for our richly illustrated Catalogue of 48 pages giving full descriptions of above.

H. N. BERGER & CO., San Francisco, Cal.  
(ESTABLISHED 1887).

## HARDY SHRUBS AND CLIMBERS.

Ghent Azaleas, Azalea Mollis, Hardy Roses, Ampelopsis Vitticola, Clematis Paniculata, RARE CONIFERS, IRIS KAMPFERII, EULALIA JAPONICA, with all hardy herbaceous plants and Grasses suitable for fall planting. # Ladies Home Companion

50 Cents a Year.

3 Months as a trial subscription 10 Cts.

This popular Ladies' Journal, now in its twenty-fourth year, is as readable and attractive as the best writers and artists can make it. In quality it is of the very best; in quantity, the most ever given for the money. During 1897 it will be the unsurpassed treat in periodical literature.

### Each Number of the Companion

Is profusely illustrated with exquisite drawings; in short it has the best writers and most beautiful pictures money can buy. It gives from 24 to 32 pages, size 11 by 16 inches, each issue, printed on fine paper and put in a handsomely illustrated cover. It is an unrivaled high-class magazine of general and home literature. Goes to over 220,000 homes regularly.

Ladies Home Companion has no equal in the excellence of its special departments devoted to Fashions, Fancy Work, Housekeeping, Floriculture, Talks with Girls, Mothers' Chat, Home Adornment, Children, etc. Articles of general interest by thoughtful and experienced writers are features of every issue. Its many short and serial stories are especially fine and appropriately illustrated.

A splendid program of great variety has been prepared for the year, including the best work of such noted authors as

Lillian Bell  
Octave Thanet  
Opie Read  
Julia Magruder

Frederick R. Barton  
Corn Stuart Wheeler

## Making an Ice House.

The whole secret of keeping ice for future use lies in the construction of a suitable place for its storage, surrounding it on all sides, top, and bottom with some dry non-conducting material, for what will keep the heat out will keep the cold in. As I have had to do with very

site should be a high and dry one, so that no water can collect and stagnate beneath the flooring of the structure; indeed, so as to insure perfect dryness at the bottom it would be well to first of all mark out on the ground the size of the building—that is to say its ground space, then removing the soil to the depth of two feet, filling in again with some good drainage, such as rock or large gravel. From the

FIG. 6.—AN ICE HOUSE.

many ice houses, I give the following details as to the construction of one that will meet all modern

requirements. Security and ease of access to the contents.

An ice house should be built entirely above ground and near to some large trees, the shade afforded by which will serve to shield it from the influence of the sun's rays. The

bottom of this pit lead a drain to some lower part of the ground, so that the water resulting from the melting of the ice and other causes may be carried off.

### Construction.

Procure some posts (sawn lumber is best) 4x6 inches across, and 10 or 11 feet long. These should be of some good lasting wood, and should be put into the ground so as to stand 8 feet above. Make a double row of posts opposite

each other, as shown on the ground plan in the accompanying illustration (fig. 6), putting the rows at intervals of about 2 feet, and the posts of each row at about 3 feet distance. Well firm the posts into the ground and line them off squarely at the top, spiking on the top of each row a plate of wood, 6x6 inches, staying these plates so as to form a double frame. New plank up the inside of each line of posts with 2 inch boards, fitting the pieces well and closely, and carrying the work up to the wall plates. The space thus formed between the boards should be well packed with tan-bark or sawdust, which will make the sides of the house both sun-proof and air-proof; matters of prime importance in preserving the ice.

Lay across the inside and upon the ground some joists, upon which put loose planks as a floor. Cover the whole with a layer of dry straw one foot in depth and the ice receptacle is ready.

#### The Roof.

For the roof use 3x4-inch joists and have them long enough to form a pitch of full 35° and also to extend over the outer wall far enough to carry the roof quite 4 feet beyond the wall plate. Short struts as shown in the illustration may also be added to better support the overhanging roof. To the rafters thus made secure, nail closely fitting boards. Make a superstructure here 6 inches in height, and board up as before to form a box roof, and pack sawdust into it.

Cut a doorway through the roof, through which to put in and take out the ice. At the top of the whole insert a piece of stove pipe to afford ventilation, covering it by erecting 4 short posts 2 feet high on which is to be fixed a pointed cap. The ice house is now complete.

#### Filling the House.

The ice to be stored should be taken from the purest water possible, as many diseases are communicated by ice from contaminated water. The blocks are best cut about 2 feet square, and while they are being thrown in, there should be a man on the floor to spread them over evenly and also with a heavy hammer to break sufficient ice to fill in all the spaces between the large blocks. The whole mass may be rendered compact by throwing water over the layers of ice. When the house is filled to the level of the wall plates put joists across, resting them on the wall plates, covering over by a floor of loose boards leaving space for a trap door, and upon this floor a layer of tan-bark or sawdust 6 inches in thickness.

#### Summary.

An ice house should be made as air tight as possible, with good dra nage, shaded by some large trees, or covered by a creeper (English Ivy where it will live), and built on a slight mound.

G. M. STRATTON.

**Value of Good Roads.**—It is computed that in some districts of Massachusetts there has been an average rise in the value of property along improved roads of over \$6 an acre. It is moreover estimated that the losses to farmers in that state hauling their product over muddy roads, as compared with the cost of hauling it over improved roads, amounts to more than enough to pay for the improvements. It will be seen, therefore, that as the profit in the hauling of produce pays for the cost of the road, the advanced value in the land is a clear gain to the land-owners. Some day perhaps the Virginia farmer will awake to the evils of bad roads.

## Why Stake Trees?

From many, the answer to this question would be, to have them grow erect. That is a good reason so far as it goes, but not the only one, nor the most vital one. This one has to do with the appearance of the tree's head; the other to which I shall allude has to do with the root. Just as the root of a tree affords a better measure than the top of the tree as regards the tree's real condition, so it is more important to have regard to the need of the root; a lesson that the average planter seems all too slow to learn.

Now when one undertakes to dig up a seedling, a tree, or a fence post, one part of the operation is to work it to and fro in various directions, in order to loosen it. By working it you in a measure pry the roots loose, and push the soil away from the larger roots, so that it does not hold so fast. That is just what the wind does to newly-set trees that are not secured to stakes, or otherwise prevented from swaying about. Let us

FIG. 7.—HOW TO STAKE A TREE.

remember, too, that at best the roots of a tree suffer impairment by transplanting, through loss of some parts that are cut off or broken in the operation. They may suffer damage likewise, from exposure to air or frost; from change of soil; from planting too shallow or too deeply and in other ways, some of which are avoidable. Is it not the part of good planting to so favor the root, already measurably injured in the transplanting, that it shall have every chance for taking hold of the soil and becoming established in the new quarters?

#### How to Brace a Tree.

In the accompanying sketch (fig. 7), which represents a newly planted tree, 10 feet in height, there is shown one of the most effective braces that can be provided for a subject of this size. It consists of three light oak or other stakes, about 5 feet in length, driven into the soil tripod-like, each 2 feet away from the tree, and with the right slant to just meet the trunk with the end, as at *a* in the engraving. Here a piece of matting is wound around the trunk to

protect it from the ends of the several stakes, which are then secured to the trunk, and to one another by means of tarred cord or by wire. Such a tree is held perfectly secure. Surely it is giving the subject the rational care which is its due in the crisis of transplanting.

To make this lesson of the tree's security the more impressive, I show a side sketch at *b* which indicates the bad predicament into which newly planted trees not rarely get. When I say that I have seen unstaked fall planted trees literally blown from the ground before spring, this present sketch need not be looked upon as fanciful. It represents, in fact, quite a common state. Not only does the injury come from a general loosening up of the roots and their displacement, but an opening is made around the trunk which will fill with water, which may cause damage in one of two ways; first water that follows readily down the root, hastens the softening process of the soil, and further aids the loosening of the roots; second, to have water stand next to the bark, which in case of a sudden freeze up is turned to ice, may work serious harm, to the bark throughout.

The advantages of this tripod method of staking trees over the single stake plan, are several; first, the tree is held more firmly in place than is possible to be done with the use of but one stake; secondly, these stakes are not driven into fresh earth, but into that just outside of the hole that was excavated and filled in during the planting process.

This method of staking is suited to trees in almost any situation. In the street, for instance, by having two of the stakes enter the soil at the curb, and these spread a little farther apart than the distance to the other stake, the tree may be brought within a foot and a half of the curb (and it should never be closer). It is at once apparent how easily the tripod may be made to serve as a tree-guard against horses and dogs by running wire, held in place by staples, horizontally from stake to stake around the tree. The first wire may be a foot above the ground to admit of the lawn mower passing underneath; above this they might be three or four inches apart.

The plan here illustrated is best suited to trees ranging from 6 to 12 feet in height. In the case of transplanting larger trees (except in the street), the same plan may be modified by substituting the use of wire for the stakes. In that event the stays may be attached higher up in the tree than when stakes are used; even among the branches, say at two-thirds the height of the tree, provision being of course made for attaching the wires both in the tree and at the ground. In the tree two iron half-bands fitted with L ends and short bolts should be made to tightly encircle the trunk at the proper height. To this completed band the wire stays are attached, extending to the ground. Here they are made fast to three stout stakes driven into the ground at equal distance apart and some feet away from the tree. Ordinary fence wire will answer very well for the purpose. If the trees are quite large the wire may be doubled.

Some one may say that the stakes, wires, and the work involve expense. This is true, but the outlay is a mere trifle as compared to the cost and value of the tree.

ELIAS A. LONG.

¶ Ill. State Hort Soc'y held its annual meeting at Springfield, Dec. 31. The following officers were elected: President, T. E. Goodrich, of Cebden; vice-president, F. D. Voris, of Neoga; secretary, H. M. Dunlap, of Savory; treasurer, Arthur Bryant, of Princeton.

## How to Grow Pansies.

Extending as our country does through so many degrees of latitude, a wide variation of rules may be made to adapt them to different localities, and as the Pansy so readily accommodates itself in many ways to the wants of its admirers, there is perhaps no flower grown from seeds which may be successfully planted at so many different seasons. It is well, then, to consider

### When to Sow Pansy Seeds.

From southern Illinois northward, if but one sowing is made, most satisfaction may be derived from planting out of doors early in spring. These plants will bloom from midsummer until snow falls, and if properly cared for, give the earliest flowers in spring, and an abundance of bloom until summer heat has drawn the branches out so long that they had better give way to younger plants.

South of the latitude above mentioned, it is better to depend on spring flowers from plants started in late summer and early fall, or from seeds planted in the greenhouse or house in January. Pansies commence to flower in from seventy to eighty days from the time of sowing, under reasonably favorable conditions.

In the latitude of northern Illinois and Wisconsin, seeds for plants to winter over should not be planted later than first of September. If plants are desired for winter blooming, sow late in July. Flowers can be had nearly as early from plants started in the greenhouse from middle of January to middle of February, but in the house it would be better not to plant earlier than March, for it is necessary to give the young plants room as they grow, planting out in shallow boxes before they become drawn and slender. If seeds are sown out of doors just before winter sets in, they will come up early in spring, and be in flower before July. If these indoor plants are too early for planting out of doors, they must be given more room as they grow, and will do better in shallow boxes holding a number of plants, than if grown in pots. In the greenhouse we plant in the benches as if they were long boxes.

### Sowing Seeds.

The same care is required in sowing Pansies as for other small seeds. They must not be covered too deeply, nor be permitted to dry after they have commenced to germinate, for a dried plant is dead no matter how small it is.

Pansy seed should be sown thinly, in shallow furrows, not more than one-sixteenth of an inch deep, made with the sharpened edge of a piece of lath. The seed bed should be mellow and rich, leveled smooth before the seeds are sown, and after sowing the seeds should be covered evenly, and the surface pressed with a piece of board. The seed bed should be watered and shaded until the young plants are up, after which they should be gradually accustomed to full light. Shade for the seed bed may be secured by laying over some kind of frame about a foot from the ground, laths or pieces of sheeting.

As soon as the plants are up, the shading must be gradually removed, as there is always danger of "damping off" with any kind of small plants in close, warm and damp situations. Too high temperature in the seed bed is fatal to Pansy seeds, and those planted in midsummer will not germinate strongly if the thermometer in the shade ranges for a long time above 75°. If seeds are permitted to dry after they have sprouted, their vitality is gone. If covered too deeply they cannot come up.

Florists are in the habit of sowing Pansies under glass, which is not necessary, at will answer very well early in spring, at shading with cloth-covered frame is far better in summer, and those who have followed our advice with their August sowing have had much better success than men using hotbed sash.

### How to Grow Pansies.

Pansies may be grown in the house or greenhouse in winter, if young plants are just commencing to flower late in the fall, and if they are not kept too hot and dry. Protection being given against green

fly and red spider. Old plants which have done service in the garden are not suitable for winter blooming. Several plants in a box are better than if grown in earthen pots. On the balcony, porch or window-sill in summer, if not directly facing the south; grown in this way, no plant better repays the care given. In the garden anywhere, if not in too hot a place directly facing the south, nor where they must struggle with larger plants and trees for nourishment.

### General Management.

The plants which have flowered in the spring will do well again in the fall if the long branches are cut back late in June.

The ability of the Pansy to stand hot weather depends greatly on its treatment. If the soil is rich enough and not too dry, nor in too hot a situation, Pansies, with frequent cultivation, will stand a long siege of hot weather, if no seeds are allowed to form. With this care, one can have Pansies from young plants in midsummer. A rich sandy loam is best for Pansies, and if not too stiff, a clay soil is better than that which is very sandy. But whatever its texture, the soil should be made rich with well-rotted manure, thoroughly incorporated with the soil, and stirred several times while the plants are in the seed bed. This thorough preparation of the soil before transplanting is very important.

Well-rotted manure, if to be had, is preferable to commercial fertilizers, and many

FIG. 8.—DISH FOR EXHIBITING FRUIT.

who think they cannot have a supply, might provide some by making a compost heap as if for a hotbed, a heap of manure covered with soil only being necessary. After heating and watering for some time, the whole mass, including the soil, should be mixed and piled again, any supply of hen manure on hand being included. In this way a good supply may be provided without the offensiveness of the ordinary manure heap. Transplant after the plants have attained the fourth or fifth leaf and before they have become drawn and slender with crowding. An eastern or northern slope is preferable. My own experience does not permit me to favor shade, although shade is preferable to too much heat, and shade of trees is more objectionable than shade of buildings. Temporary shade during the hottest portion of the day in extremely warm weather would be an advantage, but shade the whole season through will not admit the brightest colors, or an abundance of flowers.

If watering is necessary and possible, the ground should be well soaked in the evening and thoroughly stirred, about two inches deep, next morning, as soon as the soil is dry enough.

Cultivation without watering is better than watering without cultivation.

Keep the buds picked off after transplanting until the plants are well established, and also during very hot weather, for a good display of flowers in the fall.

When growing where they are to stay, about 8 inches to a foot square of space should be allowed each plant. Frequent stirring of the soil is necessary between the plants until they are too large.

A crust should never be permitted to form on the surface. Frequent cultivation is, more than anything else, the secret of success in Pansy growing.

### Winter Protection.

The plants which have flowered through the summer and fall will usually winter over well if protected with a light covering of leaves or straw which is better if a little brush has been placed over the plants first.

Young plants are quite hardy if protected from sharp winds, and not allowed to become too wet near the surface of the ground. In cold frames a considerable mixture of sand is desirable, as the plants, with protection, winter better in sandy than in clay soil. The young plants should be transplanted from the seed-bed to winter quarters early enough to become well rooted before winter sets in.

Beards may be used instead of glass for cold frame covering; glass should be shaded if too warm, as it is desirable to keep the plants dormant, and they should be watered, if necessary, as the roots will sometimes freeze dry if not looked after.

A good way to protect pansy and other plants is to have a V trough of narrow boards to cover the plants with, and then throw on some coarse litter of leaves, straw, manure or shavings. In all cases thorough surface drainage must be provided to prevent water from accumulating about the plants and forming ice about them.

### Pansy Pests.

Pansies, like many other flower plants, in hot, dry weather, are liable to be injured by the so-called "red spider," which attacks the under surface of the leaves of many garden and field plants, causing them to wither, as if from dryness. Spraying of water from a garden pump directed forcibly against the plants will reach the under side of the leaves and destroy the pest. The addition of pyrethrum powder, or else kerosene emulsion, to the water makes the remedy still more effective.

As the red spider flourishes best in a dry atmosphere, it is often the case that plants in the shade of trees suffer because heavy dews are kept from the plants. Aphids or plant lice cause more injury in gardens than people are generally aware of. A drenching of weak tobacco tea will remove them.

During close, hot, moist weather, quite large plants will "damp off," but I do not know of a remedy.

When rain comes after very dry weather, sometimes mildew will attack the plants—such as troubles Roses and many other plants. Whenever it appears, whether on Pansies or other plants, it may be destroyed by sprinkling with the following: Boil one pound of sulphur and one pound of lime in two gallons of water until it has lost two-thirds by evaporation; allow it to settle and bottle the clear liquid for use. Take one gill of this to four gallons of water and sprinkle to wet the mildew with it.—WILLIAM TOOLE, Baraboo, Wis.

## For Exhibiting Seeds and Small Fruits.

The dainty little dish illustrated (fig. 8) was recently suggested to the writer at a county fair where various varieties of peas and beans were displayed in similar little plates. They are very attractive looking and can be easily made at almost no cost at all. The diagram shows how the cardboard or very stiff paper is cut. At the dotted lines the sides are turned up, the corners overlapped and either stitched in place or held by narrow ribbons as the sketch suggests. At horticultural exhibits cherries, plums and all kinds of berries will present a very pleasing appearance in these neat little plates, and their increased attractiveness more than repays the slight outlay of time and material. W. D.

## Russian Fruits in America.

It is something more than fifty years ago—possibly sixty—when a few varieties of the apples of Russia were brought to America from England, and began to be propagated in the vicinity of Boston. They were unquestionably selected for their size, beauty, or early bearing; their cold-resisting power not being appreciated, or even discoverable, by any tests likely to occur near the Atlantic coast, in that latitude. The fact that they all proved to be summer or fall fruit was a bar to their extensive propagation; and at the time when my attention was first drawn to them, shortly after the close of the war, only their early bearing was emphasized. But exposed with other sorts to the severe winters of the Canada border, which soon destroyed every kind of tree fruit then in cultivation, these apples had a special value which could hardly be overlooked. As the same severity of climate was at that time nullifying the efforts of planters in our northwestern States, and was having a material tendency to check immigration from States where an abundant supply of tree fruits was regarded as one of the essentials of comfortable existence, a lively interest was widely manifested, and through the urgency of northwestern Congressmen, a large importation of Russian apples was made by the agricultural bureau (not then, as now, a Department), and widely distributed; but with such poor judgment that the bulk of the distribution was practically lost, the distributed cions not being utilized. Enough, however, was learned to satisfy interested parties that these trees would endure a much colder climate than any varieties hitherto tested in this country.

This knowledge became a spur to more extensive and more wisely conducted investigations and experiments; but still, as time went on, it appeared that though many of these Russian fruits were of great beauty and merit, none of them possessed the keeping quality which is so necessary, and so well represented among the older importations and their American seedlings. This necessity for more skill and knowledge in making proper selections, which was realized alike in the East and the West, and no less in Canada than in the United States, led to efforts resulting in what has been known as the Budd-Gibb expedition, consisting of Professor I. L. Budd, of the Iowa Agricultural College, and Mr. Charles Gibb, a wealthy gentleman of Canada, since deceased. These competent pomological explorers spent a whole season in studying the pomology of Russia, and brought home with them trees and cions, from Russian nurseries and orchards, which are now coming into bearing all through the "Cold North." One of the most important facts brought to our attention in the course of studying this subject is the geographical fact that nearly the whole of Russia lies north of the United States, and even of most of the populated portions of Canada. The consequence of this is that in bringing the Russian tree fruits to us, we bring them to a locality where the growing season is longer, and where apples, for instance, which are good keepers in Russia, may fail to be equally good keepers on our continent. This is now revealing itself practically, and causing some disappointments, yet it is also being shown that for our northern tier of States and for lower Canada, Russia has fruits, and especially apples which are from fair to good keepers along our northern boundary, while in size, beauty and quality they leave nothing whatever to be desired.

Messrs. Budd and Gibb did not limit their studies to apples alone. Pears, plums and cherries were also carefully studied, and not only these, but many valuable shrubs and trees, hitherto unknown to this con-

tinental, have been imported and distributed, with unquestionable advantage to the people of America. I speak in all this matter not as a mere observer, since both these gentlemen supplied me early with a bountiful collection, which has grown finely, and is proving to be of great value. Space does not allow me to refer more particularly to these matters in this article. I hope from time to time to refer to the subject with more particularity. Nearly all these large collections are now reaching a stage of growth and fruitage, which gives material for useful judgment and comment for the benefit of the horticultural public in general. I intend to do my part in this with severe impartiality. There are some antagonistic interests which seem impelled to decry and misrepresent this great work, but they must soon yield to the enlightening power of truth.

T. H. HOSKINS.

## Red Cedar Rustic Work.

No one can probably tell when or why the idea got abroad that red cedar wood is obnoxious to insects. Certain it is that this wood has long been highly recommended for making moth-proof clothes chests, and housewives have been advised to place a few red cedar chips in the boxes or whatever other form of receptacles were used for storing away rugs, furs, and similar household articles for safe keeping during the summer months, and while the cedar preventive has been proved to be of no use in thousands of instances, it is still talked about, recommended, and used by those who have much faith and little knowledge of such matters.

That the heart wood of the red cedar, and in fact, nearly all species of the genus, is exceedingly durable in both dry and moist situations is too well known to be questioned; but the sap wood soon crumbles if exposed to the weather, unless kept soaked with oil, petroleum, or some similar preventive, and when treated with these our common Red Cedar will not remain sound longer than the Oak, Chestnut or almost any other kind of hard wood. But for many years Red and White Cedar were in great demand for making rustic work of all kinds, from front yard fences down to the small rustic hanging baskets on sale at all florists in city and country villages. This use of such material was in great part due to its reputation for durability, and when peeled and soaked in some kind of wood-preservative solution it answered the purpose well; but if not so treated its durability was more imaginary than real. The old rustic fences, gates, arbors and similar structures, once so abundant in their frightful incongruity, have mostly disappeared from the suburbs of our larger cities, not only in consequence of their rapid decay, but because there has been a marked change in the ideas of suburban residents in regard to the ornamentation of their home surroundings. Rustic art as formerly exhibited in crooked sticks with strips of loose bark fluttering in the wind reminded one of old rags hung out to dry by some rag-picker, but so long as fashionable it was of course eminently acceptable.

It must not be supposed, however, that rustic arbors and similar structures, built of straight and crooked cedar roots and branches, are entirely obsolete, for they are not, although less plentiful than formerly. I am occasionally reminded of their existence by correspondents, and quite recently a neighbor, who had been to considerable trouble and expense in procuring red cedar enough to build a rustic summer house in his garden, discovered, as many others have done before, that insects were rapidly demolishing the structure, and their meal-like excrement was constantly sifting out from

under the bark and falling upon the clothes of visitors. By request I examined the building and found the sap wood literally alive with the larvae of the red cedar borer (*Hylotrupes lignus*), a small beetle of the Longhorn family (*Cerambycidae*). These beetles vary greatly in size and coloring, and are seldom more than three-fourths of an inch long and one-eighth broad; rather flat, of a brown color, with a number of black patches on their wing-covers. They rarely attack healthy, live Red Cedar trees, but as soon as the tree shows signs of dying, or it is cut down for its wood, these pests appear and often in immense numbers; the females depositing their eggs in the cracks of the bark, and the grubs hatched therefrom bore into and through the sap wood in all directions, and later penetrate the red heart wood. The best preventive is to peel the bark clean from the stems and branches as soon as the trees are cut down, and then apply a liberal dressing of petroleum or common kerosene, and spread cut the wood in the sun to dry.

A. S. FULLER.

Prof. I. L. Budd, of the Iowa Agricultural College, is identified with the introduction of Russian fruits to this country. Some of the local horticulturists do not look with favor on them, and at the late meeting of the State horticultural society resolutions were presented and adopted condemning these foreign fruits. Similar action, though more moderate in its nature, was taken last year. It is claimed that it is the universal experience of fruit growers that the Russian and other foreign varieties of fruits are unsuited to Iowa soil and climate, yet Professor Budd has for years not only constantly recommended them, but has established and developed on the college farm an extensive nursery of Russian apples and has sold the trees in large numbers throughout the State, and the members of the horticultural societies affirm this has entailed losses of hundreds of thousands of dollars to Iowa fruit growers. The Southeastern Horticultural Society also unanimously adopted a series of resolutions condemning the position taken by the experiment station.

**Horticultural Legislation Asked for.**—The Washington State Board demands that the county commissioners shall have power, upon the petition of fifteen fruit growers of the county, to appoint one or more deputy inspectors of fruit pests, and who shall have all the powers of the present State fruit inspectors to condemn and quarantine against fruit and fruit trees, etc., infested with noxious and injurious insect pests or infectious diseases, also that the powers of inspectors of fruit pests may be more clearly defined in the matter of the condemning and quarantining of infested trees and plants and fruit coming into the State. The present law gives a right of action to a fruit-grower who suffers from the fraudulent misrepresentation and practices of some nurserymen in selling fruit trees untrue to name, so that the grower who suffers loss thereby can recover. But as several years elapse, or until the trees begin to bear before the fraud is discovered, the amendment is asked that the statute of limitation should not begin to run in such case until three years after the sale of the trees is made.

**Oranges, Etc., in California.**—According to the official figures, the seven counties constituting Southern California, now have 1,472,743 trees of citrus fruit in bearing. There are also planted, but not yet in bearing, 2,676,369 trees. From those already bearing there are shipped about two million one hundred thousand boxes of fruit per annum. In three or four years, when the other trees (now planted) come into bearing, it is fair to estimate that there will be an increase of fully 4,000,000 boxes, or an output from the whole of 6,000,000 boxes per annum.

## The Fruit Garden.

**Apples.**—Study the fruit catalogues and your present list before you order the latest candidate for public favor. It is always right to keep up with the times and to try to improve on what we already have, and every live man will do so if he have the opportunity. As I looked over the grand collections of fruits at the American Institute Fair last October, I was not content with the forty odd named varieties that I already have and which ought to be enough for one private place. Nine-tenths of the trouble is that we are reaching after something new because the other man has it, and perhaps neglecting some of the old standard kinds, for this section, as Early Harvest, Red Astrachan, Sweet Bough, King, Grimes' Golden Pippin, Fameuse, Williams' Favorite, Holland Pippin, Baldwin, Alexander, Graevenstein, Pound Sweet, Newtown Pippin, Hubbardston Nonsuch, Peck's Pleasant, Ladies' Sweet, Roxbury Russet, Rhode Island Greening, Spitzenburg, Yellow Transparent, and Wealthy. None of these are new unless the last two be so classed.

**Stored Fruit.**—Look over the fruits stored away. A cellar (not under a dwelling house) with a dry, sandy bottom, and the ceiling about 9 inches above the outside surface, makes a good place for apples and pears, if the temperature can be kept between 35° and 40° without artificial heat.

**Pears.**—When stocking a new place for home use, include Bartlett, Beurre Giffard, Clapp's Favorite, Manning's Elizabeth, Beurre d'Anjou, Idaho, Petite Marguerite,

**Blackberries.**—For hardiness and productivity, Snyder stands first; that, with Kittatinny and Wilson, give a good supply.

**Dewberry.**—Order some plants of Lucretia.

**Gooseberries.**—We grow Whinam's Industry, a first-class, hairy-skin berry, and Downing, a smooth-skinned berry.

**Currants.**—Are the bushes free from scale? If not, spray them with kerosene emulsion, made by dissolving one pound whale oil soap in one gallon of water. While hot, add two gallons of kerosene, churn with a syringe or flat stick until the mixture will stick to glass like paint without the appearance of oil. To use, add one part of mixture to three parts of water. To apply it, a good brass syringe is about as handy as, or more so than, a force pump, as you can cover under and over every part as you will.

**Query.**—What about the black knot law of New York State. Is it enforced? If so, by whom on Long Island? J. HOLLOWAY.

## A Cutting Device.

The accompanying sketch (fig. 9), will afford some idea of how I proceed

FIG. 9.—DEVICE FOR OLEANDER CUTTINGS.

Seckel, Sheldon, B. Easter, Winter Nellis, Dana's Hovey, and Buffum. In these you may not have size, but will get flavor and beauty if the fruit is handled right. Our best families are now looking more for flavor than size in fruits.

**Buffum Pear** is generally considered an out of date variety, with no size nor flavor, which is very true, if the tree is allowed to carry four times the crop it ought, and the fruit left to almost ripen on the tree. But if thinned, and two or three pickings made, it will push ahead of many of the summer pears in both flavor and beauty. Moreover, the tree will thrive where many will barely grow.

**Labeling.**—Look over your fruit trees to see if any need re-labeling. If so, try zinc labels. Cut them 6 to 8 inches long, ½-inch wide on one end, and running to ¼-inch at the other. Write on them with a common lead pencil, moistened. Fasten by making a turn and a quarter around a small branch.

**Grapes.**—For black; plant Early Ohio, Moore's Early, Worden, and Concord. For red; Brighton, Lindley, Salem. For white; Moore's Diamond, Green Mountain, Niagara, and Pooklington. If limited to three varieties, my choice would be Worden, Brighton, and Moore's Diamond.

**Raspberries.**—Plant Herstine, Cuthbert, and Golden Queen. Last season small plants of Superlative made a good show of large, well-flavored berries, remarkably clean, and hanging a long time before dropping.

in the propagation of Oleanders by cuttings. I take a 3-inch flooring board, 3 feet in length, and bore into it half-inch holes as shown.

The board is then floated on water in a greenhouse with the cuttings put one into each hole, and of course, the lower end of each is immersed in the water. About six weeks ago I potted off a lot that had been rooted in this way, 85 per cent. of the cuttings striking. Any one who wishes to have a number of these shrubs will find the method described is a very rapid and easy one.

When the cuttings are well rooted pot them off into 3-inch pots, giving good drainage, for which purpose charcoal is to be preferred. Keep the plants shaded for a short time after being potted off when they will start into growth like magic. Here in the southwest the Oleanders develop into very large shrubs or even trees.—HARRY G. WOLFGANG, Tucson University, Arizona.

**Muskegon (Mich.) Hor'l Soc'y**, at its annual meeting, re-elected its officers as follows: President, J. H. Whitney, of Norton; vice-president, Orman Baxter, of Muskegon; secretary, Robert M. Pett, of Norton; treasurer, Riley Clemons, of Laketon; executive committee, Chas. E. Whitney, of Fruitport, and P. J. Martin, of Fruitland. The Society protests against hunters and sportsmen sowing wild rice in lakes and rivers, on the ground that it attracts enormous flocks of black-birds who attack the growing crops.

## The Vegetable Garden.

**Winter Vegetables.**—At this season there is nothing more appetizing than some finely grown and nicely kept celery, lettuce, or mustard and cress for salad. The latter is one of the easiest to grow, yet how rarely we find it on our tables; a little seed sown weekly in a shallow box filled with fairly rich sandy loam, kept moist and placed in any temperature from 45° to 80°, and we may have a continuous supply that will be appreciated. Lettuce is also easily to be had now by those who can command some cold frames. About the last of August we made a sowing of lettuce, transplanted it in October into the frames, and by December it was fine. By having it well aired on fine days, and carefully covered up in cold weather, it keeps admirably; we have at this date sufficient to carry us for some weeks yet.

Success in growing and keeping celery requires good judgment and care, although apparently the thing is simple enough. The past fall, being so warm, was a hard one on celery. For winter keeping it should be autumn grown, and by having it well established by September 1, it will after that date make a stocky growth. It enjoys the cool nights and thick dews of that month, and if the proper varieties are selected (and we are not to be in too great a hurry to put it in its winter quarters), it should keep admirably. In the Berkshire Hills I have kept in fine condition, Sandringham Dwarf White and London Red until the middle of the following May, in an eighteen-inch trench outside on the grounds. Celery in trenches outside must be carefully protected when the temperature is playing round the zero mark, as when covered up it quickly bleaches out, and is so tender that a very slight frost is sufficient to destroy it.

**For Spring.**—Any work that can be done now in the way of preparing for spring to have everything in readiness, is so much time gained. Procure sufficient bean poles, pea brush, etc. W. M. EDWARDS.

**The Robins.**—California horticulturists are championing the cause of the robin. At a meeting at San José, a formal resolution was adopted favoring the protection of the birds from shooters, because they devour insects.

Columbus, O., Horticultural Society had a difficulty in holding its annual meeting, owing to poor attendance; it was eventually held, however, on December 26. The election of officers resulted as follows: President, Professor W. R. Lazenby; vice-president, H. M. Sessions; secretary, Professor J. S. Hine; treasurer, George W. Sinks; members of the executive committee, Dr. O. W. Aldrich, Professor D. S. Kellicott, and J. J. Janny; chairman of the standing committees, botany, E. M. Wilcox; vegetable pathology, Professor W. A. Kellerman; fruits, Dr. Aldrich; entomology, Professor Kellicott; meteorology, Professor Lazenby; plants and flowers, W. R. Beatty; vegetables, E. C. Green.

The Tariff is agitating the minds of citrus growers, who demand a high duty to bolster up their interests against foreign competition. A resolution adopted at Ontario said the growers of citrus fruits in southern California, respectfully petition the Congress of the United States for an increase in the tariff upon oranges, lemons, limes, and grape-fruit, which may be imported into the United States from foreign countries. In the tariff on fruits which come in competition with Californian producers, an injustice has been done the growers of citrus fruits. They ask, therefore, for such an increase in the import duty as will put them on a footing of equality with the foreign grower, considering the difference in the cost of labor, and the freight they have to pay to place the fruit in the eastern markets. At Los Angeles a tariff at the rate of 40c. per cubic foot on citrus fruits was urged.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1894.

PUBLISHED BY

A. T. DELAMARE PTO. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1897.

## Publishers' Announcements.

Cheques, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**Concentration.** THE expenditure of money without adequate return is never satisfactory and is seldom continued for any length of time.

This general rule applies to the garden and to the orchard as well as to anything else. People will not continue to cultivate the soil, either for business or for pleasure, when a fair return for the money and labor expended is not forthcoming. The era of economy through which we are passing presses home with force the truth of this statement.

It is the aim of AMERICAN GARDENING to demonstrate how the garden, the orchard and the farm can be made a paying investment.

Many thousands of our landholders are "land poor;" they are paying taxes and interest on properties which are yielding little or no returns beyond the cost of planting and harvesting the crops; they go on from year to year working hard to pay off interest and taxes on large areas of land which are of no earthly use to them.

It is no longer a question as to how many acres may be cultivated, but how one acre can be worked so as to bring the largest profit, at the minimum of expense.

We believe that the land in the eastern States, especially in the vicinity of the towns (and there is but little available land now remaining that is not in

the vicinity of towns) can be used to very much better advantage, than for the old-fashioned diversified farming. In the first place, this land should furnish a satisfactory and economical home for thousands of people who would escape the noise and excitement of the city. The land in demand for such homes is perhaps too valuable for truck farming or orchards, but would well maintain the small fruit and vegetable grower who cultivates under glass as well as in the open. The profitable development of American, as of all other farming, is along the line of intensive cultivation: shorter and deeper furrows.

AMERICAN GARDENING is devoted to the work of increasing the products and profit to be derived from our native soil, and when we examine the reports of the enormous quantities of fruits, flowers and vegetables that are imported from other localities, we are convinced that there is ample field, and abundant reward for the thrifty, intelligent, progressive American Gardener.

Of the thousands of letters which we receive none are more satisfactory than those which tell us of the saving and profit which has been derived from the hints and suggestions in AMERICAN GARDENING. It is a common thing for our readers to say that a single hint acted upon was worth very many times the subscription price of the paper.

**Defence of the Commission Man.** IT is considered to be the proper thing with a certain section of growers for market to assume as a fact *a priori* that all commission men are dishonest more or less, and such communications as the following, which appeared in a recent issue of the Rural New Yorker, are not uncommon:

"Of all ways, the most hazardous and unsatisfactory method of disposing of goods is to send them to a city commission man to be sold. In this way, the goods are put into the hands of those whose chief interest is in getting their commissions, and the chances are by many odds that the returns will be much less than the goods could have been sold for at home, for it is a peculiar condition that, almost invariably, the market price is always down just the day the goods are sold, and just as surely the shipper is informed that prices will be better next week. \* \* \* Another thing; did any farmer ever send to a commission man any produce that proved of good quality, that the report was not nearly always received that the goods were of poor quality, or in bad condition? Something is always wrong. Seldom are quality and condition right."

This sort of talk is generally based on false conceptions and want of study of the market conditions. The commission man to-day is a necessity to quick distribution. The farmer or fruit grower cannot individually conduct his own sales, the time which would be occupied in the journeys is a dead loss, and the travelling expenses an unnecessary item of expenditure.

But that some premises for such words as we have quoted do exist, is true, and the cause of bad returns is to be sought very often in the grower's own want of

care at the last. The case is stated in part in this present issue, in the article on "Packing and Shipping." The subject now opened, will be followed up by detailed directions as to how to market.

**Destructive** TO the grower for profit it is a matter of importance to have an adequate acquaintance with the life histories of the more destructive insect pests affecting the crops upon which he depends for a living. Often the difference between failure and success rests upon this base, and to be able to apply a remedy with the certainty of best results the "when" is every bit as important as the "how," or "what."

In order to give our readers in as condensed and as reliable a form as possible, just the information requisite to enable them to cope with the pests, we have secured the services of Prof. W. G. Johnson, Maryland State entomologist, and inspector of nursery stock, who, during the coming year, will continue the series of practical insect talks of which the preliminary article appeared in last issue.

Any reader desiring further information regarding the subjects treated, or who may want information on any other matter relative to insects and their connection with the field, garden, or greenhouse should not hesitate to ask it of AMERICAN GARDENING.

American Gardening in 1897 will pay especial attention to those live issues which concern all growers. Its columns are thrown wide open for the intelligent discussion of unsettled vital questions, and nothing will please its publishers more than to see their offer freely used. There are improvements innumerable that can and should be made, and this is the paper in which to draw attention to them.

To the Best of Our Knowledge AMERICAN GARDENING is the only weekly published in this broad country devoted exclusively to intensive cultivation in its widest interpretation. Intensive, intense, thorough; hence, intensive cultivation signifies taking from the land all that it can be made to yield by thorough and systematic working. Under this designation are included: the market gardener, the fruit grower, the professional gardener, the vegetable grower, and all specialists, as well as the owner or occupant of a country home. All alike are interested in successful results.

Competition may be "the life of trade," but it is also death to the man who, through indolence or disregard of conditions, neglects all endeavor to keep up to the lead. And better five acres intelligently cared for than one hundred slurred over.

The Best Markets, on the whole, are these nearest home. How and where to dispose of a crop is with many a harder nut to crack than that of its successful culture. Work up your home market diligently, establish a local reputation, and the rest will follow—as a matter of course.

Co-operation is a Good Thing, but the brainy grower will not allow himself, under any circumstances, to be brought down to the level of his less intelligent co-laborer. Success is more generally the result of individual application.

## Packing and Shipping.—I.

To our minds this is a vital question, and the more we ramble in and about the various markets the more is its importance impressed upon us; and often indeed are we amazed at the quantities of good stock which is spoiled in the packing and shipping.

It is a matter of surprise to notice how many good growers there are, who do not seem to realize the first thing about the proper way of getting their goods to market, or to the consumer. It is puzzling to reconcile the one fact, that a man will lend his energies and his will to master the details of cultivation, with the other fact, that after giving it all this attention he will then practically sacrifice the whole of the result through want of even elementary knowledge in regard to packing, shipping, and market requirements. Yet such is the case with far too many growers.

Early this season the best American Beauty Roses coming into the New York market were from a gardener who had mastered the art of growing them, yet several of his shipments were a loss to him through the goods not being properly graded—i. e., all mixed up, long and short stems, anyhow. One day, when the commission man to whom they were consigned was not very busy, we watched him take and properly grade a lot, with the result that the grower himself would not have known his own goods. For some of the blooms thus assorted he took the best price obtainable in the city at that date. We advised the grower of this; he took the hint, and studied the question, with the result that to-day his average returns are nearly 50 per cent. higher than they were formerly.

We can quote another instance; a large grower of Chrysanthemums is surprised, now the season is over, that his average per bloom was only 4 cents, against his neighbor's 7 cents, knowing that he had many better blooms. We are in a position to assure him that the difference in price was entirely due to his disregard of grading, packing, and shipping to market.

It will be well to remark at this juncture, that buyers whose sole business it is to buy, and there are many such in our markets, are wide awake. It is their duty to buy as cheaply as possible, and with their training and experience they are quick to discern any discrepancies there may be and to take advantage of the same.

In looking over a lot of Roses they discover a few ringers or low grades, and they base their offer on those and not upon the better quality specimens which may be also in the box.

If a barrel of apples be opened and the buyer finds the top layer is of fine fruit, but further down sees a damaged or low grade sample, the whole barrel is discounted accordingly, and so with a box of cucumbers, or a barrel of lettuce, or what not.

It is of no use to blame the commission man, he is helpless in the matter; he does not have the time to look into these things in the bustle of the morning sales.

All too often growers fail to make themselves familiar with the requirements of the market. For instance, only last week we noticed a great loss on Pandorubium blooms through their being shipped with simply the flower stems; so short in this way they were worthless. Perhaps the grower had not the heart to cut away his plant, yet if so

done, they would have been worth 10c. to 15c. per bloom, but otherwise, except, perhaps for a very few, nothing.

Unfortunately, too, shippers cognizant of all the points alluded to, are guilty on all counts, in their anxiety to ring in their low grades among the good stock, and thus work it off; cheating the market. This is poor policy and never fails to militate against the ultimate interests of those who practice it, for they soon become known, and their stock is avoided by buyers; the salesman, even, is afraid to push the consignment until he has had time to examine it, and by which time the opportunity of a good sale may have passed. We noticed this happen with a shipment of cucumbers only last week.

Such methods are annoying and a double loss, wholesaler and grower alike suffer through this willful or woeful practice, and yet it is from this class of shippers that the constant wails of dissatisfaction come, and the complaints that other growers receive more satisfactory returns than they do.

Quality of stock averaging equal, there are always some growers who obtain better prices than others, and why? Simply because their stock is reliable, their grade marks can be trusted, the count always correct, and the stock well packed. Goods from these men sell on sight, frequently without examination, and realize the highest price. In every market there is such stock to be found, but it is never displayed, for as fast as it arrives it is placed out of sight, and held for the fancy and select trade which is sure to call for it.

Fruits, flowers, and vegetables are among the leading stocks whose value is enhanced, at first hands especially, by careful grading, wrapping, and packing. Study the methods of the men who make money on their shipments, and you will discover that just as much care, thought, attention, and energy is directed to the preparation for market as is given to the culture of the article itself.

[Our next article will contain pointers, gained from the best market practice, on how to pack and ship.—Ep.]

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Tariff Does Not Make Markets.**—Messrs. Archdeacon & Co., of Washington Market, write us that a correspondent of theirs suggests a very high tariff on canned and dried stock would be advantageous to the market grower. Commenting on this the firm says that in their opinion such would not be the case; and further report that what is needed is another class of buyers for present stock in order to work off the second rate mushrooms, etc., which are now so plentiful. There is a certain class who need only a high grade, and will pay the price for the best, but they can only use a limited quantity, and no amount of paternal legislation will make more. Messrs. Archdeacon suggest that rather than wait for business to be created by such doubtful means it would be better to open up a regular scale grading, and thus allow the commission men to handle the goods accordingly, so that second rate goods should reach second rate customers at second rate prices.

## Some Problems in Experimental Horticulture.\*

By PROF. W. M. MUNSON, Maine State College.

Agriculture is based upon certain fundamental principles, and we must all recognize the fact that the highest type of experimentation consists in enunciating these principles rather than in conducting commercial operations which may be copied—with or without success. A principle is of value whether worked out in New England or in Texas; its adaptation is, of course, a personal matter which must be settled by individual farmers.

In general, purely scientific work does not give immediate cash results, and farmers cannot afford to conduct work of this sort. It is the special business of the experiment station to conduct certain lines of investigation until some definite statements can be made. Here are gathered together men whose lives are devoted to solving the mysteries of nature, and to applying natural laws to the practical affairs of life. Here also are the necessary apparatus for carrying on the work; and the books and periodicals which enable the workers to take advantage of the results obtained by hundreds of others who are likewise engaged.

The world is full of experiments, yet comparatively few of them result in the demonstration of valuable principles. Original or scientific work cannot proceed in the manner of a well established business; methods must be worked out by experience, and many a faithful worker has wasted his life in attempting to accomplish certain ends without a knowledge of what has already been done along the same lines.

The mere cultivation of a certain number of varieties of fruits, while of value in familiarizing the grower with these varieties, is not, properly speaking, experimentation—not that I would condemn a certain amount of variety testing, for this is to a certain extent valuable—but it is not the chief work which should occupy the attention of an experiment station.

What, then, are some of the horticultural problems which present themselves for solution? First of all we may speak of

### Plant Breeding.

One of the most important lines of work which can be taken up is the amelioration of our native fruits and the production of types valuable in special localities. This work to be of the widest application must be based on general laws, and it is within the province of the experiment station to determine what those laws may be.

Through all the ages nature has been producing plants best fitted to meet the struggle for existence. She has been developing plants of the strongest constitutions and with organs best fitted for self perpetuation, regardless of other features. It remained for man to develop those organs best suited to his needs, and this he has done, regardless of the natural requirements of the species, to such an extent that some species would be utterly incapable of existence if dropped from cultivation.

The development of the great number of varieties and forms under cultivation has been the gradual outgrowth, in many cases, of centuries of care and selection on the part of man. The apple, the pear, the bean, the cabbage, wheat and some others have been under cultivation for more than

\*Read before the Vermont State Horticultural Society at Burlington, Dec. 4, 1896, and communicated by the author.

4,000 years, while most of our cultivated fruits and vegetables have been grown for from 500 to 2,000 years. Until a comparatively recent date, however, no systematic attempts at improvement have been made.

In order that improvement may be made there must first be variation in character of a given type. So one of the first subjects for investigation in the systematic study of plant breeding is that of the causes of variation. We know that plants vary as a result of difference in climate, in soil, and in culture; as a result of crossing, of grafting, and of various other conditions and operations, but in very few instances can we generalize as to probable results from any course of treatment. In general we know that plants are dwarfed and the relative productiveness is increased as we go northward. We know that there is a certain place where the relation between size and productiveness is most profitable, but with none of our most common fruits do we know where that point is. We know that differences in soil may cause such a change in a given variety that its identity is lost, but we do not know the probabilities with reference to the transmission of offspring of such changed characters. We know that in some cases we may get immediate and marked effects from the crossing of two species or varieties, but we do not know how generally such results may be expected or how important they may be. We know that in some cases the amount and the character of pollen supplied may exercise an important influence on the amount and character of the fruit, but we cannot generalize on the subject at present, and the number of species studied is very limited. We know that in some cases there seems to be undoubted mutual influence of scion and stock, but the subject has received little careful study.

Crossing and hybridizing form important features in the improvement of plants, but the production of hybrids and the study of the laws by which they are regulated is quite a different matter from raising plants for general utility. The latter is comparatively easier of manipulation and more encouraging, because of the magnificent results often obtained and the profits attendant on it. But in the investigation of true hybrids manipulation is often difficult and failures are innumerable; the labor is incessant, and unless conducted with order, watchfulness, and in a spirit of fairness and freedom from prejudice, with accurate judgment, is entirely useless—or worse than useless, as wrong conclusions will be drawn. The great variety of objects demanding attention, the length of time required for even the simplest results, the careful labeling of every plant, and registering the phenomena as they appear, the difficulty of preventing confusion among hundreds or thousands of seedlings—all of these conditions enter into the study of plant breeding, and must precede the most important part of the work, that of generalizing upon the observations made and formulating laws which shall be of real value in practical work and in future study.

#### Importance of Pedigree.

Perhaps no part of the work of a horticulturist is the subject of greater misapprehension in the minds of people generally than that of plant breeding or the improvement of cultivated plants. By the breeder of fine stock the importance of pedigree and of careful selection of individual parents has

long since ceased to be questioned, but by the average fruit grower or nurseryman little attention is paid to the development and the inherited tendencies of the plants he is growing or propagating.

Plant breeding bears the same relation to horticulture that the improvement of live stock does to animal industry. Pedigree is as valuable in the one as in the other. Care in the parentage of each successive generation is essential to the future value of the race. Pedigree is valuable only as historical evidence of such care.

Right here I wish to digress for a moment and refer to the importance of pedigree in plants. At horticultural exhibitions the inherent value of a given variety should receive quite as much consideration as is given to individual excellence. At present exhibitors go through the orchard picking a fruit here and there wherever specially fine individuals may be found without reference to the general habit of the tree, its usual productiveness or hardiness, and awards are too often made on the general appearance of collections without reference to the quality or adaptability of given varieties to the locality where grown. Again, we know that there is as marked individuality among trees as among animals, yet I venture to say not one nurseryman in 100 pays the slightest attention to this fact in propagating a given variety. As a rule scions are taken from the most available source, either from nursery rows or from any convenient tree of the variety in hand, without reference to individual characteristics. There is little doubt that this fact has more to do with the failure of orchards than any other one condition. This is one very potent factor in the "running out" of varieties. Breeds of horses, cattle or swine treated in a similar way would very soon "run out."

(To be continued.)

**Insects Injurious to Stored Grain.**—In publishing the bulletin entitled "Some Insects Injurious to Stored Grain," F. H. Chittenden, Assistant Entomologist of the Department of Agriculture, has provided a popular account of some of the pests which destroy large amounts of valuable farm products, with suggestions as to the best means of preventing their access to granaries, mills, etc., and of destroying those which have already found shelter within the grain, flour, or meal. Upward of two score of species which occur commonly in granaries are treated. The parasitic and other natural enemies of these grain destroyers are noted, and under "Methods of Control" both preventive and insecticidal measures are recommended and described. Among the first, early harvesting and threshing are recommended, and as a remedy the bisulphide of carbon treatment is stated to be the simplest, most effective, and least expensive remedy for all insects that affect stored cereals.

**Horticulture in Kansas** is decidedly slipping behind in its commercial aspects, according to the figures published in the Tenth Biennial Report of the State Board of Agriculture (1895-96), a copy of which has just been received. In 1895 the cash values of garden and of horticultural products are respectively given as \$939,000 and \$930,000, whereas in 1896 the figures show only \$760,700 and \$642,300 respectively. This decrease in value may perhaps be accounted for to some slight extent by decreasing value of the soil products, but the report shows that the areas under cultivation are largely diminished, as regards all crops excepting strawberries which show an increase of one-twelfth. In importance as regards number of trees, apples rank first, with over seven millions, and peaches are second, with about one half that number. Pears are but little grown.

## Celery for Profit.

### An Experience in Trenching Celery. The Matter of Marketing.

The latter part of October I trenched some Golden Self-Blanching Celery for my Thanksgiving trade. It has all been taken out and sold, and I think I have gained some experience that will be of use to me in the future. On opening the trenches I found that the blanching process had gone too far; that the leaves and hearts of the celery had commenced to decay! Over the trenches, so as to keep out rain and frost, I had put a roof made of two boards nailed together. This ought to have been removed during the pleasant weather and the leaves exposed to the air, which would have kept the leaves green, and the celery would have been better preserved and presented a more attractive appearance when offered in the market.

The Golden Self-Blanching is a very handsome celery when it is well grown, but it seems more subject to disease than other varieties. It needs to be grown in a very rich, moist soil, and I have succeeded better in blanching it in trenches than with boards or earth when it is grown as an early celery.

This variety is more easily blanched than the winter varieties, and I sometimes use it to follow the White Plume for the late fall trade, for it is of much better quality. Last spring I had good celery in April and May.

To preserve celery until spring it should be left out as long as the weather will permit, and after it is trenched must be left uncovered during all the warm weather so as to delay the blanching as long as possible, and when the trenches are covered for winter plenty of openings should be left for ventilation, and these filled with straw, which may be taken out if there should be much warm weather during the winter. In this way the green varieties, like the Half Dwarf and Golden Heart, may be kept until late in the spring, when most of the celery is out of the market, and it brings a good price.

It is my experience that the very early and late celery is the most profitable. I have tried storing celery for winter both in the cellar and trenches out of doors, and the latter way has proved the most satisfactory to me, for I can dig trenches and cover them at less cost than I can draw the celery to the cellar, and, moreover, it keeps better and is of better quality. On warm days in the winter I open the trenches, take out the celery, and draw it to a room heated with a stove, where it is prepared for the market.

I am near three or four large villages, and the most of it is sold from the market wagon. During the cold weather it is kept from freezing when it is being distributed by wrapping from five to 25 cents' worth in paper before it is packed in baskets, which are also lined with thick paper.

My time is usually occupied with other work in the winter, so I give a reliable man one-third of the money received for preparing and marketing the celery.

W. A. JENKINS.

Delaware County, N. Y.

**Trade News.**—The Jackson County Nursery Co., Lee Summit, Mo., has been incorporated; capital, \$5,000. Incorporators are Frank K. Graves, N. C. Cowherd, and E. H. Graves.—The California Nursery Company, of Niles, will open an agency on Market st., San José, Cal., opposite the post office. The stock of fruit trees, ornamental plants, etc., will be very large and choice.

## Rose Scale on Blackberry, Etc.

Herewith is a piece of blackberry cane which is badly infested with some kind of scale insect. Kindly inform me what species it is, and what to do to destroy it.

H. F. GILBERT.

—The piece of raspberry cane sent is badly infested by the Rose scale (*Diaspis rosæ*). It is a very common and widely distributed species, and is at times a serious pest on roses, blackberries, and raspberries. It can be kept in check by carefully pruning out the badly infested canes, and spraying or washing the suspicious ones with whale-oil soap, while the plants are dormant. There are many grades of whale or fish-oil soap on the market, and care should be taken in selecting the proper one. The soaps made with the potash lye are the most efficacious, and should not cost more than 6 cents per pound in small quantities, and not more than 3½ cents per pound in bulk by the barrel. The soap should be dissolved in hot water; two pounds to a gallon is sufficient. It should be applied with a good spray pump, but if this is not convenient, use any sort of a whisk broom or brush. Bear in mind that this is a winter or fall treatment, and should not be applied when the plants are in full foliage.

If in the spring it is found that all the culprits have not been destroyed, the plants should be thoroughly sprayed with kerosene emulsion, diluted with ten to twelve parts of water. The time of spraying should be determined for locality. The young usually appear in May, or early in June, and are easily destroyed at this time with the emulsion diluted as indicated above.

W. G. JOHNSON.

**The Free Seed Humbug.**—It is not often that beneficiaries oppose making gifts, especially when the gifts come from the Government and are paid for out of the public purse, yet if the agricultural and horticultural papers reflect the sentiments of their readers, there is very serious opposition to the present so-called free-seed distribution. Can it be that the tillers of the soil think that the principle is wrong, and that for every dollar's worth of seed they get in this way they have to pay many times over for increased taxes, etc., in other ways? Commenting on the distribution the *American Agriculturist* says: "After all said and done, there is a chance that the free seed humbug will be foisted on the country another year. The House Committee on Agriculture has inserted in the bill for appropriations for the coming fiscal year an item for the distribution of 'free' seeds. There is no popular demand for any such action, and it is to be hoped this unnecessary item of expense may be cut out." The *New York Farmer* also comments on the subject: "The House Committee on Agriculture has completed its fiscal bill for the ensuing year, appropriating about the same as last year, \$2,300,000. No appropriation for free seeds was recommended by the secretary, but the seed beggars put one in, all the same. It is a contemptible piece of business, and has nothing to recommend it."

**Arkansas Winter Fruit Crop.**—Cherries blossomed in Arkansas in October, and in November, strawberries ripened in the open air, the second crop of red June apples was half grown, and pears were in bloom.

Central Ill. Hort Soc'y met recently at Carthage, when the following officers were elected: H. Augustine, Normal, president; C. G. Winn, Griggsville, and Samuel Black, Clayton, vice-presidents; H. L. Doan, Jacksonville, secretary; J. T. Johnson, treasurer.

Anæmia means "want of blood," a deficiency in the red corpuscles of the blood. Its cause is found in want of sufficient food, dyspepsia, lack of exercise or breathing impure air. With it is a natural repugnance to all fat foods. Scott's Emulsion is an easy food to get fat from and the easiest way of taking fat. It makes the blood rich in just those elements necessary to robust health, by supplying it with red corpuscles.

For sale at 50 cents and \$1.00 by all druggists.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

## Pale Yellows in the Window.

The value of yellow coloring in lighting up the window garden is not so well known as is the same value in connection with textiles. There is really nothing that can add so much brilliancy to a general collection as a touch of yellow. Pale yellow is seldom inharmonious, and, fortunately, most of our yellow blossoms and yellows in foliage as well, are toned sufficiently from orange, so that they can be used anywhere and in any color company. Among decorative plants of yellow variegation, two good things are the old Leopard Plant, and the newer *Begonia manicata aurea*. The Leopard Plant is not fond of strong sunshine, and this makes it of especial value to those who lack sunny windows. The *Begonia* is one of the prettiest things known in the way of creamy-tinted foliage stuff, and the touch of pink sometimes delicately seen, adds the final bit of charm to the coloring.

## A Sweet Yellow Jonquil.

The so-called Great Golden Sacred Lily, which was to stand freezing and any amount of abuse, and bloom well for anyone in any window, is not giving a good account of itself in water. Bulbs of the same plant, bought of another firm under a better known name, and at a fair price are now coming into fine bloom, while the "Great Golden Sacred Lily" shows no sign of bloom as yet, and moreover, gives no promise of doing so. These earth-potted bulbs were put away about the first of October, and with cool treatment, came in just in time for Christmas. The bulbs will give several large blossoms each, and a pot of half a dozen is indeed a most beautiful and fragrant and satisfactory thing. Jonquil odorans rugulosus is the catalogue name generally given, and the bulbs are so cheap that anyone can have them.

## The Zanzibar Water Lily.

This striking plant bears the distinction of having the largest flowers of all the blue Water Lilies, as well as the deepest color. The blooms come 10 to 12 inches in diameter, the leaves twice as broad. Well-grown plants should be in bloom in 110 to 120 days from seed. The later sowings will doubtless be safer, more sure as to good results, but earlier work, if successful, will insure a longer duration of bloom. We nurse a tomato 100 to 150 days for its prosaic fruit; why not a Water Lily for its esthetic blooms? Who's for a Lily pond this season?

## The Insinuating Thoroughbred?

"How long are you intending to keep your surplus cockerels—those black ones," was asked of Mrs. Suburban one day last week. "What! the Langshans? Don't mention it, please; we couldn't eat them any more than we could—, well one of the family. They are too intelligent, too affectionate, too aristocratic, if you will." "But I thought you told me—" "Yes, I know I did; and we expected to eat them, of course. What else are surplus cockerels for? But how was I to know beforehand that thoroughbreds were so much like folks? I haven't petted them, either; they have just wormed themselves into our affections. I must try to find sale for them alive for some one's breeding yard. Really, it is the only thing I can do."

Scarcity of *Dracæna*s and *Asparagus*.

The lately-developed and developing passion for decorative plants, as against

the older preference for plants that bloom, is making some of the desirable things scarce. *Dracæna terminalis*, with its tints of rose, is one of the good old things which can hardly be propagated fast enough to supply the demand, although the price has not fallen below 50 cents. This is a plant which must have age before it has beauty, and is therefore more costly to grow to salable condition. *Asparagus plumosus* is another favorite that feels the pinch of popularity. Both these plants are such really good subjects for house culture that it seems a pity that there should be any lack of supply. If you want a *Dracæna*, you cannot buy it too soon, nor take too good care to get the genuine.

## What is a Fresh Egg?

"What do you call a 'fresh' egg?" It was an amateur poultry raiser who asked. "I mean, when you sell first-class fresh eggs what is the limit of age?" "That depends a little on the market," was the reply. "For fancy up-town grocery trade in New York City three or four days is the limit. Here, in our own town, where arbitrary distinctions between 'fancy' and 'prime,' etc., are unknown, a week, or two, or three even, in cool weather, would not injure the egg for our best grading. Our grades (perhaps you do not know) are merely 'Home-raised,' 'Farmington' (from an up-country district), and 'fresh case.' The last are the ones that have six good, three fair, and three demoralized to the dozen." "But if an egg will keep fit to use for several weeks, where do all the poor ones come from?" was the puzzled query. That is one of the mysteries many a buyer would like to fathom; one to which the poultry papers are just now giving an unusual amount of attention.

## Growing Water Lilies from Seed.

Did all notice the beautiful cut of the water garden in AMERICAN GARDENING of October 3, and read that the specimens of *Nymphaea Zanzibarensis* which bloomed from June onward were seedlings of the same season? If so, the desire to do likewise must be rampant. *N. Zanzibarensis* is classed as a tender sort, but since it requires little care, blooms the first season, and is not very expensive as to seed, it is a kind to have, or give up the name of being a flower lover. The seed is best sown early in January in pans about 2 inches deep, half filled with loam. It is scattered thinly on the surface, then covered with about an inch of water. Think of sowing seeds which do not have to be watched constantly, lest they get too wet or too dry! No; the difficulty will not be here this time, but in getting enough sunshine and heat so early. The heat is to be kept at from 70° to 80° F. Later sowing will make more sure of this, and plants may still bloom the first season, but not so early. The four-weeks seedlings will be ready to transplant into pans an inch deeper, prepared in exactly the same way as the seed-pans, except that one-half gravel is added to the loam. Transplant quickly, as the small plants will very soon. January-sown plants will be ready for the tubs in April, or for open ponds as soon as the weather is favorable in May. Since the plants are tender, it is a rather desirable plan to pot them in medium-sized pots, which may be sunk in a pond a foot or a foot and a half, and merely transferred to a tub of moist earth in safe temperatures for the winter. Popular taste runs strongly toward the rarer-colored sorts, and as *N. Zanzibarensis* has two variations at least from the type, it can be had in the typical purple-blue, in lighter blue, and in rosy pink.

MYRA V. NORRIS.

The  
Bane  
of  
Beauty.

Beauty's bane is the fading or falling of the hair. Luxuriant tresses are far more to the matron than to the maid whose casket of charms is yet unrifled by time. Beautiful women will be glad to be reminded that falling or fading hair is unknown to those who use

**Ayer's Hair Vigor.**

## Just a Crack.

Two hens with eyes swollen shut; three pullets with bronchial throats; an anxious woman; a visit to the druggist; an expenditure of money, time, and temper; all these as a resultant from one unsuspected crack near the roosts. Lucky, indeed, that several birds were not lost. Look for the cracks.

SEND \$1.80 for *The Rural New-Yorker*, and AMERICAN GARDENING, both for one year. Read *The Rural* three months. If not satisfied, say so and we will return your money for *The Rural*—all of it. It always stops when the time paid for expires.

FOR \$4 we will send *Leslie's Weekly* (formerly *Frank Leslie's Illustrated Weekly*) and AMERICAN GARDENING to any address, one year. *Leslie's* is one of the most attractive of New York's numerous illustrated weeklies, and its subscription price alone is \$4 a year; therefore, it will be seen that our offer is a very liberal one. Address your orders to AMERICAN GARDENING. Sample copies of *Leslie's* on application.

In all the States of the Missouri Valley, consisting of Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota and South Dakota, the largest circulation credited to any publication devoted to agriculture and dairying is accorded to the *Woman's Farm Journal*, a monthly, published at St. Louis, Mo., and the publishers of the American Newspaper Directory will guarantee the accuracy of the circulation rating accorded to this paper by a reward of one hundred dollars, payable to the first person who successfully secures it.—PUBLISHERS' INK, April 25th, 1896.

We have the largest and finest collection of PALMS, ORCHIDS, FERNS and FOLIAGE PLANTS for Conservatories. Hardy Herbaceous Plants, Flowering, Shade and Ornamental Trees, Vines. Everything for a private place. Estimates and Plans for Planting Places and furnishing stock (free).

## Obituary.

**William Rankin Ward**, the well known strawberry grower and horticulturist, of Lyons Farms, near Newark, N. J., died Sunday, January 3, at his home, after a painful illness. Mr. Ward was born in Lyons Farms, fifty-four years ago. He was a charter member of the New Jersey Horticultural Society, which was organized in 1875; vice-president of the State Board of Agriculture in 1886-87, and its treasurer from 1895 to the time of his death. In 1889 he succeeded Professor George H. Cooke as secretary of the New Jersey State Experiment Station, and of the State Agricultural College, holding the positions until he died. Mr. Ward had charge of the New Jersey State Horticultural exhibit at the World's Fair, Chicago, in 1892, from which time has never been well. He is survived by a wife and one son.

## A Cheap Drain Tile.

Fifteen years ago I had a piece of land wet and cold in the spring, almost a cold quicksand. No drain tile were made about here, none nearer than Detroit or Buffalo, and I had no money to send on for them. I went into a black ash swamp and cut small trees four to six inches in diameter, and cut them into convenient lengths for splitting, then split through the center and

FIG. 10.—A CHEAPLY MADE DRAIN TILE.

split the heart out, and then placed the halves together and nailed them. I laid them in the ditch, and placed sods and weeds over the joints and covered the whole. After fifteen years I dug into the ground to make connection with another ditch, and found the first in perfect order and sound. I would not recommend this for draining large fields, but for a man on a new place it will often come very convenient.

L. B. R., Michigan.

## Lawn and Flower Garden.

It must be confessed that the above title at this time of the year seems to be somewhat out of place, yet in the matter of turning over the lessons of the past season and shaping a course for the next, there is something to be done. An observant man must have seen something or other which appealed specially to him. You, reader, what did you notice? What most impressed you during last summer? Do you recall what it was? If so, write to AMERICAN GARDENING about it, so that others may learn from you. We can all learn from each other. Do not think others will not be interested in your fancy, and do not consider for a moment where the idea originated; the humblest peasant may often have the true artistic taste.

Perhaps the nicest thing I saw this last summer was a pyramid of Agaves. The stone frame was symmetrically built, and the larger plants placed at the base, and proportionately smaller ones towards the apex. This is worthy a trial.

JOHN SHORE, N. Y.

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

**Large Berries** always sell readily.

**A Small Plum orchard** in the chicken park.

**The Stored Roots.**—Be sure that the root pits are frost-proof.

**Every Strawberry Runner** clipped off means a new fruit germ formed.

**Now is a good time** to scatter fine manure evenly over the lawns.

**Roots of all Kinds** keep better in pits than in cellars.

**In Cultivating** the first two or three times with Breed's Weeder we find that it is necessary not to set the strawberry plant too shallow or it will often be pulled out.

**Small Fruit plants** should be cultivated as soon after setting as possible.

**The Successful Fruit Grower** is on the alert for any hint that will aid him. He gets his most valuable help from gardening papers.

**Seedlings.**—Select a few of the finest specimens of "dead ripe" strawberries next summer and try growing a few seedlings.

**Seldom, if ever,** have we known apples to decay as rapidly as this winter.

**Drainage.**—Have you so arranged the orchard that it will have perfect drainage?

**A Good Grindstone.**—How often the fruit grower can find use for one.

**Only by Testing for Yourself** will you find out what varieties of strawberries do best on your own soil.

**Large Strawberry Plants** I prefer for "cone setting" and medium sized ones for setting with the spade.

**Theory and Practice.**—The beginner may have many theories in regard to fruit growing, but do the theories put into practice give profitable returns? If so, why go ahead.

**Ideal Strawberry** must be a good shipper since it can be shipped to large cities and from them to smaller towns and arrive in good fresh condition.

**Study Varieties** of small fruits and plant only those which have a record of doing well on the largest variety of soils.

**Much Illness** is from the lack of fruit in the diet. If you don't believe it eat less pork and try it.

**Spread the Manure** from the wagon as you haul it out that the first rains may have a chance to wash it into the soil; do not leave it in piles.

**The Painstaking Fruit Grower** is the one who will succeed in the future. He will grow a fine grade only, and the market each year is demanding more good grades and less poor ones. One of his secrets of success is the choice horticultural papers which he keeps on file, and which he frequently reviews.

**The Farmer's Institutes** are increasing in interest each year. I look upon these institutes as one of the grandest movements to benefit the farmer, and, by the way, they always give the horticulturist a most hearty welcome to take part in their work and discussions.

**Free Seed Distribution.**—Who is being benefited by it? The congressman by making himself "solid." Why not appropriate the money for encouraging horticulturists and agriculturists in growing new varieties of real merit in their respective lines?

**Maple Trees.**—Over 20 years ago I helped to set out a quantity of Maple Trees for protecting a friend's home from wind storms and for shade. Labor, trees, and all expenses amounted to about \$5. To-day the same gentleman lives there, and it would take a good many hundred dollars to get consent to destroy them—a good investment.

CHAS. C. NASH.

**THE COUNTRY STORE HAS IT**

You can get a **SAFE** and **SURE** remedy for all the ordinary ills of life as well as a **SURE CURE** for . . . . .

**BRIGHT'S DISEASE, URINARY DISEASES, FEMALE COMPLAINTS, GENERAL DEBILITY, MALARIA**

and all diseases caused by disordered *kidneys* and *liver* at the *Country Store*. . . .

WARRANTED

**Safe Cure**

a **PURELY VEGETABLE PREPARATION** that has cured thousands and *will cure you*. Large bottle or new style smaller bottle at your nearest store.

**POULTRY BREEDERS!** Send 50 cts. for a 20-page monthly devoted to Poultry, etc. Sample 6 cts. **MICHIGAN POULTRY BREEDER**, Battle Creek, Mich.

## HARDY SHRUBS AND CLIMBERS.

Ghent Azaleas, Azalea Mollis, Hardy Roses, Ampelopsis, Vitis, Clematis, Panicle, RANUNCULUS, IRIS KAMPFERRI, EULALIA JAPONICA, with all hardy herbaceous plants and Grasses suitable for fall planting. Catalogues on application. High-class Plants for the conservatory, greenhouse, lawn and grounds of country places a specialty.

F. R. PIERSON CO., Tarrytown-on-Hudson, N. Y.

## EXTRAORDINARY OFFER!

### The Youth's Companion

to 1898, including the Christmas, New Year's and Easter Double Numbers for two years, the Twelve-Color Companion Calendar for 1897 (the most costly gift of its kind THE COMPANION has ever offered), and

### American Gardening,

Both papers to Jan. 1, 1898, for only \$2.00 in advance.

**Above offer is for new subscriptions only to both papers.**

**SURE CROP!****MUSHROOM SPAWN**

LILUM HARRISHI. DUTCH BULBS.

Illustrated Bulb Catalogues on application.

**WEBER & DON,** Seed Merchants and Growers,  
114 Chambers St., New York City.**Business Cards.**

Cards will be inserted under this heading at two CENTS PER WORD each insertion, payable in advance; the address to be counted part of the advertisement.

**LAND DEVELOPMENT,** consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 1697, New York City

**Situations Wanted.**

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

**GARDENER** and florist, life experience in all branches, wishes position on private place; intelligent and trustworthy. First-class references; married, age 38. Box 73, Au Sable Forks, N. Y.

**FOR SALE.**

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance. The address will be charged as part of the advt. and each initial, or a number, counts as one word. No cuts or display type allowed.

**BULBOSCH BROS.,** bulbs and plants, Englewood, N. J.

**STRAWBERRY PLANTS** for sale. Catalogue free. Charles Howard, 3 Johns, Md.

**RADISH and LETTUCE** Seed for forcing. Write for Samples and Prices. Frank H. Battles, Seedsman, Rochester, N. Y.

**DO YOU WANT** the best flower pots? If so, send address to The Whilldin Pottery Co., 715 Wharton St., Philadelphia. Three shipping points, can save you freight.

**STRAWBERRIES,** Potatoes, Seeds. Send to the Rocky Comfort Gardens for the brightest little catalogue published, with up-to-date prices. Wm. A. Olds, Okemos, Mich.

**STRAWBERRY PLANTS,** Clyde, best early perfect flowering variety ever introduced. Sixty varieties, best plants at lowest prices. Catalogue free. Enos W. Dunham, Stevensville, Mich.

**GLADIOLI, CANNAS, OLIVIAS,** Bouchet and Lemoine's novelties first offered in America. Special tested selections at European prices. Extra mixtures: Ingleside Hybrids, Dr. Van Fleet's choice collection, Burbank's California Select, Mt. Vernon Hybrids, Groff's Hybridized Seed and Seedlings, Cannas, Italia, Austria, and best standards. New Hybrid Olivias. Canna Seed. H. H. Groff, Simcoe, Ontario, Canada.

**PAPERS, MAGAZINES, ETC.**—We will make you liberal concessions when you order other periodicals for the year, whether in connection with your own subscription or not. Send us your list for estimate American Gardening, P. O. Box 1697, New York.

**WE HAVE BACK VOLUMES** American Gardening for sale: of some years we have a good supply, others are short; bound and unbound. Will be pleased to quote prices on any year desired. American Gardening, P. O. Box 1697, New York.

**HOME GROUNDS, HOW TO LAY OUT.**—The most perfect plan ever given the public, by which to lay out an estate of one to ten acres or more. We give the cardinal principles which govern the art so clearly that all may easily understand. Heavy paper, safely packed, postpaid, for 25 cents. It will pay you to study this plan. American Gardening, P. O. Box 1697, New York.

## Colorado Springs, Col.

### HANDSOME GREENHOUSE FOR SALE.

Situated in the center of the city of Colorado Springs, where the climate is adapted to the growing of all species of flowers. Land 100 by 150, with 12,000 square feet of glass: steam-heat, electric light, first-class boiler and machinery, thoroughly equipped and in running order. The most complete establishment of the kind west of the Mississippi River.

Price, \$30,000.

Address Messrs. **VAENUM and HARRISON,** Counselors-at-law,  
62 William Street, New York City.

**PRIVATE GARDENERS.**

Dutchess Co., N. Y., Horticultural Society Banquet, which was previously announced for January 6, has been postponed until further notice.

W. Plumb has been appointed superintendent of the gardens, grounds, etc., of C. P. Huntington, at Throggs Neck, N. Y. Mr. Plumb commenced his duties January 1.

Generally speaking, the flower shows of the past season have not been marked successes financially, so far as we can learn. Is the public nauseated or what?

**The Gardener's Position.**

No one can make any mistake by doing his best to encourage the culinary use of all vegetables, by supplying a good selection of them well grown successively through the season. We are far behind the older countries in the epicurean art. We are nevertheless growing and improving in this as well as in all other arts; and our cosmopolitan nature, the progressive instinct and the intercommunion our people enjoy with the rest of the world lead us to the belief that sooner or later the inevitable outcome will be that we shall excel in all the fine arts, and lead the rest of the world.

Many a gardener is put to many inconveniences from a lack of conveniences and of the needed requisites to carry on his work successfully, arising from the want of a horticultural interest in his employer, who, being so engrossed in business affairs, gives but little attention to the home establishment. Our future prospects in this respect also are improving, and the gardener of the future will be better understood and appreciated. Many wealthy owners of country estates, particularly these of Newport and Lenox, are yearly devoting more attention to them, and educating themselves in their needs and requirements. This will prove of mutual benefit; so let this give us the impulse to excel in all our undertakings.—W. M. EDWARDS,

**Violet Princesse de Galles.**

It may be a matter of fancy as to whether the single or double varieties of violets be favorites for the nonce, but there is no gaining that the recent advent of fine singles has made a decided tendency to regard them more highly. For our own part we are glad of the change, and like some of each.

Gardeners should grow such a beautiful variety as Princesse de Galles; it is very long stemmed, highly fragrant, and of a clear, bright, true violet color. A bunch of these flowers was recently presented to us; each bloom measuring, without spreading, one and a half inches across. This variety is an excellent one for frames, demanding plenty of ventilation.

**New York.**

New York Gardeners' Society meets on Monday, January 11, at 6 P. M., when W. Scott will open a discussion on grape growing under glass. On the same day the American Gardeners' Society meets at Mott Memorial Hall, Madison ave., New York City, at 1:30 P. M., to receive report of the provisional committee, and all are invited to attend. The gardeners will be entertained in the evening by the New York Florists' Club, to a "smoker" for which some good talent has been engaged. The American Institute Farmers' Club meets on Tuesday at the rooms, 111 W. Thirty-eighth st., New York.

**Assignment.**—On December 28, Vice Chancellor Pitney, in Jersey City, N. J., appointed John Young, of that city, receiver for the business of Thomas W. Weathered's Sons, greenhouse builders, etc. It is stated that liabilities amount to \$47,000, with assets at nearly \$60,000.

**Questions Answered.**

This is a Bureau of Information, to which subscribers can apply freely for advice on any and all subjects in the field of horticulture.

In order to lessen labor, and that the Editor and his friends may understand each other, the following rules must be observed:

**Rules for Correspondents.**

Questions must be concise, plainly written on one side of the paper only and addressed INQUIRY DEPARTMENT, AMERICAN GARDENING, P. O. Box 1697, New York City.

Letters appertaining to subscriptions, or other business matters, should be directed separately; otherwise delay may follow.

The name and address of the sender is required, in addition to a nom de plume. Use a separate sheet of paper, not a scrap, for each question. Questions will be attended to without delay. If by mistake a query fails to be answered, it should be repeated.

Specimens of plants for identification must be ample; mere scraps will not do, and no notice can be taken of such.

Questions relating to insects or diseased plants should always be accompanied by specimens, packed in a tin box, and forwarded at letter postage. Always send a liberal sample.

Conditions and soils vary so infinitely that we would be pleased to have our correspondents describe theirs.

Correspondents referring to articles which have appeared in AMERICAN GARDENING should mention page and date of issue.

We cannot promise to comply with requests to answer by mail.

\*. We cannot undertake to reply by mail.

**Black Fly on Chrysanthemum.**

(To J. V. Wallace.)—The insect sent has been given the name of Siphonophora chrysanthemi by American writers, but it is a question whether this species is not the same as one that has been described in Europe as Siphonophora artemisiae. It is known among forcing-house men as the "Black" or "Brown" Fly, and rarely attacks any plants under glass other than the Chrysanthemum. It will, however, sometimes attack Feverfew and similarly related plants. The remedy which forcing-house men use almost universally and find most practical is fumigating with tobacco. The fumigation is commenced as soon as the plants are started in the greenhouse, and continued weekly until the flower buds begin to open. After the flowers begin to open the beds and walks are mulched with tobacco stems. I have failed to see any practical results from the latter treatment. A few growers use tobacco dust on the plants because it is less dangerous to the plants than fumigation, but they never get entirely rid of the pest by that means; other use Rose-leaf insecticide, Antipest, and numerous other patented remedies. All are expensive when applied thoroughly enough to give good results. The consequence is, the use of them results in failure more often than in success. Frequent spraying of the plants with properly made kerosene emulsion will rid a Chrysanthemum house of the pest, but it requires more skill to make this correctly for use under glass than to use tobacco fumes. During the past fall I have had excellent success in the use of hydrocyanic acid gas in Chrysanthemum houses. This did not require over twenty minutes work after the men had left the houses. The houses were left closed until morning. Not a single living Brown Fly was to be found in the house after the treatment, although the plants were only half grown when treated. One fumigation with this gas was all that was needed. At present the use of hydrocyanic acid gas is an unshared remedy to recommend, as the chemicals used in the manufacture of it vary to such an extent, in per cent. of purity. A formula giving a certain amount of ingredients to be used in a given number of cubic feet of space might work to perfection, while a second lot of the material, purchased from the same druggist, might be of double or treble the per cent. of purity of the first, and when used kill every plant in the house.—F. A. SERRINE. [We would emphatically caution against the use of so virulent a poison by those unskilled in the handling of such dangerous substances.—ED.]

**Raising Holly from Seed.**

[Can you or your readers give me any information in regard to raising the Holly from seeds.—D. H. B., Spring Hill, Kansas.]

—When the berries are collected in sufficient quantity, dig a hole in the ground, say 3 feet in depth, throw in the berries, then stamp upon them or do something to bruise slightly, at the same time sprinkle some light soil or

and in with them. When all are in the heels cover up with leaves or litter of any kind to prevent frost or rain from getting at them. In early spring the seed will be ready to sow. Prepare a bed in some out of the way corner where it will not be disturbed for a year or so. Make a preparation of light soil, consisting mainly, if possible, of leaf mold and sand; tread it firm, smooth the surface, and sow the seeds thickly either in rows or broadcast. Cover lightly with soil of the same nature, and either run a roller over it or make firm by beating with the back of a spade in order to have the seeds firmly encased. The seed germinate irregularly, a few plants will appear very quickly and will be ready to move into nursery rows the first season others will keep coming up from time to time, even for two years after sowing.

#### Manettia Vine.

[What is the matter with my Manettia Vine? I bought it last spring, it was then in bloom and all the catalogues say it blooms constantly, but mine has not blossomed. It has grown and covered a trellis a foot high. I have two plants, one seems to be dying off, and I have set it away to rest, only giving sufficient water to keep from drying out; the other is still growing and putting up fresh shoots from the root, but if the surface gets dry, as it does sometimes in one night, the leaves turn black and are as crisp as if burned, the next morning. Does it require much or little water, and sun or shade; also what temperature is best suited for it?—*Manettia*.]

—These evergreen climbers like a warm, sunny position, and in the summer will stand a high temperature; during the winter from 45° to 55° is sufficient. There must be something the matter at the roots. Is the drainage right, or is it in the way of hot pipes or draughts?

#### Cropping Poor Land.

[I have a few acres of land which is very poor. I had it plowed this fall with a view of seeding it down next September. I would like to know what crop, one that would not require much care, would be best to plant on it in the spring. I was thinking of sowing some rye just for the straw, which I would use for bedding. Could I get much of a crop from spring sown rye? Would it be better for me to lightly manure the land in spring and then give a heavy dressing at the time of laying it down to grass in September?—*S. B. C.*]

—If you sow rye be sure that you sow spring rye, otherwise it will be of no use. Why not sow the grass at the same time? Or put on some other crop, potatoes, for instance would do. Then when this crop is cleared away cultivate and manure again, next sowing winter rye, and at the same time lay down to grass; the rye will serve as a protection to the grass.

#### Chrysanthemum Cuttings.

[Will you please answer the following question in your paper: I am going to raise some Chrysanthemums. Will it be best to take cuttings and root them, or take from the old plants shoots with roots on them?—*A. Ashton*.]

—The tops of young growths are the best; that is, if large blooms are desired, but if size of plant and quantity of bloom be wanted, a nice young sucker, slightly rooted, will give good results.

#### Mushrooms Out of Doors.

[Will you please give me the proper instructions for planting mushrooms near a cottage on the coast of Maine during the summer months? They grow wild abundantly near by. —*Mrs. J. V. Menick*.]

—If you have any grass land near the house give it a good dressing of common salt this coming spring, and at the same time, or at least a few days after, insert at intervals some spawn of the ordinary mushroom (*Agaricus campestris*). This you can procure from our advertisers. Break the bricks into pieces at two inches in diameter, open the ground with an iron bar or any tool of the kind, drop in a piece of spawn so that it will have an inch of covering, and make firm with your foot. If there should be no grass or meadow land available, but only shrubbery or wood, or a rubbish heap in some out of the way corner, try *Agaricus subrufescens*, the summer mushroom. For particulars of this see page 524 in issue of August 15, last year.

#### Grafting Oranges.

[What is the best way to graft an orange on a lemon? The lemon tree is about fourteen years old and does not bear fruit, but the orange is just on the point of blossoming, and the oranges also. I want to take, if possible, a shoot from the orange tree and graft it onto

the lemon. The lemon tree is about four feet high. What is the best time of year to do it?—*James Leakes*.]

—Possibly the present time is the most suitable. The best plan will be to bud as many shoots or branches of the lemon tree as you may wish to remain. Select a part of the branch on which to bud, where the wood is only partially ripened, and on which the bark will lift readily and cleanly in order to allow the insertion of the eye which you will take from the orange. In selecting the bud, try to secure a plump growth in about the same stage as the wood you are working on; make a clean cut into the wood. Securing a leaf with the eye, and having the bark on each side of it undisturbed, or rather cut clean and not jagged on the edges, have only enough of wood or pulp inside to keep the bud firm, which means a very small particle. Insert well under the bark and bring the edges back again over the inserted bud, making all firm with bast, woollen thread, or any soft tying material. Keep the place moistened from time to time, and if necessary, shade from strong sunshine until the buds have "taken." When growth begins from the bud, shorten back the lemon tree nearly to the buds in order to throw the strength into the orange.

#### Live-for-Ever.

[I have a field that is covered with Live-for-Ever, is there any way to get rid of it?—*D. W., Johnston, N. Y.*]

—The term Live-for-Ever is so indefinite that an answer is impossible. There are several subjects that bear the cognomen, but usually it means some of the Sedums. But surely that is not what is troubling you. Send a specimen.

#### Kaffir Corn.

(To Denison, Texas). Kaffir corn is a variety of Sorghum, cultivated for both forage and grain, and is peculiarly valuable to southern sections. The culture of the same is exactly the same as that of field corn. A bulletin on the subject was recently issued by the Department of Agriculture.

Names of Plants.—*C. M. C.* It is impossible to determine a plant from a single leaf. The one you send may be from a *Pittosporum*, but we cannot say more without having ample material for examination.

At this writing our advertisement has appeared but once in *American Gardening*, but already we have received sixteen (16) known inquiries. We consider this very good, coming so early in the season. **BATEMAN MFG. CO.**  
New Jersey.

**GOOSEBERRY AND CURRANT—50,000.** Other Nursery Stock.  
T. G. ASHMEAD, Nursery, Williamston, N. Y.

### The American Kitchen Magazine

A magazine for every up-to-date house-keeper. The suggestions contained in a single number are worth more than a year's subscription. Price, \$1.00 a year. Sample copies free. **SPECIAL.**—We will send *AMERICAN GARDENING* and *AMERICAN KITCHEN MAGAZINE*, both one year, to any address, for \$1.50.

**AMERICAN GARDENING, P. O. Box 1697, N. Y.**

### The Only Coiled Spring Fence.

It has taken us ten years to convince the public that elasticity is absolutely necessary in an efficient and durable wire fence. It was the Coiled Spring that did it. We own the original patent on this device. "A word to the wise is sufficient."

**PAGE WOVEN WIRE FENCE CO., Adrian Mich.**

## AMERICAN GARDENING AND THE OHIO FARMER,

Both One Year Each for only \$1.60.

**THE OHIO FARMER** is a large, 30 page weekly, \$1 per year. A National Farm, Stock and Home Journal, and is clearly the Leader of the Agricultural Press of America. It pays more for illustrations, Correspondence and Market Reports than any other of its class. It is the Best and Cheapest no more than others. Send for a **SAMPLE COPY** TO **THE OHIO FARMER, Cleveland, O.**

**THE OHIO FARMER** will start their paper the date the order is received by them, and continue to Jan. 1898—14 months, if ordered at once. Address all orders to

**AMERICAN GARDENING, P. O. Box 1697, New York**

# AMERICAN GARDENING CLUB LIST.

LET US FILL YOUR ORDERS FOR 1897.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

ADDRESS  
CASH WITH ORDER,

AMERICAN GARDENING, P. O. Box 1897, NEW YORK.

## N. Y. Wholesale Market Reports.

Business generally is very slow. The weather having moderated so much has caused much of the stock to reach the market in better condition, especially southern stock. There not being frost enough to affect transhipment locally grown produce suffers in price accordingly.

Hothouse grapes (English) 75c. to \$1.25 per lb. when in good condition; demand slow.

Native grapes, 11c. to 13c. per lb.

Hothouse strawberries, plentiful; color and quality fully up to the high average noted last week, but price reduced by one half. They now realize \$4.50 per quart.

Florida berries are now arriving, but so far the quality is poor.

Florida oranges are still in poor condition and much of the stock fails to realize full market figures. Grape fruit is doing well, fancy selling as high as \$8 per box (36 to 54 fruits). The possible supply, according to reliable reports will be very limited and prices may be expected to remain firm.

California pears from storage are in prime condition, sales slow. Winter Nellis, \$2.50 to \$3.50; Easter Beurre, \$2.50 to \$3.50; Anjou, \$3 to \$3.50; Beurre Gris, \$3 per case. Cases of the above contain from 100 to 150 fruits.

Apples remain as quoted last week. Fancy stock moved slightly better during the week. Hothouse cucumbers are still in light supply and prices firm; fancy, \$1.50 to \$1.75 per dozen; No. 2, 50c. to 75c. per dozen.

Hothouse lettuce moves slowly, sales having been checked by the excellent condition of late arrivals of Florida stock. For fancy stock, good heads, prices rule from 40c. to 50c. per dozen; lower grades vary from \$1 per barrel upwards. Florida, 75c. to \$1.50 per basket.

Mushrooms still in over-supply; prices range from 15c. to 40c. per lb.

Tomatoes are poor in color and size; the supply is not heavy, but the quality is so poor that prices keep down, 25c. and 30c. being the best figures obtainable, and much of the stock sells lower still. Florida, per carrier, \$1 to \$2.

Hothouse radishes are very plentiful; the average price for good stock is \$3 per 100 bunches, with an average of eight in a bunch.

Other vegetables: Celery is in fair supply and very quiet, prices favoring the buyer. Cauliflower nominally unchanged in absence of fresh receipts. Cabbages and other local winter vegetables generally unchanged. Norfolk steamer brought 1200 barrels of spinach and 600 barrels of kale; trade is slow and prices show no improvement. A fair supply of Florida vegetables in by freight and express. Most of the string beans are offering at \$1 to \$1.25, being too old or otherwise inferior; a few lots brought \$1.50, and one or two strictly fancy marks of White Refugee were placed at a considerable premium. Egg plants would sell well if fancy; offerings generally defective and hard to move.

Beets, Florida, new, per crate.....	\$0 50	\$1 00
—Charleston, new, per doz. bchs.....	40	60
Brussels sprouts, per qt.....	1 00	1 10
Cucumbers, Florida, per crate.....	2 00	4 00
Cabbages, per 100.....	3 00	4 50
Cauliflowers, extra fancy, per bbl.....	5 00	7 00
—fair to prime, per bbl.....	2 00	4 00
Celery, flat bunches, per doz. bchs.....	50	1 00
—fancy large, per doz. stalks.....	40	50
—average best, per doz. stalks.....	20	35
—small to medium, per doz. stalks.....	10	15
Egg plants, Fla., per 1/2-bbl. box.....	75	1 50
—Florida, per bbl.....	1 00	2 00
Kale, Norfolk, per bbl.....	40	60

Onions are still improving in price, making quite an advance from last week. Keeping quality poor:

Eastern, white, per bbl.....	\$4 00	\$6 00
Eastern, red, per bbl.....	3 00	3 25
Eastern, yellow, per bbl.....	2 75	3 00
State & W'n, yellow, per bbl.....	2 25	2 60
Western, white, choice, per bbl.....	4 50	5 20
Orange Co., white, per bag.....	2 50	4 00
Orange Co., yellow, per bag.....	2 25	3 50
Orange Co., red, per bag.....	2 25	3 75
Bermuda, per crate.....	1 75	2 00

**OUR PREMIUMS ARE OFFERED** with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will) he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

## LORD PENZANCE'S NEW HYBRID SWEET BRIARS.

Quite a New Feature in Roses.

The foliage of every one of them is as sweetly scented as the old-fashioned Sweet Briar that grew in our grandmothers' gardens.

The Sweet Briar or Eglantine, is acknowledged by all to possess one of the sweetest perfumes that nature has provided and its delicious scent is the object for which it is usually cultivated. These new varieties, now for the first time placed in commerce, are vast improvements upon the old sorts. They are hybrids (obtained by the Right Hon. Lord Penzance) between the common Sweet Briar and various old-fashioned garden Roses and are possessed of many advantages.

The flowers are borne in wondrous profusion, and vary in color from white, through several shades of pink, to very dark red or crimson.

The plants are perfectly hardy even in very bleak and exposed positions.

For vigor of growth there is scarcely anything in the rose world to equal them. Plants three years old have now many shoots on them that rise to the height of twelve feet. These, with a slightly outward bend, and clothed with flowers of exquisite tints, produce a gorgeous effect.

The buds are the most graceful, sweet and delicate objects imaginable.

The flowers are single or semi-double, and this adds lightness and elegance to their beauty.

After the flowers are over, they are followed by bright scarlet seed pods or "hips" in great numbers, which, nestling among the deep green, scented foliage, make the plant delightfully ornamental till quite late in the autumn.

No garden will be esteemed complete which does not possess a group of Hybrid Sweet Briars. They are so sweetly scented, so beautiful in color, so hardy and free from disease and the attacks of insects, as to make them eagerly sought after by all the knowing ones.

**This is Our Offer.** For one NEW subscription to American Gardening at \$1.00, we will forward you, all charges prepaid, your choice of two of the three following varieties: Meg Merrilies, Red. Anne de Geierstein, Pink. Brenda, Blush White.

The above to be well-established plants out of 2½ inch pots.

The collection of Three above Plants for one NEW SUBSCRIPTION to American Gardening at \$1.25.

These plants will be forwarded to our subscribers direct from the growers, eminently responsible people, who guarantee them to be true to name and color.

Plants ready for shipment May 1. Orders looked now, however, owing to the expected enormous demand.

## OUR GREATEST 1897 PREMIUM

The Wonderful New Climbing Rose

# Yellow Rambler (Aglaia)

A worthy COMPANION to the well-known Crimson Rambler.  
The Hardest Yellow Climbing Rose Ever Introduced.

**Yellow Rambler** bears its flowers in immense clusters, often as many as one hundred and fifty blossoms in a bunch, the trusses being of handsome pyramidal shape.

A CLUSTER OF YELLOW RAMBLER ROSES.

**Yellow Rambler** holds its blooms from three to four weeks without fading; a large bush in full bloom is one of the most beautiful sights imaginable.

**Yellow Rambler** is a clear decided yellow, in marked contrast to many roses so described, but which have really only a yellow tinge.

**Yellow Rambler** is very vigorous; well-established plants often making shoots eight to ten feet in height in a single season.

**Yellow Rambler** represents the triumph of the century in the hybridizing art, and is the most valuable introduction in recent years.

**Yellow Rambler** is very sweetly scented.

**Yellow Rambler** combines the climbing habit and decided yellow color with hardiness.

**Yellow Rambler** will withstand, without protection, a zero temperature; with protection it will thrive where any other rose will.

**Yellow Rambler** is thus adapted to successful culture in nearly all of the northern parts of the United States.

**Yellow Rambler is absolutely NEW on the market and will prove the sensation of 1897!**

**Yellow Rambler** premiums will be shipped direct to our subscribers from the introducers, one of the largest and most reliable firms of nurserymen in the country.

**All stock** is guaranteed pure and will be shipped in good condition.

**DON'T YOU WANT A YELLOW RAMBLER ROSE?**

You Can Earn One in Ten Minutes!

**READ OUR OFFER.** We will forward, all charges prepaid, one well-established plant of Yellow Rambler Rose, from 2½ inch pot, for ONE NEW SUBSCRIPTION to American Gardening at \$1.00, or six plants for five NEW subscriptions at \$1.00 each.

The same plant will not be sold in 1897 for less than 50 cents. Plants will be shipped on and after March 15th. It is expected that the demand for this New Rose will be phenomenal, and we advise those of our readers who want a plant to be early with their order.

## An Old-fashioned Border.

We hear a great deal of talk and read a great deal of writing upon the merits of the "Old-fashioned Border," as against the stilted, laborious, and unnatural effects of the more often seen carpet bedding. For our own part, we revel in the naturalness, the freedom, and the luxuriance of growth, as seen in the so-called "old-fashioned" style, where is seen the art that does reflect, nay, is nature.

It is pleasurable to be able to present herewith, in figure 11, a representative of such a charming garden; that of Mr. Samuel Henshaw, on Staten Island, N. Y., and it is hoped that the view may serve as an aid to others who desire to have a garden which shall be a "thing of beauty" and "a joy forever." But let the owner speak for himself:

"The illustration (fig. 11) shows part of the 'Grandmother's Garden,' or old time herbaceous border, a style of gardening so much in vogue fifty or sixty years ago. The border altogether is about 175 feet in length, with an average width of 13 feet, and three-fourths of the occupants

are entirely hardy, requiring no protection whatever; the rest of the plants are what may be termed transient visitors, such as Cannas and Dahlias, a few of the most reliable annuals, and some native plants commonly known as weeds; in fact, one of the most beautiful objects during the past summer was a plant of *Cassia Marylandica*, this is a common swamp plant, usually found growing about four feet high. In this border it covered a space six feet in diameter, and had a height of seven feet, and was laden with its golden pea-shaped blossoms for two months. Other native plants

responded to cultivation by extra size, and profusion of bloom not seen when growing wild, among these may be mentioned the *Rudbeckia*, *Coreopsis laciniata*, *Veronica*, *Vinca*, *Leucanthemum*, *Asters* and *Solidagos*. There are several annuals which come up every spring, and require to be treated as weeds—just thinning out to leave only such as are needed.

"The plants most prominently seen in the border are the Day Lily, Cannas, Dahlias and Hardy Grasses; *Eulalia japonica* is the best of these, and gives the least trouble. *Erianthus Ravennæ* or Pampas Grass, grows taller, but is not as picturesque. The two varieties of old-fashioned Ribbon Grass, or 'Gardener's Garters,' are both worthy a place, the old one makes the brightest show in early summer, but the other retains its variegation all through the hot weather, and even after the first frosts is cheerful.

"For reliability and constancy of bloom nothing can beat the *Pæony*; Perennial *Phloxes*, in different colors; the Siberian and Iceland *Poppies*; *Funkias*, *Hollyhocks*, *Foxgloves*, *Dianthus*, and other old-time oc-

cupants of the garden; any gaps that occur during the summer can always be filled up with such annuals as *Zinnias*, French or African *Marigolds*, *Alyssum*, *Mignonette*, *Portulaca*, *Asters*, and many others that may be taken from a reserve sown in the cold frame in spring."

"Hardy *Roses*, not forgetting the Moss Rose and Sweet-brier, are planted at intervals of 12 feet, the whole length of the border, and are always acceptable."

"The illustration (fig. 13) of one wing of the extension of my house draped with climbers shows a treatment that is

FIG. 11.—A TYPICAL "OLD-FASHIONED" BORDER.

all in keeping, with such plants as the Golden Honeysuckle, *Vitis hetrophylla variegata*, *Clematis paniculata grandiflora*, *Ampelopsis Veitohii*, and *A. Virginica*, Climbing Roses, and the "Bonnie Brier Bush." The low-growing plants are *Tradescantia commelina*, and *T. Virginica*, *Aegopogon*, *Euonymus radicans*, *Phlox subulata*, *Azaleas*, *Opuntia*, hardy *Pyrethrums*, and the fragrant Southernwood." The distant corner of the border just spoken of is seen in the right side of this view.

"One of the pleasures of the Herbaceous Border is that a flower of some kind can be picked from it any time during ten months out of the twelve; there is always something coming up, or in flower, and a walk along it every morning reveals something not seen before."—SAMUEL HENSHAW, Landscape Gardener."

### A Reliable Old Window Plant.

In recent years there has been a very wholesome reaction in gardens in favor of what are known as old-fashioned hardy plants, such as paeony, phlox, ferns, etc. There comes to my mind one of the oldtime window and greenhouse plants, that is deserving of much more attention than it is now receiving. It is a wax plant, *Hoya carnosa*, sometimes called honey flower because the pretty blossoms are tipped with honey drops. For adaptability to the average treatment that plants receive in our homes, it easily stands second to that iron-clad, the English Ivy. It can be killed, but the chances of this are slight compared with the average house plants. Some florists, who run the plant along the rafters or over the back walls of their greenhouses, claim that the more the plant is neglected the greater is the yield of flowers. I do not make this well-grounded statement with a view to encouraging ill treatment of the plant. It must be borne in mind that the worst treatment that plants ordinarily receive in a greenhouse is approximately as good as would be good treatment in the window garden.

On one account the wax plant is better suited to house culture than is the English Ivy. The wax plant is a lover of heat; its heavy, fleshy leaves stand atmospheric dryness almost as well as do those of a cactus. For this reason it may be trained about the top sash of and over a window, where the air of the room is the hottest, and thrive all the while.

An objection would be raised to the wax plant by some, to the effect that it is a slow grower while young. This frequently is the case, but at the same time let it be said that once it is under way no house plant grows faster. The slowness of growth at the start, however, may be overcome in some measure by treatment. It is a plant that does not like much moisture at the root during the period of slow growth, therefore be careful not to keep the soil anything like soaked. The plant is not a great rooter, hence does not require as much pot room as does the average house plant. One way, therefore, of hastening growth and bloom is to keep it in rather a small-sized pot. As for soil, one consisting of about one-third sand, the balance a rich loam, and withal a considerable portion of little pieces of pounded bricks, will suit it well.

The annexed engraving, showing a young plant raised by layering (a very good way to propagate), gives a good representative of the flower truss, as well as of the foliage, of the wax plant. The flowers are very attractive

and wax-like, of a pinkish white color, with a dark star-like protuberance in the center. It cannot, however, be called a profuse flowerer.

Although the wax plant is well adapted to training about a window, it forms handsome specimens when grown over a trellis. One of the finest is the globe or the balloon shaped trellis.

In the matter of temperature, the wax plant enjoys a warm place, and will make little growth in any other. About 60 degrees as a night temperature suits it well, but its remarkable adaptability will enable it to get along where it is much cooler, although here no growth can be expected.

This plant is almost insect proof; hardly another besides the mealy bug will touch it in the window garden, and this can be easily kept down by washing with warm soapy water. In speaking of this old favorite, mention should be made of some other members of the genus that are fit companions as window and hot-house plants. *Hoya bella* is more slender in

FIG. 12.—THE WAX PLANT: HOYA CARNOSA.

growth and has smaller leaves than *H. carnosa*. Moreover, it enjoys a little higher heat, and is well suited to a warm sitting room window.

Being of more delicate habit, it is sometimes grafted on strong growing kinds like *carnosa*, in which case it grows faster and blooms more freely than on its own roots.

ELIAS A. LONG.

**Reforestation.**—The Fall Mountain Paper Company (Mass.) has been studying for the past few years, methods of reforestation their large tracts of wild land, and the past season have gathered large quantities of Spruce cones, to be planted on their cleared lands in the upper White river valley. It owns nearly half of the towns of Hancock and Granville, and large tracts in Rochester, Pittsfield, Stockbridge and Chittenden. Its policy will be to keep the growth of the young trees equal to their cuttings of the old, so as to make the supply permanent.

### Preparing the Soil for Crops.

The matter of preparing the ground for the future crop is one very much neglected, the plowing or digging very indifferently done, and the ground just turned over the regulation 5 to 8 inches in depth. No one has a right to expect a good crop of vegetables to succeed on such shallow soils, for when a drought comes, as it invariably will every summer, the plants dry right up and will wilt down flat, thus receiving a check that frequently encourages lettuce to bolt to seed. The same with celery, and what were intended for cauliflowers turned out only buttons, and so on indefinitely. There are some soils that will absorb moisture from the atmosphere, or by capillary attraction better than others. Fertile and deeply pulverized soils containing finely divided clay, some sand and lime, with a good dressing of organic manures, will supply moisture to plants for a much longer period than others not so constituted. I have found onion roots 17 inches below the surface on ground that was trenched 2 feet in depth, growing unchecked all through the season; the bulbs were pictures to look upon, they were so fine.

Many garden soils, after years of intensive cultivation, become sour, the surface during the growing season quickly showing a sticky green. This is due to the accumulation of undecomposed organic matter in them. Many soils are also deficient in the phosphates. Whenever possible it is good practice to trench such soils somewhat more deeply than they were turned over previously, putting a layer of manure in the bottom of every trench, also a sprinkling of bone dust to supply phosphoric acid. After completing this, apply a liberal dose of fresh lime on the surface, harrowing or raking it—not plowed or dug in to any depth; lime will work its way down quick enough, and will have a beneficial influence on the soil by neutralizing the acidity causing the sourness, and decomposing all organic matter. Lime will also break up heavy clay soil and bind loose sandy soil. It will not, however, take the place of organic manure, but it will make the plant food already in the soil more available for absorption by the roots, and not the least important is the fact that it is peculiarly obnoxious to many insects and cut worms that may be in the soil. One of the many advantages of well-drained, deeply pulverized soils is that they quickly warm up in spring. When the particles of soil are full of water, as during rain, the air it previously held was displaced by the heavier water, and as quickly as this water soaks away, fresh warm air enters from the atmosphere and warms the soil. This is important for those desiring early vegetables, as plants cannot grow satisfactorily where the roots are much colder than the prevailing atmosphere; but where water freely enters and as freely passes away, and fresh air enters, the soil becomes warm and vegetables then grow.

**Apple Exports to England.**—Returns from the apple shipments to England from New Hampshire this season, says a local paper, show the business to have been a dismal failure, and prove this to have been the most disastrous apple year in the history of this section. The actual cost per barrel to the farmer was 60 cents. From their various shipments they have received prices from 19½ cents to 90 cents, and on the last shipment there is an extra charge of 1¼ cents per barrel. At these prices only three shipments brought any profit, and each succeeding one showed an increasing loss, until on the last one the farmers have had to pay charges of 1¼ cents a barrel for the privilege of sending their fruit abroad.

## Concerning Carnations.\*

The Carnation to-day is one of the most popular garden flowers, and regard for it has entered so deeply into the hearts of flower lovers that no mere caprice of fashion will ever appreciably effect its standing. It fashion deigns to favor it for a season, it is only still more in request, but though fashion changes to other flowers to gratify its whims, it is almost certain to have aroused other sympathies and respondent love.

### Origin and History.

Lost in the dim obscurity of distant ages, and, so far as we know, unrecorded, are the initial efforts of those who began the work of developing and improving this flower. Whether there was first a vari-colored race of single-flowered forms, or how and when doubling took place the oldest records of this flower tell not, yet it has an ancient history, and was much beloved when outdoor garden flowers were few indeed, and glass floriculture unknown. The early stages of its evolution into a flower of such varied beauty were hardly chance results, for we know the wild type and parent, and you may see it to-day still the same, ekeing out a perfect subsistence upon old castle and

pictures of the early Dutch Painters Carnations are unmistakably and admirably portrayed.

The most interesting feature in the flower's modern history is its amenability to development and improvement along well defined and widely divergent lines, till to-day we have several distinct classes diverse in constitution, in habit of growth, period of blooming, form of flower, and variety of coloring. Most interesting and instructive especially is the latest acquisition of a race adapted to the requirements of the cultural systems practised in this country, which alone has brought this flower rapidly into the prominent and well-deserved position it now enjoys here.

It will at least be interesting, if not of decided practical value, to growers in this country to briefly review and remark upon the characteristics of the several classes of European Carnations.

### European Classes.

The earlier Carnation fanciers appear to have been most attracted to the bizarre or oddly colored varieties, for as early as 1769 the Carnation was classified according to color vagaries under the names of Flakes, Bizarres, Picotees, and Painted Ladies. The varieties belonging to the three first named classes found not a few admirers; they be-

tended popularity of Carnations that marks the last decade. The flower as a unit, quaintly variegated in color, did not appeal to many, but when it was to be had in clear, bright, and simple colors, wedded to a charming fragrance, it soon came into general request to decorate the gardens and adorn the house. In some of the best English flower gardens the Carnation, in fine self-colored varieties, has been elevated to its rightful place as second only to the Rose, which it succeeds in time of blooming. These are distinctly summer bloomers, with a few slight exceptions, and to what extent, or, indeed, if they are fitted at all, for outdoor culture in this country, has yet to be determined. At a future date I may be able to give a more definite expression of opinion regarding their behavior under American summer skies, having some on trial.

The so-called tree or perpetual flowering Carnations make another distinct class. In England they are grown in pots and pass the summer in the open air, being housed for the winter flowering. In their season of blooming, and its long continuance, they possess apparently acquired and immutably fixed characteristics developed along another divergent line.

This class has its counterpart in this country, embracing those varieties now flowering on the benches. But whilst there are winter flowering Carnations in England and America, they form two well-defined classes.

### Carnations in America.

The history of Carnation culture on this side of the Atlantic should not be hard to write, since it hardly embraces many decades. Knowing little of the origin of the American Carnation, and having had but small experience in their growth, it would perhaps be presumptuous on my part to attempt to go closely into details of management, but as far as my observation goes, there are some fundamental principles to be observed, and certain important factors to reckon with in all successful Carnation culture; whether you practice it on this side of the water or the other.

I believe that these American varieties are offspring from the perpetual flowering varieties, raised and sent out by Mons. Alegatiere, in France, as also were most of the winter flowering kinds first grown in England. It would be interesting if we could mark the parting of the ways, the beginning of the separation into two families, for as we see them now they have a well-marked divergence of character or habit. The varieties of European growth make large plants. They have a main central stem, and I have often seen plants up to 3 feet in height well furnished with side shoots, which produce the flowers on comparatively short stems. Here we have varieties of a close and tufted growth naturally inclined that way, and rendered more so by summer pinching, and when they flower, the flower-spike disbudded to the terminal bud attains a length of from 12 inches to 24 inches or more, according to the kind, and if well grown the stems are strong enough to stand erect and support the flower. These stems are cut right down at the base, and when cut are quickly succeeded by others, and this continues for months. All the varieties in cultivation here partake of the characteristics of the earlier types of Carnations in having fringed petals, more or less of fragrance in the flowers; in short, they represent the embodiment of what a Carnation should be, possessing variety of form and expression, light and shade, and more satisfying by far to the majority of flower lovers than the smooth-edged, flat-petaled, geometrically formal type of flower. So much for the American Carnation as a distinct type.

We may now with profit briefly look at some of the individual varieties. It is not my intention to say much about them, for, as in most of the popular branches of floriculture, we are in a state of perpetual transition as regards kinds. Those generally grown to-day are superseded and discarded a year or two years hence by novelties not always of superior merit. Carnation growing here, however, being yet in its infancy, we may for a time reasonably look for, in fact we have before us evidence of, marked improvement in some of the new candidates for popular favor.

(To be continued.)

FIG. 13.—THE "OLD-FASHIONED" GARDEN. (See Page 33)

fortress walls, as at Rochester, in England, whilst across the channel, in Normandy, high up on the enduring ruins of ancient feudal towers, it lives on, braving the storms in winter; in summer perfecting its by no means attractive flowers, and ripening seeds that find an ample seed bed in the flint masonry. Here it knows no spot nor rust, and eel worms and wire worms have not to be reckoned with.

Such are the conditions under which grows *Dianthus Caryophyllus*, which botanists agree is the type and parent of the Carnation. *D. Caryophyllus* is but one of a very large family, and Mr. F. N. Williams, who monographed the Caryophyllaceae, told us that four or five species of *Dianthus* had possibly been used in hybridization, but we have no direct proof.

It is known, however, that the Carnation was cultivated in England during the reign of Edward III., 1327-1357. Chaucer mentions it in 1386, calling it the "Clove Goffe."

The modern name Carnation was mentioned by Henry Lyte, in 1578. Gerrard, in his "Herbal," published in 1597, mentions a yellow Carnation that a merchant of London procured from Poland, "and which became that time was never seen nor heard of in these countries." In the beautiful flower

came "florists' flowers," their improvement was taken in hand by a small body of enthusiastic florists who set about evolving their ideal Carnation in form as precise and perfect as though cast in a mould, its petals smooth and without fringed edges, the several colors as clearly and as sharply defined as though lined out upon a color chart, and to assist the eye in seeing all the good points of the flower when placed upon the exhibition table, its petals were severally arranged with tweezers, supernumeraries withdrawn, and when the "dressing" was complete the bloom was inserted in a round white paper disc. You may see this done yet at the annual shows of the English Carnation Society, and there is a tolerably large body of enthusiasts who take a delight in it, but it is not the type of Carnation that appeals to the great flower-loving majority. It represents, however, many years of patient work, and it is a wide gulf that separates the simple single one-colored wild Carnation from the most perfect refined high-bred Bizarre or Flake of to-day.

### The Clove Carnation.

A very old class is the Clove, the name having reference to the clove-like odor of the flowers, which are self or one-colored. There are now many varieties belonging to this class in which we may embrace all selfs, and it is these that have been mainly instrumental in bringing about the greatly ex-

\*Paper by A. Herrington, Madison, N. J., read before the Morris Co. (N. J.) Horticultural Society, May 13, 1897.

## That Plant Registration Bureau.

In your issue of Jan. 2, page 12, Mr. Howard Miller presents his ideas in regard to the proposed Bureau of Plant Registration. As a member of the committee, I wish, if possible, to correct false impressions or misapprehensions in regard to this matter.

In the first place, the idea of plant registration is not the testing of varieties, neither is it to be made a means of distributing seeds or plants. It is not intended to handicap the originator or introducer of a new variety or species, but, on the other hand, to give him a sort of precedence by an official guarantee in the form of a registration number and a recognized name. It is not the idea that plants can be patented or copyrighted, but that the general public will, in self-defense, buy only officially registered stock. The person, therefore, who neglects to procure official recognition from this national agency will be disregarded by enlightened buyers, and in order to successfully compete with others in the same business, he will find it to his advantage to procure the Government seal upon his introductions. It will work the same as the fertilizer laws do. Manufacturers have their goods analyzed and registered in West Virginia, because they wish to put them on the market in that State, and because they know that intelligent buyers will not purchase a brand that does not carry the marks of registration given on all brands analyzed by the Experiment Station of that State. I anticipate that it will not be long before people will be as careful to require the official tag on fruit and ornamental plants as are the purchasers of commercial fertilizers nowadays.

To comply with the requirements of this proposed bureau would be no hardship, and would entail no loss of time to the originator or introducer, for certainly no conscientious grower would put a plant upon the market before having thoroughly tested it for himself, and before he had produced a stock sufficient to meet the requirements of introduction.

The idea of a novelty catalogue is a good one, and would be of great aid to all classes of growers, but it does not and cannot cover the ground of the proposed registration system. The one in nowise interferes with or overlaps the other.

The aim of the proposed scheme is to defend both buyer and seller; to eradicate fraud and the factors which stimulate falsehood and misrepresentation on the part of agents and advertisers. It is hoped that the official number will be considered as binding as a bond upon producer and seller, and the fraudulent use of the privilege shall be made a misdemeanor, subject to heavy penalty.

L. C. CORBETT.

—After reading the article in your issue of Dec. 12 last I wrote a letter on the subject, which I intended to send to you, but Mr. Howard Miller, of Union County, Pa., has so nearly expressed my own views on the question, that there is but little more to be said, at least by me.

It is well known that in all departments of the Government there is so much of "red tape"—which, I suppose, is necessary—that the institution of a department such as is proposed, compelling each originator of a new fruit, flower, grain, forage or textile plant to first place it in the hands of a Government bureau, to test and

determine its value, and which bureau would be at liberty to consume all the time it fancied in making and reporting as to its merits, would be to place the originator of a plant of possible value in a position that would be an injustice to him. Its effect would be to, in a great measure, discourage people who take an interest in experimental work from making further efforts in the crossing or hybridizing and growing of seedling plants. Besides, in order to establish a Government bureau that would be qualified to intelligently pass upon the merits of a new fruit or other plant, it would be necessary to have sub-stations in at least every Congressional district in the country. Even should the reports from a majority of these stations be favorable to a new fruit or plant, the report would be of but little value to the average planter.

Suppose, for instance, that I have originated a new variety of strawberry, one which I believe to be of value. I would first have to notify the department; next, I would have to furnish all the sub-stations, as well as the central station, with plants for testing. This would cost as much as the novelty would be worth, and yet after furnishing the plants I would have to wait at least two years before the bureau could determine even the possible value of the variety. All this time my plants would be in the hands of more than a thousand growers, and I would practically have lost all control over the stock; and the only way in which I could hope to receive any return for my labor would be directly from the Government, in the shape of a pension.

Again, as to value of the reports. Should those from the station nearest me be favorable to a new variety of fruit, it would not prove that the novelty would be a success under the cultivation and soil conditions that I would give. I have had some little experience in the originating and introducing of new fruits, and I certainly would not be in favor of Government control for any new thing in which I had an interest, if I ever expected to get anything like a reasonable return out of it. While favorable reports from experimental stations and specialists are of value in the way of an advertisement to the introducer of a new fruit, they are of but little value to the planter, whose method of cultivation and soil conditions may be different from those of the station where the trials have been made. It should always be remembered, regarding favorable reports on new fruits or other plants that are sent out by experiment stations or by specialists, that these plants have been given the very best possible conditions; conditions such as the average planter seldom gives, and in forming his own estimate of the variety, should discount the opinions accordingly.

The only experiments that are of positive and practical value to the planter are those which he has conducted on his own soil and under his own methods of cultivation, and for this reason every fruit grower should have experimental grounds of his own where to grow and fruit a few plants of all the most promising introductions. This will cost but little in time or money, and will be found to be much more satisfactory and profitable than to jump in, purchase at a high price and plant largely of a thing that may prove to be utterly worthless on his soil. If after one season's fruiting the candidate proves to be of

value, one can soon work up a stock of plants at little cost. If it proves to be of no value, the experience has been gained at small cost.

To the originator of new fruits I say hold on to them until you are ready to send them out; then those who buy will do the experimenting, and they will soon let you know whether or not your berry is of value.

Push the novelty catalogue idea, and let the Government Bureau scheme go by the board. Even should the practical working of the bureau prove to be all that its friends expect of it, by the time that its reports are printed and distributed through the usual channels, the information offered will have become ancient history.

W. H. RIDGEWAY, Wabash City, Ind.

## The Fruit Garden.

Strawberries will need no attention for the next six or eight weeks. In the meantime let us look back and see what progress we made in the past season; having brought forward for competition with the older kinds, Greenville, Mary, Marshall, Timbrel, Hunn and Brandywine. In Michel's Early we have a productive plant with berries of fair flavor but of short season. Crescent, ripening at the same time, has a longer season and is very productive, but not quite so sweet; plant a vigorous grower, altogether a good old variety which can be found in most catalogues. Wilson is another old kind which gives a heavy crop of firm, medium sized berries; just the kind for preserving; they will look something like strawberries when used in mid-winter. Parker Earle and Sharpless take up the mid-season; the latter is too well known to need comment. Parker Earle sets a wonderful number of berries which are of fair quality and fine color; yet, here it is not satisfactory and probably will have to give way to Brandywine or Greenville, which are both good. Greenville, for size and productiveness, Brandywine, for color and size. Gandy is not a handsome berry nor very prolific here, but is a very sturdy grower with large berries of good flavor. The most satisfactory late berry here is Jersey Queen; perhaps it is too soft for market, but is a fine, handsome berry for table use, is slightly acid unless fully ripe. It is a poor grower and needs the very best of treatment. Mary, Timbrel and Marshall did not come up to my expectations. Hunn I did not receive in time to justify an opinion at present, only that the growth is clean and vigorous.

Currants. — Fay's prolific is fine, even though the bush be not graceful and inclined to break down, or reach the ground at the wrong time, making it very necessary to have a mulching to keep the fruit clean. Although really not quite so early as Cherry it can be used as early for the berries are not so acid. For white, White Grape is the best, these, with Victoria for late, will cover the whole season.

Currants for Market. — For market the Cherry currant is perhaps the most serviceable, as the ground, if cultivated, is most easily cleaned about the Cherry than around Fay's without danger of breaking the bushes. Also the yield may be slightly more in weight, yet a basket of each, side by side, will show a decided difference in favor of Fay's.

Black Currants with us have no call only from inquisitive children, or inquiring friends from over the pond. The variety grown, Black Maples, is a strong grower, requiring little attention except to thin out the oldest branches when they become too thick to admit light and air.

J. HOLLOWAY, L. I., N. Y.

## Destructive Insects and Methods for Controlling Them.—II.

PROF. W. G. JOHNSON.

### The Codlin Moth.

Every lover of fruit is familiar with the so-called "worm" common in apples, but there are possibly some readers of this paper who are not aware of the fact that this repulsive creature is the young of a very beautiful little night-flying moth. It is not a native American insect, and was introduced into this country nearly a hundred years ago from the old world. Perhaps there is not a fruit grower in the United States who has not suffered more or less from its ravages. If we could ascertain the actual loss occasioned by it no doubt the figures would excite incredulity, as millions of dollars would not cover it.

#### Its Life History.

The adult or parent insect, which emerges from its winter quarters about the time the trees are in full bloom, is very rarely ever seen by the average observer. It is a small brownish-gray moth, with a wing expanse of about three-quarters of an inch, and is represented in the illustration (fig. —) at *f* and *g*. The eggs are laid upon the forming fruit about the time the petals or blossoms fall.

It has been generally believed that the eggs were laid in the calyx cavity, or the point where the blossom had dropped off, but Prof. Slingerland, of Cornell University, has observed that they are deposited at almost any point on the surface of the apple. The worm emerges from the egg in a few days, and after feeding on the outside for a day or two, makes its way into the fruit, usually entering at the blossom end. It burrows its way into the core, moving freely upwards and downwards, and enlarging the entrance hole to push out the excrement.

Full growth is attained in about a month, at which time the infested apples begin to fall, but whether they fall or not, the worm bores to the side and issues through a round hole, as shown in the cut. A worm emerging from a fallen apple makes its way back to the trunk of the tree, or other convenient place, and transforms in some crevice or under some piece of loose bark. Worms coming from fruit still on the trees crawl down the branches, until they reach the rough bark, where they spin their cocoons. Usually about two weeks elapse from the time the worm leaves the apple before the full-fledged moth appears. There are two broods, except in the northern part of the country, the moths of the first brood appear about midsummer, and lay the eggs for the worms found in the ripe apples.

#### Remedies.

It has been customary in some fruit-growing sections to wrap the trunks of trees with paper or rag bandages. Although productive of much good, this method has been superseded by a simpler and better one. It has been found that trees can be protected by spraying them with one of the arsenites. One spraying is sufficient under favorable circumstances, but usually it is better to spray twice, and, if rain interfere, even a third time. The first spraying should be applied just as soon as the blossoms fall, and the second a week or ten days later if the weather be favorable.

Spraying with Paris green is now generally used by the most successful and advanced apple growers of the North and West, especially where a sufficient

number of trees is grown to justify the purchase of the proper spraying apparatus. Many of our apple growers, particularly in the South, have failed to appreciate its importance, and fancy that the time and means required to spray effectively are lost. To be effective the spraying must be done before the worms hatch, and the mixture must be on every fruit to be protected. If a film of poison can be kept on the blossom end of the fruit until after the eggs hatch success is assured.

A fine spray well directed from the center of the tree is most effective. One pound of Paris green or London purple in 150 gallons of water is a good strength. Some growers use a mixture double this strength, but much care must then be taken not to burn the foliage.

The illustration here used is copied from a drawing by the late Dr. C. V. Riley, formerly U. S. Entomologist.

Md. Agt. Col. and Exp. St'n,  
College Park.

### The Forcing House.

Vegetable Forcing after this date will be much easier work than it has been up to now. As the days begin to lengthen, the better light has a telling effect. If the efforts to maintain a supply of vegetables have so far succeeded, there should be no difficulty

FIG. 14.—THE CODLIN MOTH.

from now on. As I have before stated, rotation of crop is necessary on a private place, and where there is space at command, it is an easy matter to keep up a continuous supply during the winter months.

**Beans.**—For a private establishment this is a very satisfactory vegetable. By growing them in a temperature of 55° at night, with a rise of 10° during the day, a good yield can be expected, providing air is given at every chance. In watering this crop I find it best to give a thorough soaking, and then to wait until the soil gets fairly dry before watering again; by this method the soil will be kept in good condition. When the soil gets sour, good vegetables are out of the question. As to varieties for forcing, *Ne Plus Ultra* and *Warwick* answer our purpose.

**Lettuce.**—Some people entertain the idea that a greenhouse is necessary in order to produce good lettuce during the winter months. Good lettuce can be grown in cold frames up till the first or second week in January. *Grand Rapids* is a good variety for frame work, especially in winter. A sowing of lettuce should be made now for setting in the frames in February. *Big Boston* is one of the best for that purpose. It is a good policy to have on hand young plants all the time, for it is an easy matter to throw away what are not needed.

W. TURNER.

### The Vegetable Garden.

**Good Seeds.**—There is a vast amount of difference between reliable and tested seeds procured at a fair price from a responsible firm and those procured from irresponsible parties not conversant with the business. Without good seeds we cannot expect good crops. Cheap seeds are dear at any price, frequently resulting in disappointment and loss. Better buy from those who have a reputation, which gives a reasonable guarantee of purity and freshness.

**Government Seeds.**—These should be condemned. I have not found them reliable, and usually of varieties not suited to our needs. Most of those we received last year never germinated; it was only a waste of time and ground to plant them. It is better not to depend upon them.

**Suitable Varieties.**—The mistake is frequently made in the selection of the most suitable varieties of vegetables, usually the largest and coarsest are grown without any regard for quality, such as potatoes, celery, squash, cabbage, tomatoes. The medium sized varieties are more satisfactory for culinary use and for keeping qualities. There are old standards that should always be grown, as *White Plume* and *Sandringham* celery; *Dauvers* Yellow onion; *Trophy* and *Perfection* tomatoes; *Thick-leaved*, for spring, and *New Zealand* spinach for the hot months; *Hollow Crown* parsnip; *Nott's Excelsior* and *Laxon's Fillbasket* peas are in my experience the most prolific. The *Banquet Melon*; the popular *Trionon Cos* and *Curled Simpson* lettuce; *Cory*, *Amber Cream*, *Stowell's Evergreen*, and *Country Gentleman* corn; *Early Snowball* cauliflower; *Early York* and *Jersey Wakefield* cabbage. *Brussels Sprouts* are not as well known as they deserve to be. They are the sweetest of all the cabbage family: *Egyptian* and *Dewing's* beets, *Large Pole Lima* and *Golden Wax* beans. *Swiss Chard* is handsome and useful. The *Whitloof* chicory makes a splendid salad for winter use, and is much appreciated by those who have used it. Some of the newer varieties should be tried yearly on a limited scale, until their merits or demerits are discovered, and any suitable ones added to our list from year to year.

**The Ashleaf Potatoes.**—A correspondent of *AMERICAN GARDENING* recently asked if any subscriber grow these English potatoes. A few years ago I had sent me a peck of *Myatt's Prolific*. They matured early, and proved to be of such fine flavor that I could not keep any for seed. They would prove very acceptable to the table here were they grown and introduced. The *Patterson's Victoria* was a potato highly valued in England for general crop, and was largely planted in many of the best gardens there. It is a potato with a peculiarly toothsome taste when properly cooked, that I well remember, many of the leading families there would use no other. I would like to know if any one has ever tried this potato here. I see it still listed in the English catalogues, thus showing its great popularity.

W. M. EDWARDS, R. I.

**Intensive Orchard Cultivation.**—An Improved Plan for Orchard, is advised by C. G. Patton, of Iowa. His method is to plant the trees in belts of three rows and about fourteen feet apart, the distance between belts to be from thirty to sixty feet. The open space between belts to be highly cultivated by planting some hoed crop, or after a few years may be sown to clover and cut for a mulch for the adjoining belts. The rows should be run north and south. After the trees are set, cultivation should continue until they are too large to permit it, and the heavy applications of barnyard manure should be spread over the ground occupied by the belts. Low-headed trees are the best.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1896.

PUBLISHED BY  
A. T. DE LA MARE PTG. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1897.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates: 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**Protection for the Horticulturist.** THE position of the horticulturist, with reference to his place in the arena of commerce, is worthy more than a passing note at this time. His interests, as well as those of all who look to the tilling of the soil for a living, demand that there should be equitable legislation for all.

It matters not whether the political opinions and tendencies of the individual lean to free trade or to exclusive tariff; that might have been a question in the past, but the situation to-day is different, and the course must be shaped according to expediency. There seems to be no shadow of a doubt but that the coming year will see large alterations in the tariff schedules; manufacturers of textiles and other goods are looking forward to greatly advanced duty on imports, and so long as one section of persons engaged in catering to the wants of the multitude is to have its interests boosted up, so also in justice, in the name of common humanity, should the welfare of all be equally dealt with. To protect the interest of the man who manufactures in a factory of brick, by means of steam power and modern devices to lessen cost of production, and not, at the same time to render equal assistance to the man who literally manufactures the food for the people employed by the

other, is a manifest robbery from the tiller of the soil.

The horticulturist, unless he be protected on all points, not only in the ultimate products of his work, but also as regards stock, seed, etc., has to purchase other necessities of life, such as clothing, in a closed and highly taxed market, but has to offer in open market, in competition with the world, the products of his own labor, and on which he depends to exchange (in equivalents) for what he lacks.

Therefore, and under these conditions, we declare for protection for the horticulturist. The greatest good of the greatest number. Justice for all!

**Growing for Sale.** NEVER before was there a time when this subject was of more importance than at the present, and never before were skillful cultivators so exercised concerning the matter. Competition is keen, the markets are exacting, and too much attention cannot be put upon the methods of placing before the public in the best shape possible whatever is raised. To this end the series of articles on "Packing and Shipping" has been started. AMERICAN GARDENING is anxious for the welfare of the greatest number, and asks that the plainly spoken remarks in the series referred to be not misunderstood or taken hardly. The guiding light is the desire to bring home in the most emphatic manner possible, where the weakness rests, and to give readers the benefit of those special advantages it possesses in being able to watch the markets day by day, noting the disposal of all kinds of stock grown on the farm, in the garden, and the greenhouse or forcing house.

This will eventually lead us to speak more in detail about the methods of disposing of stock, but for the present there is much to be said about the preparation for market. All has not been accomplished in this way that can be done, although daily we notice creditable efforts towards, and real improvement in, this direction. This is very noticeable in the shipping of flowers. While prices are falling lower and lower, greater care and expense are being given to their preparation and shipment. Those who are not keeping in line with this march of progress will be big losers ultimately; and what is true of one branch of horticultural industry, applies with equal force to growers of fancy stock of all kinds.

Those who are not keeping in line with this march of progress will be big losers ultimately; and what is true of one branch of horticultural industry, applies with equal force to growers of fancy stock of all kinds.

Those who are not keeping in line with this march of progress will be big losers ultimately; and what is true of one branch of horticultural industry, applies with equal force to growers of fancy stock of all kinds.

Those who are not keeping in line with this march of progress will be big losers ultimately; and what is true of one branch of horticultural industry, applies with equal force to growers of fancy stock of all kinds.

**Stock for Apples.**—Let us hear the experience of some one who has had success in growing the apple worked on the Paradise stock.

A Large Tomato grown under glass was lately brought into this office by J. M. Stutzman, Edgewood Greenhouses, Westfield, N. J. It was a finely grown specimen of Lorillard, and turned the scale at twelve ounces. This variety is one of the most reliable for forcing purposes.

## Choosing Varieties of Fruit.

Far too many start into fruit raising by ordering a number of varieties of strawberries, raspberries, blackberries, pears, and apples, only to find in later years, either that the fruit is inferior, or that the trees and bushes do not thrive in their localities. Many of these mistakes are made, in the case of small fruits especially, because of the injudicious "booming" which many small fruit and other growers give new varieties in their annual catalogues. It is often the case that a strawberry that is loudly proclaimed as having all excellencies and no "outs" in one season's catalogue is dropped entirely from the same dealer's next catalogue, because it has proved worthless, but I have yet to hear of such a dealer reimbursing his customers for having invested their money because of his glowing description! The beginner is especially likely to be bitten by these new and untried fruits, for, as a rule, he wants everything "up to date." These new varieties must be better than all that have gone before, according to the catalogues, and he will get in on the "ground floor" in the berry business by starting with them!

Mistakes in small fruits are not so serious as a mistaken selection of pears and apples, for it is unfortunate business to wait ten years for a crop, and then find it a failure. Now then, how shall the young fruit grower make a start in the selection of varieties? As a rule, let novelties alone. Let someone else test them, and cull out the small amount of good from the large amount of almost worthless new varieties. The good will live and you can invest later if it is found adapted to your locality; and this leads to an important point. A variety of fruit that may be of great excellence in one locality may be almost worthless in another, because of climatic or other conditions. One must make his selections, then, according to his location, and the very best plan that I know of for him to pursue is to send to his State Experiment Station and to his State Agricultural or Pomological Society for their lists of all kind of fruits that have been found best adapted to cultivation in the state. The wisdom of years of experience, and of years of careful experiment, will be embodied in these lists, and I know of no state where official attention has not been paid to this subject. The beginner in fruit growing thus has at his command the best experience of those who are able to profit by experience, and to arrive at the truth from experience, as to what fruits will give the best results and the best satisfaction in his own particular locality. The man who will ignore such assistance, and, self-sufficient, rely upon his own inexperience, and upon the glowing words of those who have plants and trees to sell, living, perhaps, under entirely different climatic conditions—the man who will ignore such wise assistance and take his chances, perhaps deserves all the disappointment he will be likely to get. But there are many who do not know of the help their own Experiment Stations and their own Boards of Agriculture and Pomology can afford them, and for such this article is written. WEBB DONNELL.

**Against Free Seeds.**—The New Jersey State Horticultural Society, at its recent annual meeting held in Trenton, after a full discussion, passed a resolution, by a vote of nearly two to one, that the Department of Agriculture discontinue sending out seeds, on the ground that "the seeds are a nuisance to the farmers, and not even good for chicken feed."

## Packing and Shipping.—II.

It is often jokingly said that there is a law of gravity whereby the most rosy cheeked apples will find their way to the top of the basket or barrel; and perhaps it is well that this is so. But growers and packers must remember that the mere placing of a few "extras" or "fancies" on the top of a shipment does not constitute the art of packing; moreover, it would, indeed, be more to their ultimate advantage to allow the process referred to to work itself out in the retailer's store. It is the retailer's special mission to present the best side to the public, and the grower cannot deceive either him or his buyer. When these men attend the market to buy from the commission man they have positively no eye for the artistic merits of the goods; but they are keenly on the lookout for deficiencies, real or apparent, which may be used as levers to depress the prices they must pay. The retailer's buyer looks for the substantial and perfectly certain guarantee that the package contains honestly and squarely what its grade mark indicates, be it specials, fancies, extras, No. 1, No. 2, or culls. In turn there are demands for all of these, and they will be bought at their market value. Do not for one moment let it be thought that the use of slipshod packages is advocated when it is stated that the buyer is not on the lookout for the artistic; for, indeed, there is no one more quick to appreciate neat and thorough packing than this (shall we call him professional?) buyer. This, however, only when all other things are equal.

The agent or broker knows this, and he is not slow to act accordingly.

To be a grower is one thing; to be a successful packer and shipper is another; while to be a salesman is altogether distinct from either. Rarely, if ever, indeed, does a skillful grower combine in his capabilities those of a selling agent, nor is it necessary that he should do so; but the details of packing and shipping he should make his special study, for they concern his end of the problem of distribution at remunerative prices, and are, moreover, under his control solely. As a producer he should make himself conversant with the requirements of the market, and should work in close connection with his selling agent, be in perfect harmony and accord with him, and from time to time seek to know if there be any improvement that he can suggest, either in time, style or method of shipping. The tips and suggestions thus gained, together with observations and pointers gleaned elsewhere, will be greatly to the advantage of the up-to-date, wide-awake grower, and must eventually be of considerable profit to him as against the man who keeps in his shell.

Each succeeding season reveals sterner competition and a more exacting market, no matter what is the nature of the stock, and it is only the man who pays attention to this fact that will come through with satisfaction to himself and demonstrate the unwavering nature of the law here, as in the natural world, that the fittest only can survive.

The Barberry as a Hedge Plant for Iowa, is the recommendation of the N. E. Iowa Horticultural Society. Mr. C. G. Patton, of Charles City, said he had grown the plant for twenty or more years, and that he knew of nothing that would excel it for the purpose of turning stock and rude boys from the grounds; it was perfectly hardy. The fruit is valuable for making jelly.

## The Agricultural Schedule.

On January 5, the hearing before the Ways and Means Committee the following presentations were made:

Representative Bowers, of California, in advocating a tariff on fruit, said that it was in the interest of all, the raiser and producer, to raise the present rates on fruit. The law now afforded no protection to the growers and did not yield any revenue to speak of. California could not touch cattle, the Mexican trade had killed that.

It was suggested by a member of the committee that an increase in duty would raise the price to consumers.

Mr. Bowers replied that it would not. On the contrary the fruit growers of his State would guarantee to increase production and decrease prices. On raisins, prunes, plums, and all dried fruits he asked a duty of three cents per pound. This would insure Americans a market and stimulate the industry. If given a chance California would flood the country with certain grades of fruit and furnish an excellent article at a reduced price. On oranges he requested a duty of 25 cents per cubic foot. If the fruit growers were given fair protection some \$16,000,000, which was yearly sent abroad for fruit, would be kept at home.

Senator Perkins, of California, presented the memorial of the fruit growers of California requesting the duties mentioned by Mr. Bowers.

P. B. Armstrong, of California, speaking for the almond growers, said that they had almost been ruined by the present law. He asked for an increase in the duty from 3 to 6 cents per pound, with 10 cents on shelled almonds. Some \$10,000,000 or \$15,000,000 were invested.

The president of the Fruit Buyers' Union of New York presented a memorial in which handlers of domestic produce, as well as dealers in foreign fruit, and nuts, asked that the existing tariff duties on fruit (green and dried), and nuts be left unchanged because:

"Any change in tariff duties will disturb business arrangements already perfected, and, besides entailing losses upon the trade, will deter merchants from embarking into enterprises looking to the extension of the business. \* \* \*

"It may be easily shown that an increase in tariff duties will not benefit home producers. Indeed, an increase in such duties would ultimately work injury to the very interests which protective tariffs are designed to protect and foster.

"We desire also to direct your attention to the fact that the growers of oranges in California are not benefited by high tariff duties on foreign oranges, nor injured by low duties on them. The oranges grown in California are of superior quality and are so much more attractive in appearance than the oranges imported from foreign countries that the two products are scarcely competitive. In the West the California oranges, when obtainable, are used to the exclusion of all other oranges. In the East the fancy varieties of California oranges are in good demand and command high prices. But for this very reason they are regarded as the rich man's fruit and the cheaper oranges of foreign countries are looked upon as the fruit for the masses.

"The extent of the traffic in exporting apples is also worthy of your attention. From January 1, 1896, to October 1 of the same year, there were exported to England and Europe from the port of New York alone, 13,744,543 pounds of dried apples, and from all ports of the United States, 2,633,927 barrels of green apples. During the same period there were also exported from this port to England and Europe fruits other than apples of the value of \$1,700,000, and nuts of the value of \$70,000.

"This country at certain seasons of the year imports from Spain, by the way of England, considerable quantities of oranges and other products. Hence, the imposition of high tariff duties upon fruit and kindred products would affect not alone the business done with Italy and Spain, but as well that transacted with England, France, Germany, Belgium, and other European countries, and our immense export traffic with these countries would be disturbed and its growth retarded. \* \* \*

David Lubin, of California, applied for an export bounty on all agricultural products.

Mr. Leonard Rhone, Master of the Pennsylvania State Grange, said that the agricultural schedule discriminated against the farmers, while the interests of the manufacturers were cared for. He advocated an export bounty on all agricultural products.

State Senator C. C. Brown, of Pennsylvania, also a member of the National Grange, presented resolutions adopted by the Grange, favoring the bounty system.

A. J. Wedderburn, representing the State Grange of Virginia, appealed for an export bounty on agricultural products.

Edward N. Loomis, of Creevey, Loomis & Rogers, representing the produce merchants of New York, presented a petition regarding the regulation of the tariff on imported vegetables, as follows:

"We, the undersigned, merchants engaged in the sale of vegetables, owners of farms in the Southern States, and (or) importers of vegetables from foreign countries, respectfully show:

"That the duty upon potatoes and onions, as in the Wilson bill, was fixed on potatoes 15 cents per bushel, on onions 20 cents per bushel.

"That such duty is almost prohibitive against the early potatoes and onions usually imported from Bermuda and Cuba, the first cost of such produce being on an average of recent years, \$4 per barrel of potatoes, and 60 cents per bushel of onions. The cause of such large value at place of growth, is the high price of labor, and the very small yield per acre, compared with the yield in northern countries.

"That the duty of 20 cents per bushel is equal to 33 per cent. of the first cost of onions.

"That such duties added to cost of production so increase the selling cost in the United States as to deprive the masses from the use of early vegetables.

"That many of your petitioners are owners of, or interested in, southern farms, and are regularly engaged in supplying the principal cities with green vegetables; and

"That such supplies of fresh vegetables from Bermuda will not interfere with vegetables from farms in the United States during the early spring months, and that for many years early potatoes and onions have been purchased in Bermuda, and imported by us into the United States.

"That, therefore, your petitioners respectfully request that the duty on potatoes and onions may be placed at not exceeding fifteen cents per bushel."—John Nix & Co., A. Bennett & Co., E. P. Loomis & Co., I. H. Bahrenburg, Bro. & Co., Wm. Gamble & Co., C. P. Woodworth's Son & Co., Titus Bros., Seaman Lichenstein & Co., Furman & Page, A. G. Hutcheson & Co., Henry Brinker & Co., Olivit Bros., W. O'Brien & Son.

Mr. Loomis outlined the history of Bermuda trade under previous tariffs, and concluded by urging the placing of a low tariff on new potatoes, onions, and vegetables imported during March, April, and May, while a protective duty is placed on those products during the rest of the year when they enter into competition with home products.

He further said: "We, therefore, petition that the duty on potatoes, onions, and vegetables in their natural state may be as follows: Potatoes grown or harvested in the current year, imported during the months of March, April, and May, 15c. per bushel of 60 pounds. Onions grown or harvested during the current year and imported during the months of March, April, and May, 15c. per bushel. Vegetables in their natural state, other than potatoes or onions, 10 per centum ad valorem."

Representative Russell, of Connecticut, presented the petition of the seed farmers of southern New England, advocating a specific duty, according to the following schedule: Five cents per pound on all turnip, rape, spinach, parsley, beet, mangold. Ten cents per pound on carrot, leek, radish. Fifteen cents per pound on celery, lettuce, endive. Twenty cents per pound on cabbage, kale, onion, salsify, tomato. Twenty cents per bushel on peas and beans. Forty cents per pound on kohlrabi. Fifty cents per pound on cauliflower. All seeds not enumerated 60 per cent. ad valorem.

A committee composed of Burnet Landreth, W. F. Dreer, and W. A. Burpee, all of Philadelphia, appeared in behalf of the seed farmers, seed importers, and laborers. Mr. Landreth urged a specific duty levied on

the bushel or pound and an increase in the rates on garden seeds, claiming that unless the farmer was given practical protection he would in many lines be driven out of the business. Seed growing, he said, was the highest grade of agricultural labor and fully 80 per cent. of the cost of raising seed was expended in labor. There were 256 seed farms in the country, with a total of 169,931 acres, the value of which was about \$18,000,000. He suggested the following schedule: Five cents per pound on all seed of table beets, sugar beets, kale, leek, lettuce, mangel wurzel, parsley, radish, ruta baga, rape, spinach, turnip, and on all vegetable seeds not otherwise provided for. Ten cents per pound on all seeds of carrot, celery, onion, and salsify. Twenty cents per pound on all seeds of cabbage, cauliflower, and tomato. Fifteen cents per bushel of sixty pounds on potatoes. Forty cents per bushel of sixty pounds on all beans and peas. Twenty per cent. on all flower seeds. Five dollars per thousand packets on seeds of every kind in packets. The free list to include mushroom spawn, aromatic seeds, pot herbs, medicinal seeds, castor beans, cotton, canary, clover, hemp, tree, tobacco, mustard, flax, poppy, sorghum, and grass and oil seeds and vetches.

F. W. Kelsey, of New York City, advocated a duty of 10 per cent. ad valorem on all trees, shrubs, vines, and bulbs.

At a later hearing W. C. Barry, of Rochester, N. Y., appeared before the committee urging a duty on fruit trees and nursery stock.

### READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observations, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**English Potato.**—Replying to H. P. Manton, Man., I have tried the growing of "Myatt's Ashleaf" potato in this country; some good tubers were brought from England by a friend about seven years ago, at which time I was living at Falmouth, Mass. They grew splendidly, and produced a great crop of extra large tubers, much larger on the average than they grow in England. We thought we were right in it, so far as eating real English potatoes went, but alas, when cooked they were very unpalatable, so soapy and soggy that we soon gave them up, and did not make any attempt to try them a second year. We tried them both as an early and late potato, but with same results. I would very much like H. P. to describe the method of culture, as, under proper conditions, I quite agree that no other "can touch it for an early potato."—Jesse Robbins, Carlisle, Pa.

**Tobacco as a Window Plant.**—Not all flower-lovers may be aware of the fact that the flowering tobacco, so-called, is a half hardy perennial, and that old clumps taken up and potted in the fall of the year, and placed in an ordinary bay window, will commence flowering about New Years, and keep the window gay with their pure white flowers all through the winter months. For several years I have made it a practice to pot up my tobacco plants, which were planted in the spring, and which have been in bloom through the summer, after the first killing frost. I remove the old flower stalks, and all decaying and yellow leaves, and place the pots (6 or 7-inch, as a rule) in a cold frame for two or three weeks, then they are taken to the bay window in the house, where they are kept at a night temperature of from 55° to 65°. In order to keep down the aphids they require a good syringing with tobacco water at least once a week.—L. WILD, Wilmington, Del.

**The Mexican Strawberry in California.**—After three seasons' trial of the Mexican strawberry, with all the other lead-

ing varieties, we must accord it with being the largest and most productive strawberry in cultivation; the Marshall is far behind it in size, and the Haverland is almost its equal in productiveness. The Mexican strawberry, after the plants get well established, will yield at the rate of three quart boxes of fruit to the single plant. This variety of strawberry should be set wider apart in the rows than most other varieties, on account of its forming such massive fruit crowns; the Mexican strawberry attains a height of from fourteen to eighteen inches; the leaves are quite large, of a dark vivid green; the blossoms are large and staminate. On old plants, the leaves entirely screen the blossoms, so that in early spring, when many other varieties are killed by frosts, the Mexican escapes unharmed, as the large leaves protect the bloom. The fruit is of a beautiful cherry red color, and most deliciously flavored. In our locality, a very heavy crop of berries is always harvested from the Mexican strawberry in November. Young plants yield quite a crop the first season after being set out. At four years of age, the plant has reached its full bearing maturity; it ripens its fruits from medium season to extreme late. For a home market, the Mexican cannot be excelled. It is not a very good shipper; still, it would probably carry well to at least a distance of 500 miles.—S. L. WATKINS, Grizzly Flats, Cal.

**The Casabanana.**—This new fruit, known botanically as *Sicania odorifera*, is one of great value. It is one of the handsomest climbing vines ever introduced, as well as a most superior fruit-yielding plant. It can be counted upon as a success wherever the melon will flourish, and belongs to that family; it will climb to a height of fifty feet in one season. The fruit is about eighteen inches long, and about three inches in diameter, and is of a brilliant red color when ripe, and possessing a strong pineapple fragrance. This fruit is very superior for preserves, and in an unripe state, it enters into the composition of many kinds of curry. For cold climates, seed should be started in boxes in the house, and afterwards transplanted to the open ground; but in warm climates, the seed can be planted in the open ground in early spring.—S. L. WATKINS, Grizzly Flats, Cal.

**Staminate Flower Wanted for Haverland.**—Is there a variety of strawberry the same shape and color as Haverland, but with perfect blossoms? I find the Lovett a good variety with which to fertilize Haverland, but wish to find a variety which bears a fruit of the same shape and color as Haverland, only with blossoms strongly staminate. My soil is a clay loam.—C. W. A., South Granby, N. Y.

**Old Asparagus Roots.**—For the information of A. T. G. (page 7), I give my experience. About ten years ago a neighbor plowed up an old asparagus bed, and as the old roots could be had for the hauling, I concluded to do what I thought a very smart thing, and have a full-bearing asparagus bed at once. So I drove over and got two big wagon loads of these monstrous roots; next I prepared my ground and planted them very carefully. The following spring I was ready to harvest, but, alas! not a single mess of asparagus did I get that was fit to eat. Only a few spindly shoots appeared, and they were so tough as to be utterly worthless. The best way to start a bed is to use first-class one-year old roots. For my own part, I would never use any other.—C. ANSCHICKS.

I am very much pleased with AMERICAN GARDENING. It is one of the best journals of the class that I receive. I would not like to do without it.—DR. T. R. CLARK, Nebraska.

# Good Hood's Sarsaparilla

Is Hood's Sarsaparilla, because it cures the severest cases of scrofula, salt rheum, dyspepsia and rheumatism. If you are a sufferer try

The best—in fact the One True Blood Purifier.

**Hood's Pills** cure Liver Ills; easy to take, easy to operate. 25c.

**BUFF LEGHORNS.**—Winners for five years. Circular free. GEORGE S. BARNES, Battle Creek, Mich.

**SEEDS** Early Minnesota Tomato—the earliest. New Wisconsin Golden Salsify—the best. Pkts. 10c. each. C. S. Bond, Geneva, N.Y.

**GRAY HAIR MADE DARK** By a hairless Home Wash. Also makes the hair grow. Full directions and recipe for 25c. Mrs. A. MUNTLEY, 6212 Evans Ave., St. Louis, Mo.

**Berkshire**, Chester White, Jersey Red and Poland China Pigs. Jersey, Guernsey and Holstein Cattle. Thoroughbred Sheep, Fancy Poultry, Hunting and House Dogs. Catalogue. S. W. SMITH, Cochranville, Chester Co., Penna.

**BEEKEEPERS!** SEND FOR sample copy of **CLEANINGS IN BEE CULTURE.** A Handsomely Illustrated Magazine and Catalogue of **BEE SUPPLIES.** Valuable book on Bees given FREE to each one who mentions this paper. **THE A. I. ROOT CO., Medina, O.**

**OUR NURSERY STOCK** is grown on the banks of the Hudson River. It is First-class. Prices are Low. 50 acres of **FRUIT TREES,** Plants, Vines and Ornamental Stock to sell. 1897 Catalogue free. **T. J. DWYER, Cornwall, N. Y.**

**FLORA of JAPAN & CALIFORNIA** Chinese Narcissus, over 100 varieties of Lily Bulbs, Camellias, Palms, etc. **HARDY PLANTS,** Japan Maples, Iris, Clematis, Cacti, Flower Seeds and seeds of the most interesting and beautiful plants of California and Japan. Send for our richly illustrated Catalogue of 48 pages giving full descriptions of above. **M. H. BERGER & CO., San Francisco, Cal.** (ESTABLISHED 1887).

## Pea Growers!

Will some of our Canadian friends oblige us with names and addresses of reliable growers of this stock for seed. Information wanted on behalf of a foreign firm intending to place their future orders in that country. Address

Business Manager, American Gardening.

**Maule's Seeds** **LEAD ALL** Have done so for years, and are as far ahead in '97 as ever. If you want the Best Garden you have ever had, send address on a postal TO-DAY for New 1897 Seed and Plant Book. It is a wonder. Address **WM. HENRY MAULE, Philadelphia, Pa.**

## Some Problems in Experimental Horticulture.\*

By PROF. W. M. MUNSON, Maine State College.  
[Concluded from page 24.]

As a corollary to the subject of plant breeding we may consider for a moment

### Acclimatization.

Acclimatization may be briefly defined as the inuring of a plant to a climate at first injurious. From the time of Lindley (1799-1865) many of the best horticulturists have contended that acclimatization does not occur; that plants cannot be modified so as to prefer conditions other than the natural ones. "All plants," says Lindley, "demand a particular climate." \* \* \* We have to accept these conditions as absolute and ultimate truths without explanation and without remedy. We have no power over the conditions of the plant itself.\*\* Is this true? Is it impossible that any individual plant may become modified in constitution or in habit and thus adapted to different climates? Most records on this point are negative, and the general opinion is that a change in the individual plant is impossible. The truth can only be determined by growing the same plant in different climates. This may be done—has been done—by taking cuttings from the same plant and growing them in different regions. It is said that grape vines taken from France to the West Indies rarely succeed, while those imported from Madeira or the Canary Islands thrive well.\*\* Now, since the vines in Madeira came originally from France, there must have been modification of the original plant to bring about this condition. To make the statement of general application we may say: If a plant be propagated by cuttings, and these cuttings be taken from the original home to two other countries, and thence after a period of years to a fourth locality, if marked variations are found to have arisen we must conclude that there has been a modification of the original plant.

Acclimatization not infrequently occurs by variation in the offspring of cultivated plants, and it is in this direction chiefly that we must work in adapting plants to new conditions. By observing a plantation of beans or corn or tomatoes after a frost a marked difference in the hardness of individuals will be noticed. Now, by selection from these plants as a basis, harder strains may be produced. The Russian fruits are very good illustrations of this point. They have been bred in a cold climate so long that they are much harder than other individuals of the same species grown elsewhere. The Russian apricot is simply a hardy race of the common apricot—*prunus Armeniaca*—yet it will often stand a temperature of 30 below zero.

Without further illustration we may conclude that acclimatization does occur. In other words, that plants may be so changed under the hand of man as to become adapted to widely different conditions; and, further, that by applying the principles of selection locally or otherwise valuable races may be produced in trying climates.

\*Read before the Vermont State Horticultural Society at Burlington, Dec. 4, 1896, and communicated by the author.

\*\*Cited by Crozier, *Modification of Plants*, p. 27.

\*\*Darwin, *Animals and Plants under Domestication*, 11, 298, cited Labat in Card. n., 1863, 235.

The field is a specially important one for northern New England and for the Northwestern States.

### Domestication.

Domestication, or the inuring of plants to cultivation, offers a field much wider than is commonly supposed. In fact, there is little doubt that there are more edible fruits and vegetables still in a wild state, but susceptible of improvement, than are now grown by man.

It is but few years since De Candolle wrote: "A noteworthy fact is the absence in some countries of indigenous cultivated plants. \* \* \* The United States, in spite of its vast territory, which will soon support hundreds of millions of inhabitants, only yields as nutritious plants worth cultivating the Jerusalem artichoke and the gourds."\*\* This statement is far from correct, since our woods and fields have already yielded us all our outdoor grapes, our blackberries, raspberries and cranberries, our best gooseberries, our hardest plums, some of which are very good, and many other fruits and vegetables; while there are probably fifty to seventy-five wild species which are worthy of cultivation. The difficulty, as stated by Dr. Masters, "is rather in overcoming the prejudices against new edibles and in getting them cultivated, than in discovering them."

### "Practical Problems."

If the production of valuable types is important, care in rearing is not less so, and many of the questions concerning the treatment of fruits and vegetables are legitimate subjects for the most careful study at our experiment stations. But I would not include in this category such questions as, How shall we cut potatoes? Will plants grow if set upside down? etc. Such questions may best be answered by a single sentence: Use common sense!

Among the questions which may very properly receive attention, however, we may suggest, first of all, the treatment of orchards, with reference to feeding, culture and pruning. Little careful and accurate work has been done along any of these lines. True, in most of our manuals of pomology we have the accumulated traditions of years, but many of the statements made are based upon personal opinion rather than upon accurate data. One man is positive that the only proper treatment for an orchard is to practice clean culture—a position which is entirely untenable in many of the best orchard sections of New England. Another is sure that the best treatment is to turn in the sheep; while his neighbor is quite as positive that hogs will do better service. One man would never use stable manure; another would never use "chemicals." One man would prune severely; another regards pruning as unnatural, and would never use a knife. And so the problems multiply.

Small fruits offer problems of like importance. We know—or think that we know—that the character of the soil and the nature of the food have a marked influence on the quality and physical character of fruit, but little careful work has been done. About the only reliable data that we possess are the reports of Stone, of Indiana, and Goessman, of Massachusetts. The most widely different views are held as to time and methods of pruning, and the importance and best methods of winter protection. The origin, development and classification of varieties are

\*Origin of Cult. Plts., 448.

Scott's Emulsion makes the blood richer and improves the circulation. It increases the digestion and nourishes the body. It corrects diseased action and strengthens the nervous system. In a word, it places the body in the best possible condition for preventing the germs of Consumption from beginning or continuing their work. In that one sentence is the whole secret. Book covering the subject very thoroughly sent free for the asking.

MARBLEHEAD,  
MASS.

GREGORY'S SEED CATALOGUE FOR 1897

When ordering goods subscribers will confer a favor on the publishers by stating they saw the advertisement in AMERICAN GARDENING. We admit only responsible business houses in our advertising columns. Avoid delay and disappointment by giving name and address legibly.

also an important study—the problems concerned with which can only be made at an experiment station. The problems attending the forcing of fruits and vegetables under glass are by no means solved, and this is one of the important industries in many sections of New England. Studies of methods of construction; of methods of heating and ventilation; of the practice of sub-irrigation; of the influence of the electric light, and various other questions, have already received attention. Some of them, at least, have been considered with the double purpose of ascertaining facts which should be of immediate value, and of studying the physiological effect on the plants and thus deducing general principles. But there is still opportunity for valuable work in this line.

Propagation affords many lines of investigation that are of vital importance. For example, the mutual influence of stock and scion; the relative value of seedling stocks from different sources; the importance of top-working certain varieties, and many others. Vegetables and ornamental gardening also offer numerous important lines of investigation which, however, need not be considered at this time.

We have glanced but hastily at a very few of the problems which confront a horticulturist. The field, however, is limitless.

**Central Illinois Horticultural Society** held its annual meeting at Carthage, Ill., December 19 last. The program was enlivened with discussions of the following papers: "Why We Cultivate," by H. L. Dean, of Jacksonville, Ill.; "Advancement in Horticulture During the Year," by Prof. J. C. Whiten, Columbia, Mo. A revision was made of the fruit list for central Illinois. The following officers for the ensuing year were elected: H. H. Augustine, Normal, Ill., president; C. G. Winn, Griggsville, Ill., first vice-president; Sam'l Black, Clayton, Ill., second vice-president; H. L. Doan, Jacksonville, Ill., secretary; J. T. Johnson, treasurer. The time and place of the next meeting is to be decided on later.

**Bright Prospects.**—In a lecture on "Obstacles to Successful Farming, and How to Overcome Them," the Hon. William Sessions, secretary of the Massachusetts State Board of Agriculture, said: "Prices of farm produce now average low, because the production of staple products has been carried on to such an extent as to cause the supply to be beyond the demand. Labor saving machines, that have enabled a man to do the work of a number, have in a great measure brought about this state of things. The production of the population that uses farm products is now increasing faster than farmers, and whereas a few years ago it was 5 per cent. it has risen to 50 per cent., and the outlook at present is that soon the demand will be such as to increase prices, and then the farmer will be better remunerated for his labor. But these non-producers are not to be satisfied with inferior products, but they want the best, and the man who can supply that class with what is wanted, and when wanted, will be sure to obtain prices that will make his work successful."

**The American Fertilizer.**—The 1897 issue of the Manual of the Bradley Fertilizer Co., is to hand. It is a tastily gotten up book, and has photo representations of what the well known fertilizers do. There is also an article on the Army Worm.

**Peanuts.**—The Farmers' Bulletin, on the cultivation of Peanuts, which was issued by the U. S. Dept. of Agriculture, has been reprinted, and may be had on application.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### Squashes as Climbers.

In a foreign print, under the heading of "Gourds for Ornaments," we find recommended the Ohio Squash, and "another equally good American type," the Hubbard Squash. This seems wholly funny to us on this side, especially when we find our prosaic culinary Hubbard referred to as "well adapted for covering buildings." But our amusement changes to amazement when in the same category appears a certain mammoth, which often weighs over a hundred pounds when well grown. We find, however, from the same article, that when trained up a building, the growth requires support. It is a little known fact that some of the gourds have most beautiful crimped blooms—blooms which, it may be ventured, not one person in fifty could give a name to, if shown them without the accompanying foliage. A bowl filled with palest canary-colored crimped and fluted blooms of good substance might well ornament the most aristocratic of dining tables.

### The Minorca for Suburbanites.

The secretary of the London (Eng.) Minorca Club is evidently the right man in the right place, because he believes in the Minorca with a full-hearted belief, and is ready to give his reason, therefore. For the suburbanite, he thinks this fowl peculiarly well fitted, because, as he says, "the Minorca hen is the most silent of her kind." From a purely practical point of view he considers the Minorca unequalled. The waste he affirms to be the least in proportion to weight of carcass when dressed; the weight of eggs per year is probably the greatest given by any breed, and the breed is to be strongly recommended to those who want eggs in autumn when eggs are scarce. This is the testimony of a man who states himself to have had experience with nearly all breeds. It would seem that the black variety was the one he had most in mind, since he refers to it as the fowl par excellence for town fanciers possessed of small runs, on account of its color. In close quarters light plumaged fowls became unsightly through soiling.

### Care of Roosting Platforms.

No poultry raiser of any consideration will in these days build a roost without its accompanying platform for the droppings. Among the things that may be purchased, lime and land plaster hold the first place in ordinary recommendation, as an absorbent and purifier for these boards. Cheaper and, in the opinion of many, quite as good, are sand, loam, and coal ashes. The last may be used just as dumped from the stove. They are not quite so easy to remove in this form, but as it means less work otherwise thus to use them, clean platforms may be more of a certainty than when some other absorbents are used. Clean, dry loam, when at hand, can hardly be bettered. Personally, we prefer either it or coal ashes to lime and plaster, even though the latter were not more expensive.

### Location as a Factor in Success.

A very large—too large—proportion of men live where their fathers lived. Be it plot or farm, if in a bad location, it is well worth while to do some figuring to see if a change would not be for the better. A good market is the keynote to success. The best of work may often prove valueless, if the products of it are unsalable. Select a good location.

## A Lost Voice.

Advertising will do a great many things, but it won't bring about the return of a lost voice. The best thing to do is to begin, at once, the use of the sovereign cure for all affections of the throat and lungs—Bronchitis, Asthma, Croup, Whooping Cough, etc. It has a reputation of fifty years of cures, and is known the world over as

**AYER'S  
Cherry Pectoral.**

### The Value of Cleanliness.

When all things are locked in ice, the neglect of the poultry house for a few days is scarcely noticed. But as the thaw comes, ah! our nostrils! What an offense those platforms left for a day uncleaned. At such time we are not so loth to agree with the authority who asserts that the fumes from filthy platforms may cause a greater drop in number of eggs than can be made up by the entire value of the droppings. Ammonia as steady diet cannot be recommended as an egg food.

HAVE you a garden? Do you know the best varieties of everything to plant in it? The best gardeners in the world are giving their experience every week in *The Rural New Yorker*. Is not their experience worth \$1 a year to you? We can send it and AMERICAN GARDENING both one year for \$1.80, and your money back for *The Rural*, if you want it.

**GAME COCKERS?** Send 50 cts. for a monthly journal devoted to Game fowls. Sample 5 cts. **GAME FANCIERS JOURNAL**, Battle Creek, Mich.

### MONITOR-INCUBATOR

Illustrated Catalogue for stamp. Medal and Diploma Awarded at the World's Fair. A. F. WILLIAMS, 76 Race St. Bristol, Ct.

### BETTER THAN A DAIRY FARM

is a poultry farm. More money and less labor and expense. All proofs in our NEW POULTRY GUIDE FOR 1897, 100 pages printed in colors sent for 15 cents. Address JOHN BAUSCHER, Jr. Box 28, Freeport, Nl.

### HATCH Chickens BY STEAM

With the MODEL

### EXCELSIOR Incubator

Simple, Perfect, Self-Regulating. Thousands in successful operation. Lowest priced first-class hatchery made. GEO. H. STANLEY, 114 to 122 N. 6th St. Quincy, Ill.

## THE JOY OF SUCCESS

is sure to follow the use of the New Successful Incubator. Its just like making any other sure and good investment. Regulates its heating to a nicety; needs no watching; generates its own moisture. Hatches every egg that can be hatched. Sold under a positive guaranty. All about it in Book on Incubation and Poultry. Sent for 6c in stamps. Address DEER MOINES INCUBATOR CO., Box 22, DEER MOINES, IA.

### INCUBATORS

The OLENTANGY Incubator has proved to be the best. Have taken prize after prize. Brooders only \$5.00. Before buying elsewhere, send for free description and testimonials. Also breeder of 40 varieties of high-class poultry. 110 yards. 110 houses. Address G. S. SINGER, Cardington, O.

When writing to advertisers please mention AMERICAN GARDENING.

## N. Y. Wholesale Market Reports.

Business in hothouse and fancy stocks of all kinds is at a very low ebb; flowers of all kinds, whether in first or low grades, are selling more cheaply than ever before known. This may be some consolation to growers of hothouse vegetables, fruits, etc., although a poor one. It is very apparent that the pulse of the market in all divisions beats in unison so far as regards fancy stock, while the methods of distribution in each branch may differ widely.

Prices differ but slightly from those quoted last week, except that they are less firm.

Hothouse lettuce has been seriously interfered with by influx of Florida stock; dealers are wishing for a good freeze in that section.

Mushrooms are still in oversupply, and very low prices prevail even on high-class goods.

Cucumbers are in fair demand at from 75c. to \$1.50 per dozen. A few have realized \$1.75 per dozen.

Tomatoes, when in good condition and color move fairly well, but much of the stock is not up to standard.

Radishes moved freely at \$3 per 100 bunches.

The demand for hothouse strawberries shows a little improvement with prices stationary at \$4.50 per quart, for No. 1 grade.

Shipments of European grapes, light; Belgians seem to lack color, apparently the English grown article is the best taking it all round.

**Apples.**

Tomatoes, Southern Florida, per carrier 1 50—3 50

**Some Facts About an Incubator.**—The Improved Monitor Incubator is a thoroughly and honestly built machine. The heat regulator is accurate, and obviates all necessity of watching the incubator. A. F. Williams, of Bristol, Conn., the manufacturer, will mail a large book of valuable information for poultry raisers, to any one who will cut out and send him the advertisement of the Monitor Incubator that appears in this issue.

**Columbia Calendar for 1897.**—The twelfth annual issue of the Columbia Pad Calendar has made its appearance. Among the topics treated are bicycling, outdoor life, and good roads. The cycling fraternity, to say nothing of the general public, has acquired a decidedly friendly feeling for the Columbia Calendar, and its annual advent is always looked forward to with interest and pleasure. One feature of the calendar is its neat stand, so arranged that the block can either be used upon the desk or hung upon the wall. The calendar can be obtained for five two-cent stamps by addressing the Calendar Department of the Pope Manufacturing Company at Hartford, Conn.

**IN THE COUNTRY HOME**

you need constantly on hand a safe, sure and effectual remedy for the ordinary ills of life; one which will meet the requirements of all emergency cases and work a permanent cure.

**Sarsaparilla**

has done this for many years on four continents.

**CURES:...**  
Bright's Disease,  
Urinary Troubles,  
Female Complaints,  
General Debility,  
Malaria,  
and all diseases arising from disordered Kidneys and Liver.  
Ever ready to hand.  
Large bottle or new style smaller bottle at your nearest store. Be honest with yourself and try a bottle.

F. R. PIERSON CO., Tarrytown-on-Hudson, N. Y.

We have the largest and finest Collection of **PALMS, ORCHIDS, FERNS** and **FOLIAGE PLANTS** for Conservatories, Hardy Herbaceous Plants, Flowering, Shade and Ornamental Trees, Vines. Everything for a private place. Estimates and Plans for Planting Places and furnishing stock (free).

**SIEBRECHT & SON'S,**  
Rose Hill Nurseries, New Rochelle, N. Y.

## NEW CREATIONS IN FLOWERS.

If you want to know about them send 10 cts. for Mrs. Theodosia B. Shepherd's New Catalogue of Rare and Beautiful Flowers.

Many New Begonias, New Cosmos, Rare Cacti, etc., not offered by others.  
Ventura-by-the-Sea, - California.

When answering advertisements please mention American Gardening.

FOR \$4 we will send *Leslie's Weekly* (formerly *Frank Leslie's Illustrated Weekly*) and *AMERICAN GARDENING* to any address, one year. *Leslie's* is one of the most attractive of New York's numerous illustrated weeklies, and its subscription price alone is \$4 a year; therefore, it will be seen that our offer is a very liberal one. Address your orders to *AMERICAN GARDENING*. Sample copies of *Leslie's* on application.

**ONE YEAR FOR 10 CENTS**  
We send our monthly 16-page, 40 col. paper devoted to Stories, Home Decorations, Fashions, Household, Orchard, Garden, Floriculture, Poultry, etc., one for 10 cents, if you send the name and address of six friends.  
WOMAN'S FARM JOURNAL, 4815 Evans Ave., Saint Louis, Mo.

**POULTRY BREEDERS!** Send 50 cts. for a 20-paged monthly devoted to Poultry, etc. Sample 6 cts. **MICHIGAN POULTRY BREEDER**, Battle Creek, Mich.

## The American Kitchen Magazine

A magazine for every up-to-date housekeeper. The suggestions contained in a single number are worth more than a year's subscription. Price, \$1.00 a year. Sample copies free. **SPECIAL.**—We will send *AMERICAN GARDENING* and *AMERICAN KITCHEN MAGAZINE*, both one year, to any address, for \$1.50.

**AMERICAN GARDENING, P.O. Box 1697, N.Y.**

## AMERICAN GARDENING AND THE OHIO FARMER,

Both One Year Each for only \$1.60.

**THE OHIO FARMER** is a large, 20 page weekly, 41 per year. A National Farm, Stock and Home Journal, and is clearly the Leader of the Agricultural Press of America. It pays more for illustrations, Correspondence and Market Reports than any other of its class. It is the Best and Costs no more than others. Send for a **SAMPLE COPY** to **THE OHIO FARMER**, Cleveland, O.

**THE OHIO FARMER** will start their paper the date the order is received by them, and continue to Jan. 1898—14 months, if ordered at once. Address all orders to **AMERICAN GARDENING, P. O. Box 1697, New York.**

## PALACE CAR OR HAND CAR.

If you were going on a journey and the P. W. W. F. Co., offered you a reasonable rate over their "Coiled Spring Route," splendid service, safety guaranteed—would you take it? Or, to save expense, would you "pump" yourself over the road on a hand car? If you choose the latter, be sure the hand car has the right of way.

**PAGE WOVEN WIRE FENCE CO., Adrian Mich.**

Richard Branson, Market Gardener, Syracuse, N. Y.

**GLADIOLI, CANNAS, OLIVIAS,** Souchet and Lemoine's novelties first offered in America. Special tested selections at European prices. Extra mixtures: Ingleside Hybrids, Dr. Van Fleet's choice collection, Burbank's California Select, Mt. Vernon Hybrids, Groff's Hybridized Seed and Seedlings, Cannas, Italica, Austria and best standards. New Hybrid Canna. Canna Seed. H. H. Groff, Simcoe, Ontario, Canada.

## Colorado Springs, Col.

### HANDSOME GREENHOUSE FOR SALE.

Situated in the center of the city of Colorado Springs, where the climate is adapted to the growing of all species of flowers. Land 100 by 150, with 12,000 square feet of glass; steam-heat, electric light, first-class boiler and machinery, thoroughly equipped and in running order. The most complete establishment of the kind west of the Mississippi River.

Price, \$30,000.

Address Messrs. **VARNUM and HARRISON,** Counselors-at-law, 62 William Street, New York City.

## PRIVATE GARDENERS.

### Appointment.

P. E. Franken has been engaged to take charge of the gardens, etc., of C. W. Hyde, Greenwich, Conn.

### American Horticultural Society.

This is the new title which has been bestowed upon the recently formed "American Gardeners' Society." The Executive Committee of that body recommended the change of name, and at a meeting of delegates from outside societies called by the secretary of the National Society, held in the Mott Memorial Hall, New York City, on Monday last, Jan. 11, the new title was unanimously adopted. President J. M. Hunter occupied the chair at the meeting referred to, and stated its objects. He pointed out the need of such a society in America and the elevating influence it would exert on the cause of horticulture generally; he addressed himself more particularly to the gardeners, who, he said, "had made but a sad mark in the world up to date," and urged them to assert their rightful position. The gardener was "the pulpit of the horticultural world." He charged the horticultural press with not having rendered that assistance to the endeavor to form a national society to which it was entitled. In his closing remarks he asked those interested to set aside petty jealousy and guard against self-aggrandizement in the carrying on of the work of the newly formed society.

The time of the meeting, which lasted over three hours, was taken up by a discussion of the constitution and bylaws, in which delegates from Pittsfield, Mass.; Monroe County, N. J.; Monmouth County, N. J.; Dutchess County, N. Y.; Westchester County and Floricultural Society of New Jersey, took part. About sixty persons were present.

The preamble sets forth the objects of the society as follows: "To provide a more perfect organization for the advancement of all branches of horticulture, to establish a national bureau of information and registration in all horticultural matters, to promote the interest of its members individually and collectively."

All interested in horticulture are eligible to membership.

The affiliation of auxiliary societies shall be by delegate. Each auxiliary shall be entitled to elect one delegate to every twelve members in good standing, and shall pay to the national treasurer an annual fee of \$5 for each delegate.

It shall be the duty of the National Board to furnish the auxiliaries, whenever possible, with lecturers and essayists and otherwise assist in disseminating useful information in horticultural matters, any reasonable cost to be borne by the society before which the essay is read.

The secretary shall keep a directory of all gardeners and an employment registry, whereby members may be able to procure assistants, and patrons and others provided with capable gardeners, and also conduct a bureau of information for the use of members of the society.

The national officers and Executive Board shall be elected by ballot at the annual meeting in November of each year.

The society shall hold an annual exhibition and public convention for the purpose of discussing and creating a greater interest in American horticulture, to which all members of auxiliaries of the society shall be invited.

The life membership fee was fixed at \$50. After adjournment the delegates attended the "smoker" tendered them by the New York Florists' Club, which was thoroughly enjoyed.

The official delegates from other societies were: J. G. McArthur, representing the Berkshire County Gardeners and Florists' Club, Pittsfield, Mass.; A. Herrington, Morris County Gardeners' and Florists' Club, Madison, N. J.; N. Butterbach and G. A. Steele, Monmouth County Horticultural Society, Oceanic, N. J.; Peter Duff, New Jersey Horticultural Society, Orange, N. J.; W. Gomersall, Dutchess County Horticultural Society, Poughkeepsie, N. Y.; A. L. Marshall and H. Spavins, Westchester County Horticultural Society, Mount Kisco, N. Y.; J. M. Hunter, Hempstead (L. I.) Gardeners' Club.

Other persons present included: J. I. Donlan, secretary, New York; John Shore, Harrison, N. Y.; A. A. Taaffe, Irvington, N. Y.; G. H. Hale, Bellport, L. I.; W. Duckham, Madison, N. J.; Joseph Manda, South Orange, N. J.; F. L. Atkins, Short Hills, N. J.; T. Harvey, Stamford, Conn.; Wellington Kennedy, Red Bank, N. J.; Herman Stays, Little Silver, N. J.; James Dowlen, Seabright, N. J.; Robert Millican, Seabright, N. J.; Max Richter, Port Richmond, S. I.; R. Grigg, Coldspring, N. Y.; A. J. Manda, New York; H. Cotterell, Tarrytown, N. Y.; R. Richtes, Irvington, N. Y.; W. Anderson, Mamaroneck, N. Y.; Peter McDonald, New York; C. H. Atkins, Madison, N. Y.; E. J. Brown, 378 Forty-sixth street, Brooklyn, N. Y.; R. Jenkins, Jr., Rye, N. Y.; W. H. Harvey, Port Chester, N. Y.; A. Grierson, Rye, N. Y.; C. Elliott, 54 Day street, New York; R. Wright, Newport, R. I.; G. Caton, Tarrytown, N. Y.; T. Harrison, Rhinecliff, N. Y.; J. R. Fotheringham, Tarrytown, N. Y.; A. L. Don, New York; W. Bartholomae, Kings Bridge, N. Y.; W. G. Sage, Kings Bridge, N. Y.; Owen G. Owen, Monroe, N. Y.; J. H. Troy, New York; J. Fursie, Yonkers, N. Y.; C. W. Ward, Queens, L. I.; C. Webber, New York; R. Angus, Tarrytown, N. Y.; R. Brett, Yonkers, N. Y.; R. MoInnes, Montclair, N. J.; A. Wengert, Bay Ridge, N. Y., and C. Weising, Brooklyn, N. Y.

### New York Gardeners' Society.

A very largely attended meeting was held on Monday last after the convention of the National Society. The essayist of the evening was Mr. W. Scott, Tarrytown, N. Y., who read a paper upon grape growing under glass. This proved to be a most valuable and practical treatise upon the whole subject, which was cleverly and skillfully handled by the lecturer. This paper will be published in full in next issue.

Considerable discussion followed, being taken part in by Messrs. Herrington, Shore, Hunter, Withers and Marshall. The points brought out were: It is possible to move established vines; preference should be given to inside and outside borders; don't make borders too deep, three feet six inches should be the extreme; leaves on young vines, ripening up too quickly are induced by excessive potash in the soil, too much bone meal and inability to take care of the sap flow; Gros Colmar grapes improve by keeping; there is no need to syringe vines after the bunches are set, sufficient moisture can be supplied by damp floors, etc.; give side ventilation in May, make the borders all at one time.

### Oceanic, N. J.

The regular meeting of the Monmouth County Horticultural Society was held on Friday, Jan. 8. The most important business of the evening was the election of delegates to attend the convention of American gardeners. The delegates chosen were as follows: Robert Millican, Seabright; James Dowlen, Rumson Road; G. A. Steele, Little Silver, and Wellington Kennedy, Red Bank. The president, Mr. Butterbach, read a paper on "Propagating Carnations from Cuttings."

### Poughkeepsie, N. Y.

The annual meeting of the Dutchess County Horticultural Society was held Jan. 6. The following are the officers elected for the ensuing year: President, Mr. George Salford; vice-president, Herman Asher; treasurer, James Sloan; secretary, Wallace G. Gomersall; assistant secretary, William Salford. Sixteen new members were elected, making an addition for the year of forty-seven. The number of members on the roll is now ninety-nine. The treasurer's report showed a good credit balance. During the year a beautiful inlaid gavel and marble slab was presented to the society by Mr. John C. Galvin. The secretary's report showed the chrysanthemum exhibition had been most successful. There were 157 exhibits staged for competition, besides a number of splendid exhibits for exhibition only. It was suggested that more classes should be made for private gardeners; that a challenge trophy should be offered for competition among regularly constituted societies, to be the property of the

society winning it three times in succession; also that where chrysanthemums were exhibited six to one vase, that ferns and foliage be used in arranging the blooms. The vases of twenty-five blooms, arranged for effect with foliage, was considered the most attractive exhibit in the last exhibition. It was suggested that a private gardeners' class, as well as open class, be made of this exhibit.

### Mount Kisco, N. Y.

A number of florists and gardeners met at Odd Fellows' Hall on Tuesday, Jan. 6, for the purpose of organizing a gardeners' society. Judge J. H. Crane occupied the chair and J. I. Donlan acted as secretary pro tem. After considerable discussion it was decided to establish a horticultural society in preference to a close gardeners' club. The title chosen was the Westchester County Horticultural Society. The question of by-laws was gone into, and after reading over those governing the Dutchess County Horticultural Society they were found to practically meet the requirements of the new association, and were adopted with slight changes. The meetings will be held every fourth Friday. Permanent officers were elected to serve for one year, as follows: President, A. L. Marshall, gardener to Mr. J. B. Dutcher, Pawling, N. Y.; vice-president, W. Stevenson, gardener to Mr. J. D. Layng, Mount Kisco; treasurer, M. J. Green, gardener to the Hon. James Wood; secretary, H. Spavins, florist, Mount Kisco. Three honorary presidents were elected, the Hon. James Wood, Dr. Curry and Mr. T. Ellwood Carpenter.

### Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

E. M. COLE, Pella, Iowa.—Garden Annual for 1897, list of flower and vegetable seeds, novelties, etc.

T. J. DWYER, Cornwall, N. Y.—Strawberries, other berries and small fruits, and fruit trees specially; also seeds and shrubs.

D. LANDRETH & SONS, Philadelphia, Pa.—This is the 113th annual issue of the seed list. General list of flower and vegetable seeds, with photo illustrations of various varieties of vegetables on one plate.

ALFRED BRIDGEMAN, 37 East Nineteenth st., New York City, N. Y.—Vegetable and flower seeds, implements, etc.

GOULD NURSERY, Beaver Dam, Wis.—Concise descriptive list of fruits, plants, bulbs, seeds, implements, etc., for the garden or farm. Has hints on transplanting.

A. MCINNIS, 383 and 383½ Talbot st., London, Ont.—A general list of garden and agricultural seeds, flower seeds, plants, seed grain, and potatoes. Offers for a melon premium competition a watch to the guesser of the number of seeds the melon has.

M. J. HENRY, 604 Westminster Road, Vancouver, B. C.—A very comprehensive classified list of plants for various purposes, including street and shade trees, herbs, vegetable plants, Roses, and general stock; also Bees and Bee-hives.

THEO. KOSS, 261 Reed st., Milwaukee, Wis.—Seed Catalogue in German and English; general garden supplies and tools, etc.

WM. A. OLDS, Okemos, Mich.—Price list of berry and vegetable plants, seed potatoes and seeds.

BATEMAN MFG. CO., Grenloch, N. J.—The annual list of the celebrated Iron Age farm and garden implements will be of interest to any who are engaged in soil cultivation. The immense advance in labor saving machinery is easily realized by a perusal of this well illustrated and handsome list. The light tools for small gardens are the latest and welcome advance.

KIM & BURPEE MFG. CO., Syracuse, N. Y.—Has some illustrated catalogue of manure spreaders. This machine is being used more now by market gardeners with whom a saving in both time and labor is an important consideration. It delivers the manure evenly and in excellent condition for fertilizing the crops. It is a mistake to suppose that this spreader can only be used to advantage on large farms. It is equally valuable to the truck farmer, market gardener, or fruit grower. It handles either manure or ashes equally well.

In digestion is the ingratitude of a pampered stomach, and the consequences of it go beyond the stomach. They are found in torpidity and congestion of the liver, in weakness and inefficiency of the kidneys. You cannot hope to be well while your blood is thick with dead matter. Cleanse and invigorate yourself with Warner's Safe Cure.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\* \* \* We cannot undertake to reply by mail.

### Starting Begonia Tubers.

[Will you kindly inform me how to treat tuberous Begonias. The tubers came from Germany about six weeks ago. I planted them in 6-inch pots, using light loam, one-third fine rotted manure, and covered them 1 inch. They were placed in the greenhouse with a temperature of 55° to 60° at night.—W. G., West Park, N. Y.]

—Great care must be exercised in watering; by keeping the plants on the dry side till they are well established they may pull through. A better plan would have been to have put the tubers into the smallest sized pot possible in light soil, potting on when required; or, perhaps, even better still, to have placed them in very shallow boxes, and just sprinkled them over with light soil or leaf mold.

### Violet Treatment.

[I have about 200 Violets in a cold frame; the soil used is sandy loam, sod, and rotted manure; spotted leaves have always been picked off. The plants look healthy, but have small leaves, and, though they show buds, do not make any flowers. If I put some sheep manure in a barrel, put water over it, and water the plants with this once or twice, will it help any?—J. G., West Park, N. Y.]

—With longer and brighter days the leaves will soon develop, and at the same time the flower buds. Caution is necessary in watering at this early season, and should only be

done if the soil be really dry. Should it be decided to give water, choose a very bright morning for the work. Later on a little sheep manure water may be applied.

### Greenhouse Management.

[I have charge of a small greenhouse in which I have Carnations and Violets. The boiler is at the east end of the house, and on both sides, about half way up the beds, the Violets die off, and then shoot up again, and on the other half, or western end, they are nice and healthy. Would be pleased to know the cause of this.—George L. S. Buck.]

—In the absence of further details, we surmise that the boiler keeps the one end too warm and that as a consequence the soil has been drying up too rapidly.

### Cocoanut for Seed.

(To J. W. B.)—We have had but very little to do with cocoanuts as seed. The nuts offered for sale by the fruiterer are not possessed of germinating power. All nuts that have grown have been with the outer husk still attached.

### Begonias from Seed.

[What is the best way of raising Tuberous Begonias from seed?—F. A. J., Brookline, Mass.]

—Seed should be sown at once. The best receptacles for the seed are square earthenware pans, ordinary flower pots, and even very shallow boxes will do when pans are not obtainable. Get ready a good supply of broken crocks, bricks or ballast, being careful that all dust is removed; half fill the pans with this, having the pans, or whatever be used, not more than two inches deep. Use a compost made up principally of leaf-soil, old, sweet and flaky, a little loam, plenty of coarse-grained sand, and one part of crushed charcoal. Mix

# Mother and Son.

## Both Sorely Afflicted, but Relief is Found in Dr. Williams' Pink Pills for Pale People.

From the Call, Lafayette, Ind.

The Call has known the Byers family, of Talbot, Ind., for a long time, and J. W. Byers is one of those deliberate men who say little, but read and observe much. Mr. Byers has been suffering for the past three years with grip and kindred troubles. His mother has ever been a sufferer, resulting later in the most aggravating form of rheumatism. Some time ago Mr. Byers was persuaded by a neighbor to try Dr. Williams' Pink Pills. It didn't take long to set Mr. Byers to talking about this remedy, and the Call sent a special representative to his home to ascertain the exact facts. The subjoined sworn statement of Mr. Byers is sufficient. It tells the facts simply and briefly:

"I know positively that I was cured by Dr. Williams' Pink Pills. I was persuaded by one of my neighbors, Maxen Williams, to try them, as he claimed to have been cured by them. I had the grip three times, and was taken down with rheumatism, and did not expect to live. The doctors said I would never get well. They advised me to take a change of climate. I was reduced from one hundred and thirty-five to one hundred and five pounds. As soon as I began taking the Dr. Williams' Pink Pills I began to gain strength and the use of my limbs was restored. I had been almost helpless for two years, the stiffness in my limbs had been painful in the extreme. But with the use of the pills the pain ceased, and now I am as limber and as active as when a boy.

"I was also troubled a great deal with my kidneys, but the ailment has entirely disappeared. I have been a subject for the doctors for a long time. Two reputable physicians had treated me for months, and I had spent a large amount of money for patent medi-

cines, but to no avail. As I said, I finally took Dr. Williams' Pink Pills for Pale People and here I am well. I believe that is the most wonderful remedy ever made. I need not extol this remedy, for all my neighbors know what my condition was and what cured me. They will all tell you that it was Dr. Williams' Pink Pills.

"My mother, who is seventy years old, was also troubled with rheumatism and could scarcely move. She was very wakeful at night and had no appetite. She took five boxes of Dr. Williams' Pink Pills, and now she is in perfect health, and does all her own work on a farm.

(Signed) "J. W. BYERS."

Subscribed and sworn to before me this 10th day of August, 1896.

JAMES GOODWIN, Notary Public.

Dr. Williams' Pink Pills for Pale People are considered an unfailing specific for such diseases as locomotor ataxia, partial paralysis, St. Vitus' dance, sciatica, neuralgia, rheumatism, nervous headache, the after effects of la grippe, palpitation of the heart, pale and sallow complexions, that tired feeling resulting from nervous prostration; all diseases resulting from vitiated humors in the blood, such as scrofula, chronic erysipelas, etc. They are also a specific for troubles peculiar to females, such as suppressions, irregularities, and all forms of weakness. In men they affect a radical cure in all cases arising from mental worry, overwork, or excesses of whatever nature. Dr. Williams' Pink Pills are sold by all dealers, or will be sent post-paid on receipt of price, 50 cents a box or six boxes for \$2.50 (they are never sold in bulk or by the doz.), by addressing Dr. Williams' Medicine Co., Schenectady, N. Y.

# AMERICAN GARDENING CLUB LIST.

LET US FILL YOUR ORDERS FOR 1897.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

ADDRESS  
CASH WITH ORDER.

AMERICAN GARDENING, P. O. Box 1897, NEW YORK.

well together but don't screen it, merely picking out by hand any bits of sticks, lumps or stones. Press evenly in the pans, leaving room for half an inch of prepared soil for seed bed. For this purpose use good decayed leaf-soil; sieve it very fine (if no sieve be fine enough, use mosquito netting); mix with a sixth of clean sand, silver sand being preferable. It will be necessary to dry the soil first to get it to go through so fine a mesh; some growers burn their leaf-soil first; that is good in its way, as it also kills insects and fungi.

Fill the pans up to a quarter inch of top, making the surface perfectly smooth. Now make sure that the whole is properly moistened through. To do this, it is best to hold the pan partly submerged in a tub of water, until the whole is soaked through; this will prevent breaking the surface, and it is sometimes difficult to get a watering pot with a rose fine enough. After a thorough soaking, wait half an hour or so until surplus water is drained away, then sow the seed. The seed being so small, it is best to use very smooth white paper in the work, placing the seed on the paper and then scattering it evenly over the prepared surface. In order to secure the seed in its place, it is well to sprinkle the smallest possible quantity of the fine soil over it, but not by any means burying the seed.

Now set the pans in some kind of plunging material, covering nearly up to the rim. Plunging material must have no heat in itself; cocoanut fibre, if obtainable, would be best. Cover with sheets of glass, then with sheets of paper, to exclude the sun and strong light. Care must be taken that the glass does not lie too close, otherwise there is considerable danger of damp or fungous growth. Wipe the glass dry every day. In ten to fourteen days the seedlings should appear, when the paper must be removed, except when the sun is shining.

A steady bottom heat of from 65° to 70° should be maintained, and the general temperature of the house about 70°, never below 60°. The house should be kept moderately moist, but avoid hot water tanks under the seed pans. Plain pipes are best, with some kind of plunging material over them kept moist.

The main thing after germination is to keep the soil regularly moist, for if at any time it become dry, the seedlings will drop off wholesale; instead of overhead watering, dip the pans in water heated to the temperature of the house. The pans should be dipped to within an inch of the rim, holding them in water till the whole contents are soaked through. Keep the tops comparatively dry, and avoid wetting the foliage at this stage of growth. Gradually inure the seedlings to the light, and keep the atmosphere of the house on the move. In very fine weather, open the ventilators slightly, as to change the air, care being taken to prevent cold winds from striking the seedlings.

As soon as the leaf is formed, prick out into pans, filled with exactly the same compost as for seed sowing. When the soil is right, make holes with a very finely pointed dibble, lift the seedlings carefully with a notched stick, and place in their new homes, pressing the soil gently around them with the dibble. The tender seedlings must not be touched with the fingers.

Begonia seed is somewhat irregular in germination. Water the newly filled pans very gently with the finest rose possible. This will settle the plants in their places. Do not water again till dryness appears. Keep the pans in conditions as prescribed for seed pans, except that more light and air will be given to encourage stronger growth.

## Cabbage Maggot.

(To G. S. Wagerman.)—The cabbage maggot is the larva of a small fly which is destructive also to allied plants, such as turnip, radish, etc. As a remedial measure, burn all infected plants, and as a preventive, pour about a teaspoonful of carbon bisulphide into a hole made underneath the root of the plant. Do not let it come into contact with the wood itself. The substance is very highly inflammable.

## Tulips Branching.

(To J. H.)—There is not anything very uncommon in a double Tulip branching, but, so far, the character is not a fixed one. It is due possibly to excessive vegetative growth, at the expense of the essential organs.

## Bees and Beekeepers' Supplies.

(To C. H. G.)—You will be able to get all the appliances for entering into the work of bee-keeping by addressing any of the firms advertising such in our pages (see page 40).

Names of Plants. — (To C. M. C.) — *Euonymus japonicus aureus variegatus*. The Golden Japanese Spindle tree; one of the most useful shrubs where it will withstand the winter; specially suitable for seaside places.

(To Dr. T. R. Clark.)—Many thanks for information furnished.

**OUR PREMIUMS ARE OFFERED** with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will) he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

## LORD PENZANCE'S NEW HYBRID SWEET BRIARS.

Quite a New Feature in Roses.

The foliage of every one of them is as sweetly scented as the old-fashioned Sweet Briar that grew in our grandmothers' gardens.

The Sweet Briar or Egiantine, is acknowledged by all to possess one of the sweetest perfumes that nature has provided and its delicious scent is the object for which it is usually cultivated. These new varieties, now for the first time placed in commerce, are vast improvements upon the old sorts. They are hybrids (obtained by the Right Hon. Lord Penzance) between the common Sweet Briar and various old-fashioned garden Roses and are possessed of many advantages.

The flowers are borne in wondrous profusion, and vary in color from white, through several shades of pink, to very dark red or crimson.

The plants are perfectly hardy even in very bleak and exposed positions.

For vigor of growth there is scarcely anything in the rose world to equal them. Plants three years old have now many shoots on them that rise to the height of twelve feet. These, with a slightly outward bend, and clothed with flowers of exquisite tints, produce a gorgeous effect.

The buds are the most graceful, sweet and delicate objects imaginable.

The flowers are single or semi-double, and this adds lightness and elegance to their beauty.

After the flowers are over, they are followed by bright scarlet seed pods or "hips" in great numbers, which, nestling among the deep green, scented foliage, make the plant delightfully ornamental till quite late in the autumn.

No garden will be esteemed complete which does not possess a group of Hybrid Sweet Briars. They are so sweetly scented, so beautiful in color, so hardy and free from disease and the attacks of insects, as to make them eagerly sought after by all the knowing ones.

**This  
is Our  
Offer.**

For one NEW subscription to American Gardening at \$1.00, we will forward you, all charges prepaid, your choice of two of the three following varieties:  
Meg Merrilies, Red.  
Anne of Geierstein, Pink.  
Brenda, Blush White.

The above to be well-established plants out of 2½ inch pots.

The collection of Three above Plants for one NEW SUBSCRIPTION to American Gardening at \$1.25.

These plants will be forwarded to our subscribers direct from the growers, eminently responsible people, who guarantee them to be true to name and color.

Plants ready for shipment May 1. Orders be placed now, however, owing to the expected enormous demand.

## OUR GREATEST 1897 PREMIUM

The Wonderful New Climbing Rose

# Yellow Rambler (Aglaia)

A worthy COMPANION to the well-known Crimson Rambler.  
The Hardest Yellow Climbing Rose Ever Introduced.

**Yellow Rambler** bears its flowers in immense clusters, often as many as one hundred and fifty blossoms in a bunch, the trusses being of handsome pyramidal shape.

THE YELLOW RAMBLER AS A CLIMBER.

**Yellow Rambler** holds its blooms from three to four weeks without fading; a large bush in full bloom is one of the most beautiful sights imaginable.

**Yellow Rambler** is a clear decided yellow, in marked contrast to many roses so described, but which have really only a yellow tinge.

**Yellow Rambler** is very vigorous; well-established plants often making shoots eight to ten feet in height in a single season.

**Yellow Rambler** represents the triumph of the century in the hybridizing art, and is the most valuable introduction in recent years.

**Yellow Rambler** is very sweetly scented.

**Yellow Rambler** combines the climbing habit and decided yellow color with hardiness.

**Yellow Rambler** will withstand, without protection, a zero temperature; with protection it will thrive where any other rose will.

**Yellow Rambler** is thus adapted to successful culture in nearly all of the northern parts of the United States.

**Yellow Rambler is absolutely NEW on the market and will prove the sensation of 1897!**

**Yellow Rambler** premiums will be shipped direct to our subscribers from the introducers, one of the largest and most reliable firms of nurserymen in the country.

**All stock** is guaranteed pure and will be shipped in good condition.

**DON'T YOU WANT A YELLOW RAMBLER ROSE?**

You Can Earn One in Ten Minutes!

**READ OUR OFFER.** We will forward, all charges prepaid, one well-established plant of Yellow Rambler Rose, from 2½ inch pot, for ONE NEW SUBSCRIPTION to American Gardening at \$1.00, or six plants for five NEW subscriptions at \$1.00 each.

The same plant will not be sold in 1897 for less than 50 cents. Plants will be shipped on and after March 15th. It is expected that the demand for this New Rose will be phenomenal, and we advise those of our readers who want a plant to be early with their order.

# More Potash

in the fertilizers applied on the farm means larger and better yields of crops, permanent improvement of the soil and

# More Money

in the farmer's pocket.

All about Potash—the results of its use by actual experiment on the best farms in the United States—is told in a little book which we publish and will gladly mail free to any farmer in America who will write for it.

GERMAN KALI WORKS,  
93 Nassau St., New York.

**OLD BOOKS SEND STAMP FOR LIST.** Address  
A. J. Crawford, 518 N. 7th Street, St. Louis, Mo.

**DISCOVERED** A face wash that will remove that greasy complexion and leave it soft and white in 10 minutes after washing, and in a week remove all pimples, blackheads and tan. Bleaches the skin without irritation. Perfectly harmless; contains no poisons. Costs but five cents to prepare enough to last six months. Recipe and full directions, 25 cts. Mrs. E. HUNTER, 6812 Evans Av., St. Louis, Mo.

**TRY DREYER'S GARDEN SEEDS**

Plants, Bulbs and Requisites. They are the best at the lowest prices. Calendar for 1896 mailed free. Address

HENRY A. DREYER,  
714 Chestnut St., PHILA.

## Plants Thrive

You can almost see them grow ON **ISSEX** Flower Food.  
10 C. of your dealer will buy the package that feeds 10 plants 1 year. Or mail eight ac. stamps to  
Russell Cement Co., Gloucester, Mass.

Are You Proud of Your Garden

Our varieties of both Vegetable and Flower SEEDS are strictly 'up-to-date.' Our beautiful Garden and Farm Manual for 1897 will help your selections.

We will send it together with a packet each of our beautiful New Branching Asters and our New Sensation Lettuce, on receipt of only

10 Cts.

Our regular catalogue price of each of these exquisite novelties being 10 cents per packet.

Send at Once.

JOHNSON & STOKES, 217-19 Market St., Philadelphia, Pa.

Please mention American Gardening when answering advertisements.

## Beautiful Everblooming Roses

Grower's selection from the best varieties.

Of all premium offers this is decidedly one of the most tempting, and we fully guarantee its absolute reliability. Grower says:

"We will fill your orders with strong well-ripened plants, grown specially for the purpose, from 2 1/2 inch pots. This is our most popular collection and it has made hundreds of customers for us, as the testimonials in our possession will show." In this collection will be found such varieties as:

The Bride, Perle  
Bridesmaid  
Catherine Mermet

F. Kruger  
Prince Hohenzollern  
Flaman Cochet

Snowflake  
Maurice Rouvier  
Cornelia Cook

The collection embraces a variety of colors, each plant is distinctly labeled, and the collection will make a beautiful bed. Packed in stiff, telescoped pasteboard boxes, oil finished on inside, and shipped to any address in the U. S. in good condition.

Orders for this collection can be filled at any time, and subscribers in the North and West are advised to have their orders filled in March or later.

## Grape-Growing Under Glass.

Lecture before N. Y. Gardeners' Society by WILLIAM SCOTT.

The cultivation of indoor grapes is such an extensive subject that it is hardly possible to do it justice in a short essay. However, by confining myself to a few of the more important points, I hope to be able to give such information as may be of service to my fellows.

### Houses.

The securing of suitable houses is, of course, the first step; of the several different builds I prefer the span-roofed, as it allows of equal justice being done to the vines on both sides of the house, whereas, in the lean-to, or three-quarter-span houses, only those planted in the front can have sufficient light and air. As to the dimensions, the houses may be of any length, but I consider those of such height and width as to allow of a rod of about 14 feet in length are in every way the most convenient. The foundations should consist of arches, to allow of an outside and inside border. Much diversity of opinion exists as to the necessity or expediency of having an outside border for the earliest house. Many contend that it is better not, as then the roots are under better control; my preference is inside and outside borders for both early, and late houses.

### Borders.

The borders of the early graper that I have in charge at the present time are all

inside, and, although we gather good crops, I find that when the bunches have to hang for any length of time after being ripe shriveling takes place much sooner than it ought to do, and this is, no doubt, due to lack of moisture at the roots,

since water has to be withheld after coloring has commenced, and cannot again be given until the grapes are cut. This necessitates a long, dry season, whereas, if an outside border had been provided, the additional root space would have enabled the vines to carry their crop in good condition for a considerably longer space of time. Moreover, a border all inside must be much more easily exhausted, and, no matter how liberally manures may be applied to the surface, the soil will need renewing in about half the time it would otherwise do. Of course, it is absolutely necessary that the outside border be protected both against frost and against an oversupply of moisture; this can be done by a good covering of stable litter—just enough to give a gentle heat—covered over with shutters made to fit closely, so as to throw off the rain. This covering should, of course, be removed after the temperature has risen sufficiently high out of doors.

The borders should be excavated, so as to allow of a foot of drainage and three feet of soil. The soil will probably sink a few inches, which should be allowed for; this depth I consider amply sufficient for any graper border. In some cases it will be necessary to cement the bottom of the borders

FIG. 15.—HOT HOUSE GRAPE GROS COLMAR. (See page 54.)

and in most cases it will repay the extra outlay, as it both insures against stagnation and averts the danger of the roots getting down into the poor soil; where cementing is not done, the bottom of the border must be made as firm as possible. In either case a slope of at least six inches must be given from inside to outside of the border.

If the situation be high and dry no cementing will be needed; broken stone or brick mixed with old lime rubbish to a depth of one foot, with a drain running along the outside of the border, being all that is required. But in low-lying situations, even although the border be cemented, it may be necessary to have drains running across the border at intervals of from eight feet to ten feet, leading into a main drain, which should have sufficient fall to insure the carrying away of all surplus water. There is always a possibility of having too much of a good thing, and it is quite possible to have too much drainage. We want the borders to retain the moisture to a certain extent, but, at the same time, we must insure against stagnation.

#### Compost.

In preparing the compost for filling the borders much will depend on the quality of the sod procurable, which must constitute the main part of the compost. Both the physical properties and the chemical composition of the soil may have to be regulated. Should the soil be of a stiff, binding nature a liberal amount of charcoal and old lime rubbish must be added. If, on the other hand, the sod contains plenty of fiber and the nature of the soil be free and open, nothing but manure need be added. Light soils as a rule require more manure than do the heavier ones.

In adding the manure the main object should be to use only such as will make the compost as lasting as possible. For this purpose there is nothing better suited than half-inch bones; soft manures should always be avoided. The sod should be well chopped up and thoroughly incorporated with the other ingredients before being filled into the border. It is a bad plan to put in the sod and manure in layers. A layer of the sod, intact, green side down, should be placed over the drainage to keep it clean until the whole has settled.

#### Planting.

In regard to planting; I have always found the best results where the vines were planted in a young-growing state. The planting of two-year-old or so-called fruiting canes is undoubtedly a mistake, and when one can afford to wait the best ultimate success is insured by striking the eyes in January, growing them on and planting in the borders during the month of May. The best distance to plant is four feet apart; vines so planted will run to the top of an ordinary house the first year, and before starting again should be well cut back. In the succeeding year leave three feet of young growth, and the third year fruiting may be allowed to commence, but should in no case be overdone; two or three bunches will be a sufficient crop for vines of this age to carry.

#### Cultivation.

The general cultivation of established vines may now be considered. The time of starting into growth must, of course, be regulated according to the time the grapes are wanted. The first house, as a general rule, is started about the beginning of January, and in this latitude it is not advisable

to start much earlier. This will give ripe grapes about the last of May or the beginning of June.

In preparing for starting, the first step is pruning; in order to prevent the spurs from becoming long or unsightly they should be pruned as close as is possible without incurring danger of sacrificing the crop. One good, clear eye should always be left, and in the case of shy fruiting varieties it is safer to leave two.

Cleanliness is absolutely necessary to the successful production of good grapes; first have the woodwork, iron-work or brickwork well washed, or painted if necessary, but painting will not be required nearly so often provided the houses be kept clean by washing. Every corner and crevice must be gone into, to make sure that there are no insects or insect eggs left. Strong cleansing solutions need not be used, as they invariably injure the paint. Warm water, with soap and plenty of elbow grease, will do the work most satisfactorily.

In cleaning the rods themselves much will depend on the state they are in; the old custom of scraping the vines is undoubtedly a mistake and should never be done if it can possibly be avoided, but where meaty bug or red spider has got a hold there is no other way of getting clear of it. It will then be necessary to remove enough of the loose bark to get the pest rooted out, then thoroughly wash the rods with some insecticide, to kill any insects that may have been left. There are a number of different washes that may be used, but I have found the old English preparation, Gishurst Compound, one of the safest and most reliable; this is dissolved in warm water and applied with a paint brush (being made just strong enough so as to raise a lather when applied). To insure against all insects it will be well to remove about one-half inch of surface soil inside, replacing by fresh material.

It is a very general custom to tie down the rods when starting them, presumably to get them to break more evenly, and those practicing this custom will put forward numerous advantages to be gained by it, but I am inclined to think it is done more by force of habit than anything else. I never tie down my rods, but fasten them up in their places at once, and I find that I have always as even a break as any of my neighbors, and then there is no danger of my breaking the shoots by handling the rods after they have started.

If the borders are old a liberal application of artificial or farmyard manure had better be given and lightly forked in before the fresh soil just referred to is put on; then the whole should have a good watering. If the chill can be taken from the water, so much the better. The sprinkling of the rods with tepid water and the maintenance of a moist atmosphere are two of the most important factors toward the procuring a free start.

(To be continued.)

**Treatment of Strawberries.**—There are several methods of using commercial fertilizers for strawberries. Probably one of the best was used by J. G. Harrison & Sons, of Berlin, Md., the past season, a mixture of 15 tons to a 30-acre field of spring set plants, broadcast at two applications, 2 tons potash, 1½ tons nitrate soda, 7½ tons rock, and 4 tons of tunbrage, which gives them ten millions of fine plants to offer to their trade. The land was fresh cleared, some never in any other crop before. There are over 60 varieties.

## Growing Grapes from Cuttings.

If possible, I prefer to take cuttings from young vines from two to six years old, but if from a vineyard, a number of years older, and the vines have always been healthy and vigorous, and now have a strong growth of wood, I consider it perfectly safe to use them. Cut early in the fall, or very soon after the vines become dormant, but the work can be done up to the last of February, and a large percentage of cuttings will grow.

#### Size and Length.

With regard to size, I do not like to bother with any much smaller than a common lead pencil, unless of some choice variety, of which the wood is scarce. Those of a uniform length are to be desired. When some varieties have shorter joints than others, I would cut, as shown in the accompanying sketch, at A, with three buds; but if of varieties like Concord or Worden, I prefer a cutting like at B, and measuring about 7 to 10 inches from top to lower bud. The oblique marks in the illustrations indicate place where the cut is made below the lower bud. Possibly some one may

FIG. 16.—GRAPE CUTTINGS.

think a little closer would be better, but we have met with success this way.

#### Two or Three Buds, Which?

The plant at C is grown from the two-bud cutting (B), and is of much more convenient form to set than the one raised from the three-bud cutting, and as the roots can be spread out in every direction, and at an even depth, the plant is generally sure to grow. The objection to the three-bud cutting is there is an upper layer of roots, which do not seem to be of any particular use, but are in the way while the soil is being worked around the lower layer of roots. After making the cuttings as explained above, we get a small pile of them ready, and putting the lower buds all one way, tie them up in bundles of one hundred each, using willow or wire. Both top and bottom of the bunch is tied, to prevent any shifting around, and consequent injury to the buds while handling.

#### Storing.

If there be no cellar or pit in which to conveniently place the prepared bundles of cuttings, a trench can be dug large enough to take in all the

bundles, which should be placed with the lower ends of the cuttings up. Put in all the bundles snugly together, seeing to it that they are so arranged that the bundles will all be on a level; scatter fine sand in the spaces around the bundles, then throw two or three inches of the same evenly over the cuttings; finally fill in and "ridge" the top of the trench, to carry off water during rains.

Care should be taken to dig your trench where it is high and dry, allowing good drainage.

To make all the more secure, it is a good plan to put a heavy covering of old straw or marsh hay over the ridge of the trench. Frost must be kept out, so that the cuttings may callus thoroughly.

#### Planting.

When the cuttings are taken out for planting, be careful not to take out, and thus expose to the air, too many bunches at a time; and those that are put in the basket should immediately have damp moss placed over the butts, to protect them from sun and wind. Plow a furrow with a one-horse garden plow, plowing six to seven inches deep. The cuttings can be rapidly laid along the landside of the furrow, with the tops at a slight angle toward either end of the row. Let the upper bud come even with the surface; some growers desire to have it a little above. The cuttings can be placed in position with the left hand, while the right one turns over a good handful of soil and puts it against the cutting, to fasten it in position until the row is finished. Then turn in about one-half the furrow turned out, and thoroughly firm with the feet, packing the ground hard as possible and close up to the bottom part of the cutting, especially that soil which was thrown loosely back into the furrow. Then again go over the row, and hoe in the balance of the soil to bring it even with the surface; firm with the feet as before (some use a tamper, as in setting posts). Finish off by running the garden rake lightly where the feet packed the soil, and the setting of the cuttings is done.

#### Cultivation and Soil.

To get the best results, the rows should be cultivated at least once each week during the growing season, and every weed kept out from between the plants in the row. The crust, if soil be heavy, should also be broken between the plants. The Planet Junior, with small teeth, as used among strawberries, is the best cultivator we ever used for the purpose. Rich loam, with a clayish subsoil, with a slight mixture of sand, is to be desired. Sandy land, with a leachy subsoil, we have tried, only to find that the roots made a second class growth. I will not describe other methods, as single eye cuttings, mallet cuttings, etc., as by the methods described above as fine one year plants have been grown here this season as a person would desire to ask for, and it serves all practical purposes.

CHARLES C. NASH, Michigan.

**Mild Weather.**—There is considerable danger to all sorts of garden stock lurking in the unusually mild weather experienced in many sections this season. Growth is reacherously lured on; the buds become soft, and fall easily before a subsequent freeze. Happy, then, is the man who has properly protected his shrubs, etc., wherever has been possible. 'Tis not now too late to do the work either!

## The Complete Hotbed.

We many times use the term hotbed as if it applied generally to one and the same thing. There are hotbeds, and hotbeds. There is the illy-made and badly equipped one that disappoints the maker by being constantly cold; an experience not uncommon to the amateur. There is the poorly set up hotbed that gets out of shape as soon as the manure settles, and if the soil within the bed be not a succession of humps and hollows, the maker may be considered fortunate. There is the complete, well-made hotbed which, whether set up soon after midwinter or a month later, proves a success in its heating powers, in keeping its shape, and in yielding profitable returns to the market or other grower, large in proportion to its cost; the construction of such a hotbed is the subject of this article.

The cost of its construction is hardly above that of the cheapest bed that can be made; its superiority depends on things that are mere matters of planning and of labor at a season when labor is cheap.

#### Location.

The early hotbed is made in February in the North. The location should be one that will admit of drainage from the excavation that is made to hold the manure; to have a bed that acts as a catch basin for water in case of a heavy thaw or a rainfall, is too risky. If the bed be also sheltered by an evergreen or

time in winter, some manure may be piled around the base of each.

#### Making the Bed.

In making the bed remove the sash and the board bottom; then fill in the manure evenly, over the entire excavation, tramping it uniformly and firmly. Under the frame itself the manure is to be brought up to the top of the strips that rest on the stakes. Indeed it may be brought several inches higher, counting on the boards and the soil to press it down to its proper place. Outside the frame the manure is to be piled to make a slope from the sash to the ground level. The slope of the hotbed itself should always be towards the south—that is, the sash exposed to the sun.

In order to preserve as much heat as possible, no better means can be employed than shutters covering the manure as shown in the engraving. These are made of  $\frac{3}{4}$ -inch stuff secured with clinch nails to cross slats. They should be made of a size convenient to handle. If after the heat be somewhat spent any difficulty be found in keeping up the temperature desired, the shutters may be removed, some of the lining thrown out and fresh manure put in its place.

#### Covering the Sash.

Protection against cold must be given in the shape of sash covers. A large straw mat, which may be rolled up when not in use is a common and effective means; but some of our best gardeners prefer wooden shutters.

FIG. 17.—CROSS SECTION, END VIEW, OF HOTBED BUILT ON SUPPORTS.

other windbreak, it means much in retention of heat.

The first step is to provide sufficient space for the heating material. Referring to figure 17, *b* shows a hot bed 6 ft. wide, and the space around should not be less than 3 feet, and in the North even 4 feet would be no mistake; in depth, 2 feet below the surface is about right. This calls for a large stock of manure, but the manure not only gives a complete and paying bed, but it is afterwards on hand for enriching the garden.

#### Foundation.

This is a matter that may be new to many, but by proper attention to it the bed will retain an exact position without reference to the settling of the manure. In the case illustrated the foundation consists of oak stakes  $3\frac{1}{2}$  feet in length, driven into the ground to a depth of about 2 feet. For a four sash bed I use twelve stakes (*a* in the sketch). These are driven home and capped by a plank ripped into three pieces, 5 or 6 inches wide, and as long as the bed is to be.

#### The Frame.

The frame is set upon these planks as shown. Within this frame is a bottom made of 1-inch rough boards which rest on the strips, and on this is placed the soil. Thus is the bed firm, and will last for at least ten years. To prevent heaving of the stakes previous to making-up

#### Heating Material.

The main reliance as heating material for a hotbed is strawy horse manure, or a mixture of this and other fresh manure. Forest leaves are excellent to mix with the manure, as they decay slowly, tending to prolong fermentation and also to make the heating more uniform. Preparation for the manure supply must be made some time ahead. If it can be had from livery stables matters will be facilitated much, as a quantity of almost fresh material can be secured within a few weeks. In accumulating manure for use in hotbeds it may be kept for some time, provided it is in the dry, and that it lies loosely enough to not excrete much heat. As new supplies are got, they may be added, and the entire pile turned and shaken up with a fork, about once a week.

ELIAS A. LONG.

**The Biggest Eastern Fruit Meeting of the year** will be that of the Connecticut Pomological Society at Jewell Hall, Hartford, Tuesday and Wednesday, February 9 and 10. Lovers of fruit culture from adjoining states are cordially invited. H. W. Collingwood, Professor Van Deman, N. S. Platt, S. D. Willard, Professors Gulley, Britton, and Sturges will be leading speakers. Full programmes can be had on application to Secretary G. S. Butler, Cromwell, Conn., or President J. H. Hale, South Glastonbury, Conn.

## New Jersey Horticulturists.

There was one pessimist at the recent annual meeting of the New Jersey Horticultural Society. He launched a bolt as follows: "With asparagus selling at less than cost, apples at ten cents a bushel, sweet potatoes at eighteen cents, and other things in proportion, how long will it be before the Sheriff takes control of our affairs?" But the dire prospect created only a ripple of laughter, and, indeed, one man said, later, that New Jersey fruit growers of all men had little cause for complaint or fear, because so encompassed with good markets near at hand.

The death of W. R. Ward, brother of President J. B. Ward of the society, occurring just before the meeting, caused some confusion in the programme. The President's address was necessarily put over till the second day, and one of the first papers on the programme was a memorial biography of this honored horticulturist.

Among matters that came up late in the session, and were, therefore, merely mentioned, was the coming exposition at Hamburg, Germany, in May, 1897. It was stated that California had already taken 4,000 feet of space, and concerted action on the part of Eastern growers was urged, especially as the exhibits might lead to the opening of valuable markets for some of our products.

### Asparagus Rust.

Professor Byron D. Halstead, of the Rutgers College Experiment Station, gave a somewhat emphatic warning concerning the evil results of neglect to combat the new asparagus rust. This has already been reported from all the Atlantic States north of Virginia, so much so that no other known rust has been so overwhelming in its attacks. It is a fungus growth, and as it develops the field turns prematurely brown, while the stalks themselves seem blistered, and are heavily covered with lines of brown. The spores germinate most quickly in the warm, moist weather of spring. These must be destroyed immediately after the season's cutting is over, and it is necessary to take the additional precaution to carefully burn all brush and remnants in the fall. Burning the fields may do some damage, but it is not to be mentioned beside that induced by the ravages of the rust. The variety Palmetto seems to be partially exempt from attack.

### San Jose Scale.

Concerning the San Jose scale, Professor J. B. Smith, of Rutgers, said practically that Eastern growers must work out their own salvation therefrom. Professor Smith has lately made a tour of California, for the express purpose of studying this pest, going not into selected show orchards, but according to his own choice in the infected districts. The fact that no one pretends to grow fruit in California without insecticides is suggestive, and as, notwithstanding their assertions, no one was able to show Professor Smith a single specimen of *Rhizobius debilis*, it would seem certain that the claims to controlling the scale by means of this lady-bird were without basis of fact.

The pear blight and the root gall of the peach were referred to as creating considerable alarm through rapid increase.

### New Fungicides to Come.

While Bordeaux mixture has been the first reliance in fighting the new rust, Professor Halstead's later experiments promise several new fungicides all free from the worst faults of the Bordeaux mixture. These will soon be made public in an official bulletin.

**Insecticides.** Professor Smith recommended the use of bi-sulphide of carbon for the melon plant louse. The best grades of whale oil soap had been rather satisfactory in combating the San Jose scale, clearing young trees effectively; the formula is two pounds of the soap to one gallon of water. If the soap be good, this mixture remains liquid when cold. The use of pure kerosene has been noted by Professor Webster, but this is not as yet officially recommended.

### Fruits on Exhibition.

These consisted of numerous plates of handsome apples and fine specimens of Japan Giant and Japan Mammoth chestnut. These last were shown by the Parrys of chestnut fame. Some of them measured

over two and a half inches in breadth. Prominent among the apples were Ben Davis, Lawver, Cooper's Market and Baldwin. The largest apples shown were of a handsome red sort, from Samuel Miller of Sussex County. He stated that the apple was commonly grown in his neighborhood, and a most excellent fruit it is, but no one was found who was able to give it a name.

### Peaches.

Mr. Miller is an enthusiastic and successful peach grower; a young man, who may yet prove to New Jersey what the veteran Samuel Miller has to a sister State. In a most excellent address he spoke of peach growing as well adapted to men of small means, for the reason that peach lands, in New Jersey especially, are comparatively cheap, and the first investment of money need not, therefore, be heavy. He selects land thoroughly drained, at a good elevation, so as to be free from spring frosts, uses a moderate amount of stable manure with other fertilizers, plants 16 feet apart and prunes sharply for the first year or two. He spoke of high color as a key to high prices in the New York markets. His fruit last year was marketed in five grades, and he found that the use of small baskets added about 75 cents to the price of each carrier.

### Apples.

Emmor Roberts, of Fellowship, knows apples from A to Z. He defined an orchard to be "As much as one can manage, and as many more as he chooses." His motto was: "Every tree under cultivation." Some of his words of wisdom were: "Leave out Duchess of Oldenburg; Williams will give twice as many apples in our State. Red Bletighelmer is good, but you don't want it; Gravenstein will outbear it ten to one. Leave out Northern Spy; it is not worth growing in our State (nearly every grower concurred); Yellow Transparent is good, but it must be handled like eggs, as it is so tender. Cornell's Fancy is a fine grower, a great bearer, large, splendid to sell; but it is very apt to die at maturity. Nero is very handsome, a magnificent apple to look at, but has the reputation of not being a good cooker; Lawver is handsome and keeps like a paving stone, but not every one likes paving stones; Ben Davis is good for nothing, but is rarely beautiful, and is the great apple to sell, after all."

### Strawberries.

L. J. Farmer, Pulaaki, N. Y., gave some of his methods and experiences. He thinks the great need now is a better quality and some systematic, official method of testing new varieties before pushing them on the market. His spring treatment of strawberries differs from that in general use. The plants are taken up very early and trenched closely in sloping trenches, about seven inches deep, twelve to fifteen plants to the linear foot, and crowns even with the surface. The roots are clipped before trenching. The whole surface is mulched, the beds (each consisting of three trenches eight inches apart), thoroughly soaked, and a week after, sprayed with Bordeaux mixture. The plants are kept in the beds, where they can be frequently sprayed for mildew (which in Oswego County is worse than rust) about six weeks. Ten thousand can thus be treated on a square rod of land. About May 20 the plants are set in the fields, and will ordinarily need no more spraying until after they have made a crop. Mr. Farmer puts the winter mulch on early, about as soon as the ground will bear a wagon. Horse manure is the preferred mulch. Varieties recommended for his section are Parker Earle (the best ever tested), William Belt, Brandywine and Marshall. Mr. Farmer referred to the fact that driving winds often waste the pollen and make the berries one-sided.

### Ornamental Plants.

As a matter of business sense, W. A. Manda, of South Orange, put in a plea for a better display of plants by those who have them for sale. He asserted that people can seldom be induced to ask for, or to try anything they have never seen. A fine garden, he said, is prettier than anything you can buy for inside furnishing of the home. This last is always the same, while in the garden there is always something new. The best general indoor temperature for the house was named as 45 to 55 degrees. The best fertilizer, sheep manure or bone; the latter, if granulated, lasting at least

three years. The best palms for the house are the two Kentias, Beilmoreana and Fosteriana; Araucaria excelsa is also a fine house plant.

### Commission Men.

Horace Roberts, Fellowship, spoke some good words for the commission men. While considering retail markets much more stable than those at wholesale, he considered the commission men a necessity, but urged staying with one dealer long enough to become acquainted both ways. The commission man must be our friend, or he is worthless to us. These men usually prove careful and honest. Careless packing is the great drawback. California realizes this; her growers are no shrewder, no more conscientious than those of the East, but practical experience has taught them that they cannot afford to lay their fruits down in our markets other than nicely graded and finely packed, hence they have co-operated, almost universally, to secure this necessary end. That honesty is the best policy is considered ethical wisdom, but many seem to believe it to be business foolishness. It is not. It is good business sense.

### Officers.

The list of officers stands the same as last year, the very few changes being made in the committees only. Charles Black, of Hightstown, was named as the society's delegate to the State Board of Agriculture meeting on the 12th inst.

## The Vegetable Garden.

**Mushrooms.**—No garden is complete without mushrooms; they are the daintiest of all vegetables. They are easily grown if given reasonable care. Many articles on their culture having already appeared in these columns, I will offer only a few points in addition—points which appear to me to be overlooked by most writers. Care should be taken to procure fresh horse dung from stables where horses are fed hard grain and hay only; the dung of horses that are pastured, or are given rations of carrots, apples, or potatoes, or from animals that are not healthy and are doctored, is to be avoided. After growing successfully for a number of years, I was baffled with failure after failure, and after much loss of time, trouble, and experiment, I discovered I was using just such manure, and that such will not produce mushrooms. The beds should be located where there are no draughts, where temperature varies but little, and where a mean of 58° can be kept up without drying the beds. Good fresh live spawn is absolutely necessary, and should be procured from reliable houses. The spawn is a good deal of a mystery; we cannot see it germinate like any seeds, and I know no way of testing it. We may see the fine threads of the mycelium in it, yet it may be dead; frost will not hurt it, but dampness and dry heat will. I once made a bed in the fall in an unheated structure. Just as it came into bearing it froze up solid and remained so four months. I feared the results, but when the warm days of spring came we had the heaviest crop I ever experienced.

**Mushroom House.**—A mushroom house adjacent to the north side of the greenhouse and heated from the same boiler, is one of those conveniences that should be a part of every garden. A house 20x10 feet is ample for a private place.

**Seakale** is one of those neglected vegetables that are useful for winter, it may be easily forced in the mushroom house. Roots from two-year old plants from seed, or one year from cuttings, with a good crown, are best for the purpose if trimmed to about 6 inches in length. They should be planted close together every two or three weeks for succession. Seakale may also be grown under greenhouse benches; it must be excluded from the light.

**Rhubarb.**—By having a few good roots dug up, allowed to freeze a little, but covered with leaves or otherwise protected,

so that it can be had when needed, and treated as advised for seakale, this will succeed admirably and is very acceptable.

**Shallots.**—If planted in November in a sheltered situation and mulched, will be fit to use early in spring.

**Hotbed Manure.**—It will soon be time to look after the manure for this purpose; wherever possible have it collected and conveniently located.

## How to Make Hotbed Mats.

RANDALL N. SAUNDERS.

A very serviceable and efficient mat for the protection of hotbeds and cold frames may be woven easily from rye straw by a method illustrated and described here with (figs. 18, 19). The work is one that may well be done at this season.

FIG. 18.—STRAW MAT MAKING FOR HOT-BED COVERS, ETC.

**Broken Glass.**—All broken sashes and other repairs should be promptly attended to.

**Straw Mats and Shutters.**—We manage to make a good supply of these during severe weather. Straw mats can easily be made by two handy men. W. M. EDWARDS.

## Lawn and Flower Garden.

**Trimming Up.**—This is a good time to cut out all dead limbs, and indeed, there is no time to be lost if Maples are to be headed-in, for if the work be not done before the sun gets strong, the trees are apt to "bleed."

**Pruning of Shrubs** will also take up our attention. This is a subject sadly neglected, and I still note the broom system is the prevailing style. Everything is cut back indiscriminately, without regard to time of flowering. Spiræa, Forsythia and Weigela receive the same treatment as Hydrangea paniculata. By such practice, what should be a pleasure to look upon becomes an eye sore. Here is the rule: shrubs that flower in spring and early summer ought not to be pruned until after they have finished flowering; shrubs that flower in the fall may be close pruned in the spring.

**Preserve the Grass Edge.**—Drive stout stakes on the corners of the carriage drives, so that when a snow storm comes, wagons will not cut the corners off the grass. Stakes should be driven at intervals all along the drive, so that no one can mistake where the drive is in a snow-storm such as we have already had this winter.

**Look Out for Mice** in your beds of Hyacinths and Tulips. They are also destructive to *Ampelopsis Veitchii* planted on old walls.

JOHN SHORE.

**Southern Indiana** as a fruit producing section is growing in importance, and although last year did not give much to encourage those already in the work, many growers are increasing their acreage. W. W. Stevens, of Salem, has coming into bearing 12,000 pear trees, all of one variety.

which you pinch hard and flat while making two half hitches around the tight string with the free end *b* (fig. 18). Take the other outside string next and repeat the process till all five strings are fastened, holding the first course firmly. In each case, with the first course or whisp, make a double half hitch to keep the taut string from slipping; one-half hitch for the other courses is all that is necessary (fig. 19). To finish the mat, loosen the strings at the bottom and tie several tight flat knots.

The experience gained in making one mat will suggest many minor things that might be confusing if brought into these directions. A little practice will enable one to turn off two or three mats an hour. The frame on which the mats are made may be fastened flat on a barn floor, or, better, firmly on saw horses, as this arrangement lessens the number of motions, and is not so hard on the weaver's back. Some sort of rack or frame should be added to hold the loose straw of which two bundles are required for a mat, and these should be within easy reaching distance. These mats can be used for a variety of purposes where some reliable protection from the cold is needed, and if well made and properly cared for will last several seasons. Their durability depends chiefly on the quality of the string and straw used in their construction. Select a hard tough quality of string and the very best, straight, bright rye straw.

"Roads are an index to civilization. The better the roads, the higher the civilization. Take any section in this country with good and poor roads and compare them, and you will see the truthfulness of this saying."—S. R. HUDSON.

**Worcester, Mass.**—At the last meeting of the Worcester County Horticultural Society, Adin A. Hixon was elected secretary, to succeed the late E. Lincoln. It was voted to hold a Chrysanthemum show each year, and an appropriation of \$300 was made, outside of receipts.

The Mat Complete.

Section Showing Half-hitch.

FIG. 19.—STRAW MAT MAKING FOR HOT-BED COVERS, ETC.

these strings taut around the nails at the top, but do not wind or tie them. Now take a long whisp of straw, divide it into halves, place heads together and butts out, reaching across the frame and touching the guide boards. Begin at one of the outside strings, draw it up tightly around its nail and over the whisp,

**Export Apple Trade.**—Reports from the transatlantic apple market show that, on account of the heavy exportation of American apples of inferior grade, they are lying on the piers in London, Liverpool and Glasgow, and decaying while awaiting purchasers at from 1s. to 4s. a barrel (25 cents to \$1.).

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1904.

PUBLISHED BY  
A. T. DE LA MARE PTO. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1697.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**Plant Registration** **S**INCE we first drew attention to the proposition to establish a bureau for the registration of new introductions of fruits, etc., there has been some correspondence upon the subject, and, so far, no decidedly favorable comment. No doubt the intention of the proposers has been misunderstood; it would not be practicable nor politic to endeavor to coerce the fruit grower into a submission to a prolonged testing of his novelty, nor could there be any hope for the success of the proposed bureau if it were to arrogate to itself anything approaching the duties which, by some of our fruit raisers, have been assumed to be the objects.

Fruit growers themselves suffer from the present methods of introduction, that is acknowledged by themselves, it was brought out before the New Jersey State Horticultural Society's meeting, by L. J. Farmer, of Pulaski, N. Y. The evil exists; how shall it be met, how remedied?

As was ably demonstrated by our correspondent, W. H. Ridgeway, in last week's issue, no reports, no tests, no opinions, can be relied upon by the commercial grower, as to whether a given variety will do well with him; the various factors which combine to make a variety a "good thing" for one man to grow are not the same as those sought

for by his neighbor; the two men may cater for different markets, perhaps their soils and methods are not identical, and that some one variety does well everywhere only proves its power of adaptation to varying conditions.

But what is wanted is the guarantee that a novelty offered to the public is distinct from others already in existence, and if the proposed bureau undertook merely to certify to that one fact we opine that it would be welcomed by the better class of fruit growers and novelty raisers. And this argument holds good not only of fruits but also of all other garden stock; the flowers, the vegetables, the trees and shrubs should be placed before the public with the guarantee of distinctness. Surely the public would be more ready then to invest money in a novelty. So far as the florists are concerned, the principle here advocated is already an accepted principle, then why not also for fruit raisers?

**American** **D**OES priority of title carry with Horticultural Society. it any weight? In this connection it is well to call attention to the action of those gentlemen who recently met in New York and formed an association entitled the "American Horticultural Society;" full details of the procedure on that occasion were given on page 44 of our last issue. The excuse of ignorance cannot be made with any justification, for due warning had been given to the organizers that the name they suggested already designated a body in existence, and possessed of a decidedly national character. It is not convenient to have two bodies with identical names, letting alone those considerations which surround the questions of expediency and of courtesy. As the American Gardeners' Society (the title originally assumed), there was a definition of the field of action, and an understandable basis of foundation, but as the American Horticultural Society one is at a loss to reconcile the tactics of the leaders, as displayed in action and in words, with the all-embracing, all comprehensive meaning of that designation.

The American Horticultural Society, which was organized some fifteen years ago, was, we believe, the outcome of the old Mississippi Valley Society, and worked much upon the lines of, and in conjunction with, the American Pomological Society, in so much as the meetings of each were held every two years, and alternating with each other. These meetings were held in various states and the published reports of the American Horticultural Society contain some by no means valueless contributions to horticultural knowledge. The president is Parker Earle, of Illinois, recently removed to New Mexico, and perhaps 'tis his removal that accounts for the failure to meet when last due. The treasurer is J. C. Evans, of Kansas City,

Mo. That the Society was a decidedly live one is well known; that to-day it is dead is by no means proven because no large gathering has recently taken place. If the body does intend to dissolve, however, there would be some reason for the assumption of its title by the new Society, but until that is known by a written communication, the advisability of the duplication of names must be questioned.

It has been stated by the president of the newly born Society that the horticultural press has treated the matter of its foundation with scant courtesy, whereas the facts are decidedly otherwise. AMERICAN GARDENING has given in the past, as it will give in the future, publicity to all progressive movement, but it always stands by its duty and right to criticize when such a course seems necessary for the benefit of the majority.

That a national organization is needed no one would question after witnessing the earnestness and goodwill of the gentlemen who met in New York lately; but so far as the matter has progressed the outlook is not as bright with promise as, in our opinion, it would have been had the organizers held to their logical aims, and had founded a Gardeners' National Society.

## Gros Colmar Grape.

Our illustration on page 49 depicts faithfully a bunch (reduced one-half) and natural sized berries of this the most popular of all hothouse grapes for late crop. The chief claim that it has, and which tends to make it so popular, is its magnificent keeping and shipping qualities. In flavor it does not rank with some of the thinner skinned grapes, such as Black Hamburg, and other summer or fall grapes; but when they are only a memory, Gros Colmar begins to improve in flavor, and so continues to better the longer it is kept. Indeed, it is never fit to eat before November, although ripened in September. Its season then may be said to be from November to March, and it will keep even longer. Another desirable feature of this grape is the great size of the individual berry, which at once makes it the most showy grape possible to put on the market. It also colors fairly well. Its thick skin and firm flesh enable it to stand shipping remarkably well, which fact is amply attested by the superb specimens to be seen in the windows of our leading city fruiterers. It seems barely possible that they have traveled over 3000 miles from either the Channel Islands, Belgium, or England. They are packed 24 pounds in a box; each bunch being put into a paper bag, and the bunches hung on wooden strips; the whole box is then packed with cork dust and transported on fast steamers. In the course of a season's trade—that is, from November to March—there are shipped from 12,000 to 15,000 pounds. At wholesale the prices vary from 75c. to \$2.50 per pound.

**Eastern N. Y. Horticultural Society.**—A preliminary meeting for the organization of a society as above will be held at St. Thomas' Hall, Cornwall, N. Y., Monday, January 25, at 10.30 A. M.

## FOREIGN CORRESPONDENCE.

## Orchid Collector J. E. Lager Fears Extinction of the Plants—European Methods Criticized—The Coffee Industry Destroying Orchid Grounds.

Orchid collecting in these regions is getting more difficult and expensive every day for several reasons. In the first place the plants, without exception, are fast becoming scarce, on account of the constant drain upon them. Secondly, on account of the coffee industry, which is taking gigantic proportions here these last three or four years, for which purpose large tracts of forest are cut down, and as it happens that the coffee region is exactly the Orchid region, comprising as it does a belt of from 2000 to 7000 feet above sea level, the consequences are so much the more serious.

Below and above said elevations few useful species of Orchids are found, and if matters continue as they have commenced, we will very shortly have to pay high prices for Orchids, and then probably not be able to secure any in quantities.

Only four or five years ago I myself thought that the region where *Cattleya Trianae* occurs, and also that of *C. gigas* were inexhaustible; however, this has not proved to be correct, since now in the very best districts the plants are very much retired, causing heavy expenditures in order to extract them. Freights have increased 100 per cent. on account of scarcity of beasts to move the coffee crops.

The Department of Antioquia is still the best and most interesting to the collector, as a great number of species are found here, although getting scarcer every day. In the northwestern part of this Department we find *Cattleya gigas* and the beautiful *C. aurea*—the latter in very limited numbers—and also *C. Skinnerii*, besides a lot of miscellaneous plants, among which are: *Oncidium papilio*, *Houlletias*, *Anguloas*, *Pescatoraeas*, *Peristerias*, *Acinetas*, etc. *Miltonia vexillaria* still occurs plentifully in certain districts, also owing largely to the decrease in exporting this beautiful Orchid of late. In the Department of Tolima there are few things worth collecting except *Cattleya Trianae*.

Patche in Cundinamarca is still the center of *Odontoglossum crispum*, in the collecting of which great difficulties have arisen lately. Greed and overzeal practiced here by some European firms, is the principal reason for this state of affairs. Men are sent out with instructions to remain in one place three and four years or even more, the consequence of which is that the owners of the forests simply, and very naturally, think there are millions to be made in the business, and prohibit the extraction of the plants, unless the collector is willing to pay tribute or submit to the conditions imposed by the owners, which are very often excessive, though the principle is by no means unjust.

It is generally imagined that most of the forests here belong to the one that first comes, or at the best that they are owned by a lot of savages.

Nothing can be false; most of the accessible forests and mountains are, with but few exceptions, taken up, and a great many of the people here are well educated and of good standing financially. Another practice worth criticising here is that some parties solicit their plants through natives, who do not know the plants well enough, besides which they ignore how to treat and pack them.

The consequences are bad for all parties concerned, although I am sorry to say that the shipper is generally the loser in whatever state the plants arrive. However, this state of affairs is not the rule, but it is, unfortunately, too often practiced.

*Cattleya Chocensis* still occurs plentifully in the State of Cauca, though its district is comparatively limited. The forests here in the proper valley are on level land, and its destruction is progressing in the clearing of tracts for pasture lands.

In the Department of Santander, we find *Cattleya Mendelii* fast disappearing, while *Cattleya Schroederæ* is comparatively abundant, but its extraction is expensive on account of the long distances the plants have to be transported.

In short, the day is not very far off when these beautiful plants will be extinct and things of the past.

JOHN E. LAGER.

U. S. Columbia, S. A.

## READERS' NOTES AND COMMENTS.

**Staking Trees.**—It was with interest that I read Elias A. Long's article "Why Stake Trees," page 18, and I herewith submit sketch showing the method that I use,

FIG. 20.—AN EASILY ADJUSTED TREE STAKE.

(fig. 20). I take 2-inch chestnut planks and have them ripped into strips 2 inches wide, sharpen one end, and, after starting a hole with a bar, merely to get the course, drive the stake home with a maul. Used as shown it answers every purpose that three stakes do, keeping the tree from swaying in either direction, takes but one-third of the material and labor, and when driven in line with the trees is not unsightly or in the way of the cultivator or hand hoe. I also wrap the tree with a piece of matting and make it fast to the stake with tarred cord. I think it advisable to remove the wrap at least once each season, as I have found borers at work under it in several cases. It takes a pretty good man and soil free from rocks to drive three stakes, as Mr. Long describes, and have the tops come where you want them.—J. E. PRIOR, Moosup, Ct.

**Over Sanguine.**—As regards those "wonderful successes," as stated by the writer of "Money Methods in the Market Garden," while I admit them to be possible, I am afraid such extravagant statements often lead the inexperienced into an undertaking only to meet with failure. And to those that have experience in the business, and compare their own results with such accounts, there is either a rather discouraging tendency, or they don't believe.—C. ANSCHICKS.

[By all means let us have both sides of a question. It is only by the bringing forward of evidence to show what may be done and how it is done by live workers that there can be any progress in the large mass of those not so advanced in their methods. It is our duty to lay before readers not only what is done, but what may be done by proper seizure of opportunity. Discussion of any topic treated upon is not only welcome, but eagerly sought. Let us have some more.—Ed.]

**Cutting Strawberry Runners.**—Replying to the question on page 13, a few years ago I made myself a device for cutting the runners on the edges of strawberry rows as follows: I procured two cutting discs, such as are used on sulky plows, and had a blacksmith fit to each an axle, about 18 inches long. These I fastened one on each side of an "Iron Age" cultivating harrow in such a way that they would cut a little deeper than the teeth on the cultivator, and the width could be regulated with the same. This appliance works all right enough, but during the last few years strawberries around here made such poor growths that there were not any runners to cut off.—C. ANSCHICK, Ill.

—Other correspondents are also thanked for information supplied.—Ed.

**Holland Pippin.**—I have been much interested in J. Holloway's fruit articles in AMERICAN GARDENING; I heartily approve of his idea that it is too apt to be the case that the older varieties are overlooked in the planting of orchards by reason of the glowing descriptions given to the newer varieties. The mention of the best of the older sorts on page 21, leads me to ask you where I can get the Holland Pippin, which is spoken of as among the best sorts. I formerly grew this variety, but the tree died, and I am now anxious to graft over some old trees with it, or set out young ones. I think it one of the best of its season, and the difficulty of finding it among the nurserymen shows that it is not appreciated as I think it should be.—HORACE EATON, Elmwood Ave., Cambridge, Mass.

## Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

C. E. WHITTIER, Bridgman, Mich.—Catalogue of Strawberry and other fruit plants.

JAMES J. H. GREGORY & SONS, Marblehead, Mass.—A Comprehensive List of Home Grown Vegetable and Flower Seeds, also condensed list of Fruits and Appliances.

HENRY A. DREER, 714 Chestnut st., Philadelphia, Pa.—Annual Catalogue of Seeds of all sorts, Plants, Trees and Shrubs. Much space is devoted to Aquatic plants and the catalogue will be of much value to owners of water gardens. All sorts of tools, implements, pots, etc., are included. The cover has an illustration of the new white Cosmos "Dawn."

PETER HENDERSON & CO., 35 and 37 Cortlandt st., New York, issue their Jubilee Catalogue this year. It is a handsome book with colored plates of Pansies, and the new H. P. Rose Jubilee; also Japanese Morning Glories, Vegetables, etc.; a manual for the garden. A prize is offered for a name for new Pea. (Sent for 20c.)

## The Fruit Garden.

**Look Out for the Lackey Moth.**—When pruning apples and pears, keep a sharp lookout for the eggs of *Bombyx neustria* (the lackey moth). The eggs are generally on twigs about the thickness of a lead pencil, and are easily noticed when you know that they look like a bracelet of 10 to 15 spiral rings of very small glass beads set in brown varnish. The eggs hatch in May, and then we wonder at the number of bunches we failed to see when pruning. We are very busy about the time they hatch, and may not notice the fine work the caterpillars are doing until they ruin a whole branch, then it means either loss of time, or the branch, which must be handled very carefully, or many of the caterpillars will drop to the ground on a very fine thread, and travel off at a surprising speed. Another species, *Eriogaster lanestris*, works in much the same way. The eggs look like a small patch of mouse-colored fur; a little carefulness now will make quite a difference in May, when the days are only half long enough for the work on hand.

**Old Trees.**—Look over the old trees; some of them will be the better by having a branch taken out here and there to let in the sunlight (not the full glare), to secure well-colored matured fruit. Don't forget to smooth and paint the cuts made. If the variety be good and the tree solid, but making very little wood, break in a heavy dressing of manure; apple trees should each season make 8 to 15 inches of wood on all the leading branches. Any trees showing rotten branches should be taken out and others planted, but not in the same place, unless that be absolutely necessary; when so however dig out and cart in ten or twelve loads of good soil.

**Plums.**—Are you growing any? If you have only room for one tree, plant the Japanese *ABUNDANCE*. The cucullo will try the fruit, but I note that it is almost proof against the attack. The amount of fruit the tree will carry is wonderful, and needs thinning severely. The fruit is a bright cherry red, and is covered with a delicate white bloom. It is in use here by August 1, finished August 18. *ORGAN* is a meaty, clean, attractive yellow fruit, almost round, in use July 25. Tree not quite so thrifty a grower as *ABUNDANCE*. *SIMONI*, another of the Japanese, looks like a peach tree; fruit brick red, with dark cheek; ripe August 8. It is really more ornamental than useful. It will set off a dish of *ABUNDANCE* and *ORGAN* to perfection, and the aroma will fill the room. I consider the flesh too firm and the flavor too peculiar to make it popular for general use. *KELSEY*, the tree is a little on the peach style of foliage, and is a good grower, and has any quantity of flowers, which, for some reason, do not set. The few fruits I have got were very fine in every respect, heart shaped, ripe September 16, coming in with *Coe's Golden Drop*. *WASHINGTON* is a handsome plum of good quality; in use August 19. *PURPLE FAVORITE* is also a fine-flavored plum, ripening with *REINE CLAUDE DE BAVAY*. The latter has not been very satisfactory here yet. *SHROPSHIRE DAMSON* is a great bearer, and is very satisfactory for cooking, lasting in season a long time; ripe September 10. Our plum season closed with *SCHUYLER'S GAGE* and *GERMAN PRUNE*, October 2. Plum trees with few exceptions are upright growers, and if cut back hard when young, we get three to five more shoots for our trouble, but if thinning is practiced, the spurs will form along the leaders, and bearing will soon stop the rank growth and bring the leaders down. The pruning is best done in early spring.

**Black Knot.**—Now is a good time to look for any black knot that may be around on

any plum or cherry trees. If the branch can be spared, cut it out; if it be not very badly affected cut the knot out as cleanly as possible with a knife, and then paint over the wound.

J. HOLLOWAY.

## The Apiary.

**Supplies.**—There is a two-fold reason for at once laying in supplies needed for another season: 1st, They are then on hand when needed and may be put into shape for use at a time when work is not so pressing; 2d, prices are almost certain to be higher later on. Most dealers make a special discount on out of season orders, the usual scale being about 4 or 5 per cent. Besides, there is quite a tendency among manufacturers toward higher prices for 1897. This is particularly true of sections, on which several of the leading manufacturers have already announced an important advance. This is due to the fact that in competing for business during the hard times they overstepped the lines of a living profit, and are now obliged to hedge.

**Color in Sections.**—Most bee-keepers have been wedded for the last few years to "snow-white sections," and considered any other kind utterly impracticable in the production of the best white honey, cream sections being regarded as fit only for second grades or for home consumption. Recently some one has discovered that this has been carried to such an extreme that the sections are in many instances whiter than the whitest honey, and the latter, instead of being more tempting on the market, actually suffers by comparison. Just how much of a reaction this will cause, it is hard to say, but there is no question but that the white section has been overdone by bee and commission men.

**The Honey Supply.**—People who fear an over-supply of honey should remember that at present the annual honey yield in this country is not sufficient to allow each person one pound a year. Estimating that one-half the people do not care for honey and that one-half of the remainder are too poor to buy even a pound or two, there remain only four pounds to each person, rather a meager annual allowance for a lover of honey. This estimate makes no allowance for the amount consumed by bakers, tobaccoists, confectioners, etc., who annually consume many tons. One Wisconsin biscuit and confectionary establishment alone is reported to use ten tons annually.

**Commission Men.**—Several new commission houses in Chicago and elsewhere have been entertaining bee keepers with their tales of better prices than the old concerns were getting. Look out for them. Some have already disbanded under pressure, but "there are others." It is pretty safe to make careful inquiries before consigning goods of any kind to any firm offering more than market prices, and the old houses experienced in the business are not likely to take less than market price.

WILDER GRAHME.

## Bulbs in Storage.

Even though the bulbs were put away with care earlier in the season, it is wise to give them a look now and then. As the seasons pass, they vary much as to conditions of dryness, etc., and some bulbs may be gathering mold when we thought them all right. Dahlias and Cannas will need a look, to see that the first are not shriveling, nor the second rotting. Gladioli will like to be dry but cool; Tuberose must not occupy a station where the heat falls below 40°.

## AMERICAN GARDENING AND THE OHIO FARMER,

Both One Year Each for only \$1.60.

**THE OHIO FARMER** is a large, 30 page weekly, \$1 per year. A National Farm, Stock and Home Journal, and is clearly the Leader of the Agricultural Press of America. It pays more for illustrations, Correspondence and Market Reports than any other of its class. It is the Best and Costs no more than others. Send for a **SAMPLE COPY TO THE OHIO FARMER**, Cleveland, O.

**THE OHIO FARMER** will start their paper the date the order is received by them, and continue to Jan. 1900—14 months, if ordered at once. Address all orders to **AMERICAN GARDENING, P. O. Box 1697, New York**

## Russian Fruits in Iowa.

Ten to twelve Russian varieties could be classed as winter sorts in central Iowa, the balance are fall and summer sorts in that section; when grown further north there are a greater number of fall and winter sorts. Two experiment stations under the supervision of the State Horticultural Society are within 12 miles of the city of Des Moines, and the one reports adversely on every and all fruits of Russia, while the other brings annually to the great State Fair quantities of varieties of fine fruits of that type. The main experiment in the West as regards this line of fruits is within 33 miles of the city, and there are grown successfully 135 varieties. On general principles the south half of the State, and many sections of the central parts, have common sorts adopted out of the old list.

The Russians, as a rule, are not high in quality, but there can be found some fair to good fruit ranging as good as Ben Davis, Willow, Fall Orange, Coles Quince, and few better. Two that attracted considerable attention this season were True Good Peasant and English Pippin. As to their being of no use in south half of the State, we simply present the fact that the first award among 15 to 20 exhibitors went to Longfield and Tetofsky last season, fruits shown by southern Iowa exhibitors. Not many years ago the Walbridge and Pewaukee had a boom and many friends. These are both inferior to many Russian sorts, and were largely planted in some sections; if Russians had been planted in their stead it would have been far better for many sections, especially as regards such varieties as Longfield, Tetofsky, Good Peasant, and Zuzof's Winter.

There are personal antagonisms between Iowa horticulturists on the subject of Russian fruits, and extreme views are uttered on both sides of the questions. A large number of private experiments are made by farmers, and those not connected with the State societies' work, and we regard these sources of information the most reliable. To illustrate, there is an experiment station but a few miles from the State Fair grounds that reports every Russian variety of plums an absolute failure, and that it has been a necessity to dig up and destroy the trees. A farmer not far from this station last year brought two sorts of plums to the horticultural hall to be named, saying he got the trees with others from the introducer of Russian fruits, and had lost the labels, we compared them carefully with plates of a half dozen exhibitors of Russian fruits, and they proved Hungarian Prune, and Communia, which were grubbed out and reported a failure from the station. At three years four whip trees bore nearly a bushel per tree. On the other hand, we have the Moldavka, a yellow freestone variety, last season bearing fruit 2½ inches in circumference, and of good quality.

There is a part of the Russian work that is not so very amusing, but decidedly interesting to those who are opposing, and calling in question, the motives and all acts of the introducer of this class of fruits. It is that class of agents, dealers, and nurserymen who, during the boom of the Russian fruits, sold trees of American sorts with Russian labels on them to make the most money possible out of the boom while it was on. This class of agents, dealers, and nurserymen is now seeking to lay all the blame on the originator of the Russian fruit scheme.

There is a large amount of responsibility connected with the introduction and dissemination of any line of fruits; but if any line is well started and it creates a boom, and trees get into the nurseries and are sold as true to name and before they are tested, a mistake is a very natural consequence. If tree dealers and agents of nurseries, with or without authority, give out trees not true to name just to catch the prices the boom makes possible, while there may be some degree of responsibility for the origin of the work resting on the originator, the moral crookedness, and the odium of putting out trees not true to name, so as to reap the pecuniary advantages of the boom, is very conveniently shouldered onto the originator or introducer. There are some well planted orchards that now make a very bad showing against critics of Russian fruits.

W. M. BOMBERGER.

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

Do not set trees or plants too closely together.

The Evergreen Belt is a decided protection these cold winter days.

Colored Plates of fruits are mostly misleading.

House Plants require special care this cold weather.

Prentiss Grape.—This variety has proved disappointing to many.

Winesap Apple gave excellent satisfaction this year.

A Heavy Coat of fine rotted manure put on the flower beds now will be very beneficial.

North Star Currant is not much larger than Red Dutch when the latter is well cultivated.

Grapes for Home Plot.—A neighbor in selecting six grapes for the village garden, chose two Worden, one Brighton, one Agawam, (Rogers N. 5), one Niagara and one Moore's Diamond.

The Habit of Observation is worth much to the fruit grower.

Irrigation for Strawberries.—He who has a good irrigating plant on his strawberry grounds shall have fine luscious berries.

Glass for the new greenhouse, hothouse or hotbed, is it ordered yet? It is nearly time to use it.

Horticultural Literature.—How much of it are you reading this winter?

Cultivation.—If the orchards have been well cultivated and properly pruned for a few years, it has been found that it paid well.

One Good-Sized Crab apple tree is enough to supply one family.

Duchesse D'Angouleme pear proves to be very satisfactory as a dwarf on rich loam, with clay sub-soil.

The Industry of growing vegetables, as lettuce, radishes, etc., under glass, is proving profitable.

Ostheim Cherry.—If a good variety of sour cherry be wanted, try the Ostheim.

A Fair-Sized Hothouse for growing vegetables, etc., can be built at moderate cost.

Plant and Seed List.—Is it made out yet? First come first served is generally the rule with nurserymen and seedsmen.

Do Not Expect an orchard to bear year after year the first grade of fruit without liberal fertilizing.

Nemaha Black Raspberry.—I have tested this and do not consider it worth as much as the Gregg.

Carter's Seedling is a new strawberry which is a very heavy fruiter, beautiful color, and good size.

How to Set Out Orchards.—One gentleman wishes to know whether in setting out an orchard to use large or small trees. The answer is that a medium sized tree, with plenty of fibrous roots and a straight body, was to be preferred.

Salt for Potatoes.—A grower says that he has tried sowing one barrel of salt to the acre right after he had planted his potatoes, and considers it a good plan to ward against drought. He claims it held the moisture, and that his potatoes were perfectly free from scab.

Mistakes will sometimes be made. A short time ago I was talking with a fruit grower who had obtained, as he supposed, fifty Orange quince trees from a large nursery of established reputation for doing a square business. Only about a dozen trees proved (as they fruited this year), true to name out of the whole number.

CHAS. C. NASH.

Scrofula is a word you don't quite understand, but if you talk with your doctor, he will tell you that it is generally believed to be due to the same cause which gives rise to Consumption. It appears mostly in those who are fat-starved and thin, usually in early life. A course of treatment of Scott's Emulsion with the Hypophosphites wherever Scrofula manifests itself, will prevent the development of the disease. Let us send you a book. Free.

SCOTT & BOWNE, Chemists, New York.

**POULTRY BREEDERS!** Send 50 cts. for a 20-paged monthly devoted to Poultry, etc. Sample 6 cts. MICHIGAN POULTRY BREEDER, Battle Creek, Mich.

## GRAY HAIR MADE DARK

By a harmless Home Wash. Also makes the hair grow. Full directions and recipe for 25 cts. Mrs. A. MUNTLEY, 4215 Evans Ave., St. Louis, Mo.

## ALL THE LATEST NOVELTIES

AND PLANTS THAT CAN'T BE HAD ELSEWHERE. Cammas, Italia and Austria, at \$1 each. New Roses, New Fruits, New Shrubs, New Bulbs. 10 Cents for \$1.—5 for 50 cts. Book on Cacti 115 pages, 120 cuts, 10 cts. Catalogue of New and Rare Plants, Cacti and Bulbs free. A. BLANC & CO., Philadelphia.

Mention American Gardening when you write.

## A HORSE BUYER

He usually proceeds with caution. If a stranger should offer him a well known animal at a "cut rate" he would insist on a bill of sale from the former owner. Wise fence buyers who are offered the Coiled Spring article by other parties should ask to see a licence from

PAGE WOVEN WIRE FENCE CO., Adrian, Mich.

## 150 SUMMER BEDDING OXALIS BULBS

These bulbs make beautiful borders for summer flower beds, as well as attractive pot plants. The collection includes 150 Bulbs in equal proportions of the four following varieties, named, and in separate packets:

OXALIS DEPPEI ALBA.—White.  
OXALIS DEPPEI ROSEA.—Old rose or salmon.  
OXALIS ERYTHRA PURPUREA.—Purple.  
OXALIS LASLANDRA.—Crimson. Tall, fine pal-mate leaves.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

## Outside House Shutters.

In the interest of the plants, let all defects in the window blinds be carefully repaired. Many an old house must apologize with creaking, slamming shame for hinges gone, and catches worn past doing their rightful duty. If these catches cannot be replaced, a few hooks and staples may be so placed as to keep the blinds in position when open, and to render it an easy matter to close them when the plants require it. No man of ordinary temper will close the shutters for his *Dulcinea* if it is a matter of icy strings and cold blundering fingers. If the work is made easy, he may easily be persuaded to undertake it.

## Too Many Eggs?

What is the bugaboo that frightens the great majority of actual poultry raisers? Is it not under-production? Every effort is put forth to gain more eggs during the two or three months of the moulting period, and the three to five months of winter cold. We of the home plots are fully satisfied only when we can bring our flocks up (by means of mashies, clovers and vegetables, nitrogenous grains, meat, bones, and every possible device) to, or above, the pointed averages. Yet, strange to say, the would-be poultry raiser finds his strongest deterrent in the year of over-production! I talked with one such last week—a woman who had many sound ideas, and who was looking the ground over thoroughly. Yet more than a fear of her own lack, stronger than any fears concerning her fowls, were her fears as to a permanent, steady demand for the products. Groundless fear, this, especially when, as in her case, the location can be chosen, not merely accepted because it is a fixed fact.

## Window Carnations.

Marguerite Carnations are blooming right along in a sunny south window. The colors run very much to shades of a peculiar light red which is yet not pink. Still, from a dozen plants one may get nearly all the good colors, and some well-shaped, double blooms of good size. They are not, however, by any means equal in all points to the best of the greenhouse everblooming sorts; as the blooms of the Marguerite are usually of less substance, and last in perfection but a brief period, even in a cool room. But the fact remains that they have many claims to distinction as good plants for sunny winter windows in cool rooms. Garden-grown, they have been wholly free from red spider throughout the season to the present time, and this in a very dry atmosphere, and almost without showering.

## A Test of Patience in the Flower Lover.

"When I am 65, or thereabouts, and feel that I no longer wish to work very hard, I think I shall like to spend my time largely in experimenting with and hybridizing plants," said a young woman editor last week. "I like that, too," eagerly rejoined the second woman. "What line would you take up?" "I think Tulips offer a fine field, as there is so much pleasure in watching them change their colors, as the years pass, and they develop." "But, oh! they are so slow!" protested the other. "They take so many years to show what they will do." "So many years? What, then, of Orchids, which take often 15 years or more to come into bloom from seed?" "Ah! me; I could

never wait for them!" said the impatient one. "Two or three years seem long enough to wait, even for the best things." Ah! the patience necessary to the hybridizer.

## L. Candidum as Aphis Pasture.

Some may have wondered what especial traits in the *Harrisii* Lily have made it to be preferred over *candidum* for forcing. There is one point in connection with the latter which may well be considered, even though with careful treatment it may bloom as well in winter as *Harrisii* and *longiflorum*. This is the fact that aphides are so fond of it. Of all the plants in one miscellaneous collection, the most difficult to keep free from aphides is the *Candidum* Lily. The plant is thriving unusually well, hence it cannot be weakness that draws the pests.

## Seeds of Previous Years.

That we must buy some new seeds goes without saying, with all of us. But it is to be presumed that nearly every closet store has some home-saved or left-over stock. Sorting and listing these is a sensible preliminary to making out the new lists. Receptacles not mice-proof may indeed be found to be like comb without honey. Even if the seeds be all intact, let them be listed. Seeds like cabbage and its class retain their germinating power many years; others, like the umbel-flowered parsnip, parsley, and their relatives, fail quickly. Let us know what are the probabilities concerning the seeds on hand, lest we be left without some favorite herb or vegetable when its season comes on.

## The Wooden Hen.

The little illustration shown herewith is small only in size, but large in power, when we consider that the "Wooden Hen" is no larger than a live hen, yet has double the capacity, viz.: 28 eggs. Owners of a home

plot should write to Geo. H. Stahl, Quincy, Ill., and ask him for a copy of his handsome little booklet describing the "Wooden Hen," and also for his catalogue. Tell him you write at the suggestion of AMERICAN GARDENING.

## Re-arranging Plants.

If plants are kept chiefly for their decorative effect, it becomes a matter of necessity to re-arrange and replace rather often. Unless certain plants are especially selected for certain exposures, it is difficult to grow good plants. But by keeping those that must have sun next the glass in the sunny window, and those that require shade further back, or on the floor, one may do much toward good plants. Even this is not all, however, for as the plants grow they need to be moved to give better chance for others. In a miscellaneous collection, when one has placed each plant to receive the best that conditions may offer it, it is found that the effect from the room is anything but good. For this reason, a general collection fails often in a large portion of its mission. Flowers, of course, are beautiful wherever they may appear, but only special arrangement for effect can show all the beauty there is in them. After blooming, they need to be removed, others being substituted.

## That Pleasing Paralyzing Pie!

How good it looks! How good it is! ..... And how it hurts. Why not look into the question of **Pill after Pie?** Eat your pie and take Ayer's Pills after, and pie will please and not paralyze.

**AYER'S Cathartic Pills**  
CURE DYSPEPSIA.

## Begonias and Sunshine.

"Begonias now in bloom like a sunny position and a temperature of about 55° to 60°." The quotation is from the December calendar of an expert. This runs directly counter to the common belief that Begonias require much heat and little or no sunshine. What has something to say upon this head?

MYRA V. NORRIS.

Do you raise small fruits? No? Don't know just how to get at it? *The Rural New Yorker* will give you information about it every week in the year for only \$1, and your money back in three months, if you are not satisfied. We can send it and AMERICAN GARDENING, both one year for \$1.80.

## WHOLESALE MARKET REPORT

## New York.

Business in hothouse and fancy stock remains in practically the same condition as reported in last issue; but these conditions it is hoped will very soon be altered. Society events are now beginning to be more numerous, and a larger number still are expected for the forthcoming weeks, between now and lent. Growers of fancy and forced stock are also likely to benefit from the fact that there has been a heavy frost in Florida. This should especially benefit hothouse lettuce.

At time of writing lettuce is realizing very low figures, but much of the stock is only equal with southern grown, and consequently makes only the same price; plenty of lots sold at 50c. per barrel. Strictly fancy made from 20c. to 50c. per dozen.

Mushrooms are still selling at unprecendently low figures, and there is no relief of the overstock in sight.

Cucumbers are in good demand, the supply being very light; prices run from 75c. to \$1.75 per dozen, and a few made \$2.

Tomatoes sell at 20c. to 35c. per pound.

Radishes sell well, if quality is good, at from \$3 to \$3.50 per 100 bunches. These vary in count from eight to fourteen radishes.

Hothouse strawberries: No. 1, sell at \$4.50 per quart, No. 2 at 75c. per quart. Select fruit, Florida grown, 75c. per quart.

European grapes: 75c. to \$1.25 per pound.

Apples show no change from last quotations.

Consignments of fresh vegetables from Bermuda arrived in excellent condition. These included some very fine new potatoes, realizing \$6 to \$8 per barrel.

## Vegetables.

Tomatoes, Southern Florida, per carrier	1 50	3 50

## Philadelphia.

Business in both the fruit and vegetable markets is very poor, and in many cases the commission men report that growers are not getting any returns, after expressage and commission are taken out. This condition of affairs has existed now for the past three weeks.

Apples have been moving fairly well this past week, Spitzenburg being probably the most sought after.

Grapes are very scarce, and what few are on sale are not of good quality.

Florida strawberries are in larger supply; some fairly good fruit is now coming in, which sells at 75c. to \$1.25 per quart box.

Tomatoes from nearby growers are of improved quality, and bring 25c. to 30c. per lb.; second grade, 15c. to 20c. per lb.

The glut of mushrooms continues, 20c. per pound is the best price obtained, but the best quality produce goes direct to the large hotels, and for that a better price is obtained.

The supply of lettuce is far above the

demand; some of the Florida stock is not up to standard, and will not pay for the expressage. At the present state of the market it is useless to ship poor stock.

## Apples.

## One Way to Protect Small Shrubs.

Winding a bit of burlap tightly about the stalk and limbs of a shrub does not afford needed protection in winter—such a plan, in fact, affords very little, if any, protection. Straw or hay should first be put about the shrub in the manner shown in *a*, figure 22. Then wrap tightly with burlap and tie, as suggested at *b*. By this plan, the roots are well protected—often the very part of the shrub that most needs protection—and a body of heat kept inside the covering that is

FIG. 22.—THE WAY TO PROTECT SHRUBS.  
(See text.)

not easily dissipated. The form shown is also a protection against buffeting by the wind, as the big base makes the shrub immovable, and also keeps any weight of snow from resting upon the shrub. W. D.

## NUTS FOR THE LARGE PLOT.

That nutting is a delightful recreation during glorious autumn days goes without saying. The same may be said of the fact that most of the delight often inheres, and must inhere, in the outing and not in the uncertain captures of nuts. Why not have the nuts on the home plot? Competent authorities tell us that we can have them in bearing at three years old; that we can have them to ripen nuts as early as the first week in September; that we can have them six inches in circumference, if we plant the right sorts. If it is worth while to plant whole farms to nuts (as some are now contemplating), may it not be well worth while to have a tier or two on the home plot? The chestnut is a noble tree, and one or two would in a few years furnish a full supply for a good-sized family, even to the famous "chestnut stuffing," which cooking school teachers are so popularizing.

San Jose Scale in Ohio.—The dreaded San Jose scale is reported as having invaded fruit orchards in Catawba Island and the Marblehead Peninsula. Prof. Webster, of the Wooster State Agricultural Experiment Station, has been examining trees in the vicinity, and has advised the destruction of all affected trees, to prevent its spread to other localities. In accordance with his decision, many orchards in the island and peninsula region are being bereft of valuable trees, and in some instances the greater portion of fruit farms are being cleared. The loss will fall heavily on many of the smaller growers.

This little picture will come home with telling force to many a tired and overworked farmer's wife, who has often felt that she could not longer stand the strain and who finally succumbed to disease. Poor woman! Do you not know that there is within your easy reach a remedy that will quickly restore you to health and happiness? A remedy that will positively cure

## PRIVATE GARDENERS.

We solicit for publication under this heading notes on the work being done by private gardeners, changes in appointment, and all matters of interest to horticulturists generally.

### Death of William Elliott.

On Saturday last, January 16, the head of the seed firm of Wm. Elliott & Sons, New York, died. He was in his 73d year.

For nearly half a century the name of William Elliott has been before the trade, and his death, which had been expected for some time past, will cause many a one to recall the pleasant moments well spent in the company of a

tion of better prices for the growers of the stock.

William Elliott was originally a gardener; born of a race of gardeners, on Oct. 10, 1824, at the village of Crailling, near Jedburgh, Scotland. Having served his apprenticeship in the Earl of Minto's gardens, near his home, he became gardener for Sir J. Trevelyan, near Newcastle, England; then at Ripley Castle, Yorks. After a few other changes he went to London and was for two years with the firm of J. & C. Lee in their then celebrated Hammersmith Nurseries. Returning to Scotland, he entered the wholesale fruit business, but soon again took up gardening at Sawley Hall, Ripon, Yorks; thence to Skirvings Nurseries, Liverpool.

Elliott arrived in the States, March 1851, and was variously florist and gardener, and eventually leased a place a

FIG. 23.—THE LATE WILLIAM ELLIOTT.

genial friend, and to linger with fond recollection over the past. William Elliott was the last survivor of that coterie of the seed trade, who, so far as New York is concerned, connected the present generation with the beginnings of the interest now so large, and he was never tired of recounting to those who knew him personally, a wonderful fund of anecdotes concerning himself and others with whom his varied and long experience had brought him into contact.

To many of our readers, perhaps, it is as an auctioneer that William Elliott will be most familiar. When on the rostrum, his keen powers of humorous conception, coupled with the characteristic dryness of method, which is in the blood of the Scot, endeared him to all frequenters of the Dey street salesrooms, and not infrequently aided to the realiza-

Bergen Hill, N. J., where he started in as a market gardener; this venture proving a failure, he went to Canada with the intention of farming, but hastened back to New York, entering into the employment of J. O. Sheldon, S. I., and later of that gentleman's father-in-law, James McCall.

In 1854, Elliott bought the seed business of Hugh Orr; being approached by Isaac H. Young, the firm of Young & Elliott became established at 9 John st. In 1858, Elliott held his first auction sale (for Andrew Dryburg, of Philadelphia, Pa.). In 1889, Young died and the firm became as it is to-day, Wm. Elliott & Sons.

Mr. Elliott married the daughter of Capt. Carroll, S. I., and leaves the widow and four children, the two sons carrying on the business.

### Curator Dawson, of the Arnold Arboretum, on Tree Planting.

At the regular meeting of the Blackstone Improvement Society, of Providence, R. I., Jackson Dawson, Curator of the Arnold Arboretum, Boston, delivered an address on the subject of tree planting. Trees are rapidly disappearing from our cities, and few are replaced; in all the large cities and towns modern "improvements" are driving them out, and streets which two years ago were well shaded are now wholly treeless. It was time local associations saw to it that something was done either by municipal or legislative action to prevent the destruction of the trees; there are, of course, many laws for the protection of the trees, but they are rarely put into effect. Many trees are destroyed in the pruning so-called, by various companies which run wires along the streets, and many are ruined by being used as hitching posts. A house can be built in a few months, but it takes years of waiting and care to get a good shade tree. The study of botany has been introduced extensively into the schools, and the boys and girls should be interested in the care of the trees.

The work of beautifying country homes is being carried on to a large extent in all parts of the country. This cannot help but have a good influence in the surrounding towns. In the city of Washington there were few trees on the streets for many years, and what few there were on the thoroughfares were in poor condition. Nurseries were established, and a variety of trees planted and cared for, so that to-day there are many well-shaded streets.

In New York many of the streets are treeless, but this is to be expected in a city where so much business is carried on. Politics and trees do not go well together, but there is no reason why some provision should not be made for preventing the mutilation of trees in the streets. Attention was called to the organization of a tree planting society in Brooklyn, and to the well-shaded streets in Buffalo, N. Y.

### Oceanic, N. J.

The regular semi-monthly meeting of the Monmouth County Horticultural Society was held on Friday, January 15. The delegates who attended the "smoker," given by the N. Y. Florists' Club, were very enthusiastic over the affair, and had nothing but the warmest praise for the Club and its members. A resolution was adopted tendering thanks. As evidence of the high esteem in which the president, Mr. Butterbach, is held by his fellow members, he was recently presented with a beautiful gold-headed cane by one. Arrangements for a public exhibition, to be held in the early fall, are going steadily forward. The committee in charge promises a great exhibition. The report of the delegates to the Convention of American Gardeners was listened to with attention, and at its conclusion the Society unanimously ratified their action, and resolved to affiliate with the American Horticultural Society. The Society will have no more loyal supporters than those of Monmouth County. The next meeting will be held in the Fireman's Hall, Oceanic, N. J., on February 5, at 7:30 P.M.

### Lenox, Mass.

The regular meeting of the Lenox Horticultural Society, held on January 2, was the first of the nights for the programme of essays arranged by the Society. Mr. I. L. Powell, of Millbrook, N. Y., addressed the members on the subject of Herbaceous Plants and their Uses in Ornamental Gardening. On Saturday, 16th inst., Mr. P. O'Mara, of New York, spoke on "The Gardener's Mission in Horticulture." We hope to be able in a later issue, to refer at greater length to both these speakers' remarks.

### Poughkeepsie, N. Y.

The annual dinner of the Dutchess County Horticultural Society has been arranged for Wednesday, February 3d, next, at the The Nelson House, at 8 o'clock P.M. W. G. Saltford is chairman of the dinner committee.

## Twelve Everblooming Roses

Grower's selection from leading varieties.

Of all premium offers this is decidedly one of the most tempting and we fully guarantee its absolute reliability. Grower says: "We will fill your orders with strong well-ripened plants, grown specially for the purpose, from 2½ inch pots. This is our most popular collection and it has made hundreds of customers for us, as the testimonials in our possession will show." In this collection will be found such varieties as:

Perle  
F. Kruger  
The Bride

Virginia  
Snowflake  
Bon Silene  
Empress of China

Bridesmaid  
Pink Souper  
Flaman Cochet  
Prince Hohenzollern

Cornelia Cook  
Maurice Rouvier  
Catherine Hermet

The collection embraces a variety of colors, each plant is distinctly labeled, and the collection will make a beautiful bed. Packed in stiff, telescoped pasteboard boxes, oil finished on inside, and shipped to any address in the U. S. in good condition.

Orders for this collection can be filled at any time, but subscribers in the North and West are advised not to have their orders filled until April 1, or later.

## Potash

is a necessary and important ingredient of complete fertilizers. Crops of all kinds require a properly balanced manure. The best

## Fertilizers

contain a high percentage of Potash.

All about Potash—the results of its use by actual experiment on the best farms in the United States—is told in a little book which we publish and will gladly mail free to any farmer in America who will write for it.

# AMERICAN GARDENING CLUB LIST.

LET US FILL YOUR ORDERS FOR 1897.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

ADDRESS CASH WITH ORDER, AMERICAN GARDENING, P. O. Box 1697, NEW YORK.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\* \* \* We cannot undertake to reply by mail.

### Strawberries Under Glass.

[Strawberries transplanted from a nursery, a couple of months ago, and grown in pots in a conservatory since that time, are flowering now. What treatment should be given?—*Inquirer, N. J.*]

—Keep in gentle heat, watch out closely for red spider and green fly, and feed occasionally with liquid manure water.

### Mushroom Beds. Making Spawn.

[How long should horse manure and loam mixed together remain in a heap, being turned every second day, before it is ready for Mushroom Spawn? How and with what would you top dress the beds. How is the spawn got where it is sold, but how it is got? How long will beds put in now hold without being renewed?—*Inquirer, N. J.*]

—Manure is ready to be put into a bed at any time when you are sure the violent heat has passed away; the object of mixing loam with the manure is to modify the heat and enable the operator to get to work more quickly. We do not advise a very liberal use of loam in this way, for there is a danger of making the bed cold and soggy. The manure, when ready to make up into beds, should show no moisture when squeezed in the hand, and should be sufficiently elastic that it will rebound when the pressure of the hand is relaxed. In such condition it will generate a moderate and sufficient heat. After spawning topdress with a very light free soil, one that will not paste or bind when put on the beds; make the surface smooth with the back of a spade. When put on, the soil should be tolerably dry. How to make spawn? This is a subject outside our province, and we hardly care to enter into the details, not to guard trade secrets, but because such information will be of little service to our readers. The process is too tedious a one, and in a small way too expensive to be practicable to them. Speaking broadly, "spawn" can be made by mixing together two parts of cow dung, one part sheep, and one part horse droppings. The cows and horses from which the foregoing are obtained must be dry fed; they should not be fed with grass, nor yet with carrots. This mixture is well blended together, dried, beaten, and rubbed through a small meshed sieve; after that it is placed in a shed in a conical heap, and is either covered by stable manure or mats, whichever may be the best adapted to maintain a temperature ranging from 55° to 65° in the center of the heap. The time required to create the spawn at this stage will vary from four to twelve weeks. This is only the first part of the business; the next is to get it into brick form that use may be made of it. The material for making the brick is made up of various ingredients, but generally it may be said to consist of droppings from cows, sheep, and horses, with straw manure kept out; a fifth part may be made up with soil or road scrapings and a little coal ashes. This is all mixed together, with the addition of liquid manure water, and worked into the consistency of mortar. The mass is then laid on a smooth surface in a shed, and when dried to the consistency of plastic clay is cut out either by a spade or proper mold into the desired bricks. These are perforated with small holes. Then the drying process begins. The bricks are stacked in sheds adapted to the purpose in such a manner that there is a free circulation of air among them. When they reach the proper condition of dryness they are spawned. The temperature being warm, the spawn runs through the whole texture. Beds made up now should be exhausted by spring.

### Celery Rotting.

[November 15 I stored my celery in the garden, in a pit one foot deep and six feet wide, and thoroughly protected it from frost snow, or rain, and also arranged for ventilation in favorable weather; yet despite these precautions the celery rotted. Previous seasons I stored it somewhat differently, inasmuch as it was not bleached so much, relying upon the bleaching being done while in storage, allowing ample soil for the purpose. This season we did differently, and had the celery

thoroughly bleached first, with the result that we have had very rotten celery.—*Hastings.*]

—The reason seems to be very apparent. Evidently the celery was overripe before storage was commenced, and consequently not in a condition to keep any length of time. In preparing celery for winter use, first select a good late variety—for instance, Giant Pascal. Grow the plants to as full a size as possible, have them in a vigorous growing stage, striking a happy medium in not having them too green nor yet very much blanched. Such stock as this buried properly, with the tops free, bleaches very rapidly when stored, and yet with care will keep for a considerable time when protected from the elements. A batch slightly more forward than the last named should be available for present use, and that could be stored in a frame or any convenient place; in fact, with celery, as with many other things, judgment must be used in keeping up a succession or rotation of crops.

#### Dracenas in the Window.

(Do Dracenas require sunlight? do they require frequent watering and spraying? I have one D. Lindenii which I have kept at a north window, giving it the same treatment as a Palm, but for some reason the tips of the leaves are turning brown.—*Enquirer*.)

Dracenas require sunshine and warmth, and a moderate supply of water, but this last only when really needed; the soil in the pot should become moderately dry, and then a thorough soaking should be given. A moist sponge run over the leaves now and again is good, improving the appearance of the plant, and helping to keep the pores of the leaves free from dust. The brown tips complained of may have been caused by a chill at some time, too cold a temperature or even too much water at the roots.

#### Soil for Alsophila.

(To J. M., Ohio.)—Fibrous loam, broken by hand in order to keep it lumpy, a little rough charcoal, and a small portion of leaf-mold, together with a sprinkling of sharp sand, will make a good mixture for all the Tree Ferns. *Alsophila australis* enjoys a warm, moist atmosphere.

#### Grafting an Old Chestnut.

[Will you kindly inform me what variety of chestnut (Japanese or other) would be the most desirable to use for grafting on native trees 20 years old. The present nuts are small and I desire a large sweet nut, free from the objections of the Spanish (bitter skin) if possible, and one that is hardy and good yielder.—*XXX.*]

The largest and most reliable Japan Chestnut is the Japan Giant, though it is not so early as Alpha, Reliance, Superb and others. We would suggest he use a few grafts of each of the earlier sorts as well as the later ones. The Paragon is one of the best Spanish sorts, being of good size, a heavy bearer and quite early. The Numbo, Ridgely and comfort are also valuable varieties, being of good size and quite sweet. All the above named varieties can be grafted in the 20-year old trees with good success if the grafter understands his business. Chestnuts are not so easy to graft as apples and pears, and more care should be taken in grafting them.—*PARRY'S' POMONA NURSERIES.*

#### Travel Via The Savannah Line.

A number of fine iron steamships ply between Boston, New York, Philadelphia and Savannah. They are staunch and commodious. The hulls and decks are of iron and steel. The compartments are water-tight. The saloons are beautifully furnished and upholstered. Each ship is arranged for a large number of first-class, second-class and steerage passengers, and lighted throughout by electricity.

If you will write "Savannah Line" at Boston, New York or Philadelphia, they will send you a handsome illustrated book—something new, and a copy of *Savannah Line News*.

**3 NEW AND POPULAR FLOWERS.**

**New Star Petunia.** An ex-  
quisite variety for garden or pot culture,  
each flower having distinct white  
star-like stripes on rich purplish  
red ground. The flowers, about  
2 1/2 inches across, almost hide the  
plant from view for months.

**Double Calliopsis.** Hand-  
some double variety. Flowers golden yellow color, wine-maroon spots.

**Sweet Scented Pansies.** Have the perfume of the Vio-  
let; the beauty of the Pansy.  
One packet each of these New and Popular Flower Seeds sent by  
mail, postage prepaid, and three months' subscription to the

**AGRICULTURAL EPITOMIST****ALL FOR 10 CTS.**

The Agricultural Epitomist now goes regularly into the homes  
of over 150,000 Practical, Prosperous and Progressive Farmers of  
the United States and Canada, and is said by them to be the most  
Practical, Timely and Interesting Farm, Garden and Household  
Paper published. It treats intelligently upon General Farming  
and Stock Raising; tells how to make the Garden pay; how to  
raise Poultry; treats on Floriculture; and its Household De-  
partment, known as "Chatter Corner," is alone worth a year's  
subscription to any live household. This offer to furnish a  
packet of each of the above described new and popular flower  
seeds and three months' subscription to the Agricultural Epito-  
mist, all for 10 cents, is made for the purpose of introducing  
the Epitomist into new homes, believing that where it is read for  
three months, it will be found so valuable and interesting as to  
secure for us in nearly every case a yearly subscription, the reg-  
ular price of which is 25 cents. The money which we will receive  
from this offer will not be sufficient to more than pay for the ad-  
vertising, to say nothing of the Flower Seeds and three months  
subscription. Send 10 cents in silver or postage stamps,  
upon receipt of which the Flower Seeds and Epitomist will be  
promptly forwarded. Address

## Propagation of Carnations.

It is becoming to be more and more recognized by those who grow plants, that there is a large field for selection of stock, a principal that has been long accepted by the man who raises

just now how this matter bears relationship to the Carnation and to point out to those who are propagating from cuttings how to select their wood. The first matter is the selection of healthy vigorous stock plants from which to take the cuttings.

FIG. 23.—PROPAGATING CARNATIONS FROM CUTTINGS. (For references see text.)

animals. It is not only that a given portion of "wood" grows into a plant more quickly than does another from the same plant, but there is now opened up the large problem of constitution and vital force. It will then be not amiss to consider

If this be not attended to disease is more likely to get a foothold. Then, when planting out in spring, any diseased stock should be burnt, and so at all stages by selection of healthy stock a vigorous batch of plants will be the more easily secured.

There is a wide difference in the results from cuttings taken from different portions of the flowering stem, and this difference is not due to the location of the cutting upon any particular portion of the plants, but solely to the condition of the wood as to strength and vigor when put in the sand.

In the illustration (Fig. 23) these upper growth cuttings, as shown at 1 and 2, are well rooted and stronger than those at 3 and 4 on the same plate.

All these cuttings were placed in the sand at the same time. These cuts are most instructive, as here can plainly be seen that difference in vigor which marks the line between fine grown specimen flowers and poor ones. The vigorous, plump pipes have thrown out a generous bunch of strong fibrous roots and are ready to go right to work. Look at the thin threadlets dangling from the thin spindling cuttings. Is there any further need of argument in favor of the selection of strong cuttings for propagating? Those marked 1 show selected cuttings taken from a flat eight days after planting from the sand.

Now, having given examples of properly selected and properly rooted cuttings, let us get down to the details of how it is done.

Mr. C. W. Ward, the carnation grower of Queens, L. I., thus describes his method: I prefer to take the cuttings from the stem, either when the flower is picked or but a short time before, as the wood is then generally in the best condition to strike. By taking the cutting some time before the bloom opens a stronger stem and better flower is secured; but the cuttings are often soft and not as desirable as later on. If taken when the flower is picked it gives an opportunity to reject cuttings from flower stems that may show a disposition to sport or come ill-shaped or off color, and this affords an additional safeguard in selection of stock.

The points of the leaves are trimmed lightly, and the cuttings are benched in clean sand, being stuck in rows two inches apart and a half inch in the row, and thoroughly firmed in place. After this nothing is done save to keep an average temperature of 56 to 58 degrees day and night, and to give plenty of ventilation, keeping the sand just moderately moist. It usually takes twenty-one to twenty-six days for the cuttings to strike, though some varieties strike in twelve or fifteen days in February and March.

Bottom heat may or may not be used, but temperature under the bench should not exceed 60 degrees.

I do not care what sort of sand is used, provided it is clean sand (I have seen carnations rooted splendidly in a compound of loam and charcoal).

As soon as thoroughly rooted (as shown on the plate) the cuttings are immediately potted up or set out in flats. When potted, care is taken not to let them grow root-bound, and as soon as the first growth has filled the pots with roots the young plants are turned out and packed away in flats, with moss about the balls, and are then placed in cold frames till planting out time, which with us is from April 15 until June. We have planted out from sand bench in July with excellent results.

**Canadian Cannons.**—What to do with the overproduction was much discussed at a recent meeting at Toronto; some method of controlling output was advocated.

## Concerning Carnations.\*

(Concluded from page 35.)

In the matter of cultivation I would counsel everyone in actual practice to look after the small details which cannot now be touched upon, as the sum of ultimate success grows in direct ratio to the amount of attention given to what we are often prone to neglect as minor matters. Taking the more important details of culture in proper sequence we have first to consider the raising of a good plant, otherwise propagation.

### Cuttings.

If you would have the highest grade flowers a year hence begin now with select cuttings for stock. Choose for cuttings only healthy shoots from healthy plants. If you observe a plant with flowers deficient in size or color avoid it, and you will then have no cause to complain of deterioration of varieties in cultivation. After the cuttings are taken don't leave them lying around till the next day but get them into the cutting bed which should be for preference composed of good sharp sand. The cuttings need little preparation, but it facilitates rooting to shorten back the leaves by cutting off their tips. I used to think that the only advantage derivable from this was a slight check on the evaporation of the cutting's moisture, but an experiment with two batches, one tipped, the other not, demonstrated that the cuttings that had their leaves shortened rooted four days in advance of those not so treated. After insertion give them a thorough watering, shade from strong sun, maintain a temperature of about 50°, and one's own judgment must suggest what other attention they need till they are ready to take out of the sand and prick into flats.

### Seedlings.

There is another fascinating method of raising Carnations, that is from seed. Here again, haphazard work is of no account. A law of nature shows the "like seeks to beget like," but in the Carnation there is a latent possibility of wonderful degeneration at one remove. A chart which shows the rocks and shoals enables the captain to navigate his ship through dangerous waters in safety. Let me indicate a rock upon which my Carnation raising efforts once foundered and were stranded for a whole year. I had a very fine collection of Carnations flowering in the garden, and there was not even a second-rate kind among them. A score of varieties in groups of from 50 to 100 plants of each represented a rigid selection from 100 kinds tried the previous year. I noticed many of them were forming seedpods, so I selected some, watched them daily unto the ripening, harvested good seed, sowed it the following spring, and in late summer planted out for next year's blooming 2000 as good plants as anyone would wish to see. I anticipated a grand series of seedlings but realized a tremendous setback of my hopes. Twenty-five per cent. of the progeny went right back and produced single flowers. Fifty per cent. of the remainder were double but not as good as their parents.

A few of the remaining plants were selected and grown the following year, but the Carnation world is none the richer for that attempt to increase its wealth. Profiting by this stern lesson I went to work again but resolved to trust to no chances; I carefully crossed the flowers chosen for seeding, hand fertilizing every one, and secured a number of fine pods of seed. The seeds were sown, good plants obtained, that ultimately came to the flowering stage. In this batch of 200 plants only two plants produced single flowers, the rest were as good as their parents, and reds predominating in the seed parents, there was in the progeny the finest series of red seedlings I have ever seen. Quite a number were selected for another year but I handled them no longer. I do know, however, that a few of them are still in cultivation, and one or two of the finest were named and distributed.

There is here ample proof that if you would raise fine kinds you must select the

parents and work with an object in view. The new kinds offered us each season by specialists are the outcome of the same careful crossing and systematic working on the part of their raisers. Even then, however, the blanks are many, the prizes few, for though one is apt to look kindly upon the results of one's own endeavors, when they come to be judged by the standard of existing things, there is often a very rude awakening, and you find some of your handsome swans are only ordinary geese after all.

### Novelties.

The only justification for putting another kind on the market is either the possession of qualities superior to those of the variety it most resembles, or if unlike any on the market, it conforms with them in every other point that goes to constitute the existing standard of highest merit. One Carnation or one Rose has sufficed to bring fame to its raiser, and hand his name down to posterity in grateful remembrance.

### General Treatment.

Getting back to the young plants that are raised from cuttings in the yearly routine, the aim of the cultivator in summer should be the growth of a strong plant, calculated to yield the fullest possible crop of winter bloom, and this is best accomplished by planting out the plants in the open ground at such time as the season and locality warrants, May usually being a favorable month. The summer site and soil for the plants are important matters to consider. I remarked at the commencement that the wild Carnation grows up high and open, where it never suffers from a superabundance of moisture, and enjoys a free circulation of air always. Just as much does the cultivated Carnation want an open, airy situation and a free, well worked soil of medium texture, neither too adhesive nor too gritty, well enriched but not with fresh rank manure, which is peculiarly distasteful to the plants. If Carnations can be planted in succession to some crop for which the soil was previously well manured, it will be found quite rich enough, all it needs being deep digging or plowing of the soil. If fresh food for the plants be absolutely essential at planting, give it in concentrated form, as for example, bone meal or wood ashes, separate or in mixture, both are first-rate Carnation manures.

After planting the chief details of summer treatment are keeping down weeds by frequent cultivation and pinching the main stems as they advance in length. The ideal plant to try and secure is one of low and tufted growth, with from 6 to 8 shoots as near the ground as possible.

If one have a large quantity of plants it may be desirable to spray them with sulphate of copper once a week, since prevention is better than cure, but in private establishments, with but a limited number of plants, due selection of cuttings and proper care for the infant plants bring their reward in a comparative immunity from fungous diseases. Soil that will grow good Roses will likewise grow Carnations, so it is needless to enlarge upon the preparation of the compost heap wherefrom to fill the benches.

Lifting from the ground and planting on the benches can begin with safety in August, indeed, I am informed by one of the best growers that he likes to get all his plants planted on the benches in that month. This grower further advises what I would have hesitated to practice, the shaking off entirely from the roots all the old soil in which the plants grew in the field, as they thus start the more readily in the fresh compost. The quality of his stock warrants me in concluding that his practice on this point is sound.

With bright hot weather prevailing in August, slight shade and free syringing will be important factors towards future good results; but when the plants show evidence of getting established less overhead moisture and abundance of light and air should be given. When flowers begin to push up the quality and quantity of them will be in proportion to the individual skill that supplements the initial work along the lines indicated. Given a light house that receives every possible ray of direct sunlight during the winter months, and an equable temperature of 50° to 55°, the chief winter items of labor are disbudding, watering, syringing.

\* Paper by A. Herrington, Madison, N. J., read before the Morris Co. (N. J.) Horticultural Society, January 13, 1897.

## Some Notes on Fruits.

**MANNING'S ELIZABETH PEAR.**—In one of my exchanges I find some favorable comment upon this exquisite little pear, the Manning's Elizabeth, and it reminds me of the fact that this variety seems to give us a crop even in most unfavorable seasons. Two years ago, when late frosts killed almost everything in the shape of pears in our orchards, so that we did not have Bartlett's enough for home use, and hardly Duchess enough for a taste, and when most of the pear orchards in the vicinity were almost entirely bare of fruit, our Elizabeth hung laden, so that limbs were bending down almost to the ground. This pear is described by J. J. Thomas as follows: "Small, obovate, Seckel form, smooth; surface yellow, with a lively blush; stalk one inch long; cavity round, shallow; flesh very melting, saccharine, sprightly, perfumed, excellent. End of summer. Shoots diverging, dark reddish brown; serratures of the leaves very slight, Belgian."

The accompanying illustration shows shape and size of the Elizabeth, which to me seems indispensable to a well calculated family orchard. It ripens here in August. Possibly it may prove to be a good pear for market also, but we have had no experience with it as a market fruit.

**MOST PRODUCTIVE STRAWBERRIES.**—At the recent meeting of the Ontario Experimental Union, held at the Agricultural College, Guelph, Ont. (Canada), Prof. H. L. Hutt, the experimenting horticulturist of the institution, gave a report on the results of the recent experiments with strawberries grown on the College grounds. He has observed an extra growth of plants as a result of the careful removal of the blossoms the first season. This only confirms our old experience, that in order to secure the heaviest crop the second year (which is the main and usually the only fruiting year, as strawberries are handled by good growers), we have to adopt the practice of preventing all fruit setting the same season that the bed is established. Then in order to have a full crop, we must have full matted rows. With varieties that are good plant-makers, like Wilson, Crescent, Haverland, Bubach, Warfield, etc., we have no difficulty in securing the full stand of plants, in an average fair season, even if in starting the bed we put the plants 2 feet apart. This is the distance which Prof. Hutt recommends for planting such sorts, while 18 inches is as much as poor plant makers should be spread apart in the row at the start.

Next, for a heavy yield, we want the heavy yielders. Among them, Warfield was found to be at the head. Afton is much like it. Warfield has a good leaf and a very firm berry. Haverland is one of the best for home cultivation. Bubach was the 18th, and Crescent the 20th, in the order of best yielders. Haverland was found at the head in general health and power to resist rust. Among the perfect flowering sorts (those named all being pistillates), Saunders was found first in productiveness and vigor. Prof. Hutt prefers to grow the imperfect and perfect bloomers in alternate rows, in order to insure full fruit setting and therefore best yield. The question is what varieties to plant together. Haverland was the first to show bloom. Van Deman, a perfect-flowering sort, is also an early bloomer, and might be used to furnish pollen for the other. Lovett's Early and Gandy bloom soon after these, and, in a pinch, might be used for the same purpose.

Haverland and Warfield are among the earliest to give ripe fruit. Rio stands second in the list, although it stands 43d in the order of yield. Michel's Early stands third for early, and gives a large yield for an early sort, but the fruit is small and soft. Warfield stands fourth for earliness, and is the great berry for the West, and for heavy land and plenty of moisture, but seems not so good for light, dry soils. Among the latest varieties, Prof. Hutt mentioned Edgar Queen, Equinox, and Mrs. Cleveland.

## Will Bees Destroy Grapes?

There has been in the past, and still is, and I suppose always will be, a difference of opinion among well informed fruit growers as to whether the honey bee actually destroys ripe grapes without any outside assistance. At almost every meeting of the State Horticultural Society this question comes up, and like the old notion of wheat turning to cheat, one man is positive that it will and another is equally certain that it will not. Neither has any positive information on the subject. In order that we might have some reliable data on this question

FIG. 24.—PEAR MANNING'S ELIZABETH.

some careful observations were made during the past season.

A Worden grape vine, well loaded with fruit, was selected, and when the fruit was ripe all defective berries and surplus leaves were removed, so as to allow of the free movements of the bees. A colony of Italian bees was then placed close to the vine, and the whole enclosed with mosquito netting, giving the bees about 300 cubic feet of space in which to work. They were kept confined with the grapes just 21 days, and in the meantime were not allowed to get any other food to eat except the grapes, and what they already had stored in the hive. At the end of the three weeks they were removed and the grapes carefully examined, but it could not be discovered that a single grape had been injured.

The natural inference is that if the bees could not be induced to eat the grapes when kept in close confinement with them, they are not liable to injure them when at liberty to seek such food as they like best.

We all know that certain wasps will cut the skin of grapes, and I have always held to the opinion that the wasp was the culprit which first opens the door for the bees to get in. This opinion

has been confirmed the past season by seeing two species of the genus *Polistes* light on the grapes and with their sharp jaws tear open the skin and suck the juice. After this was done the honey bees would usually finish the work. In fact it would be a very stupid bee that would not avail itself of such an opportunity.

La Fayette, Ind.

J. TROOP.

## The Fruit Garden.

**Peaches.**—Yes, everybody is glad to see them in the market, from the large fancy grades from California to the wee hard bits offered in the last days of the season. Everyone wants them, and will examine and compare the different grades with more interest than is shown about any other fruit in the market. There are grown and put on the market so many varieties that are so similar in appearance to the non-professional grower that I, for one, have wondered whether or not there had been a mistake made in the nursery, or whether there were some points of difference in the fruits which I could not see. I had Smock and Wonderful, but failed to see any difference between them. Another time, I bought Early York, Hale's Early, Crawford's Early, Crawford's Late, Yellow Rarieripe, and Late Red Rarieripe. In course of time I found there were more than six kinds, so I tried to find the kinds to suit the table, but failed. Then I tried to find the names from the catalogues, and without satisfaction; so to this day some of them are waiting to be named. Others I have which are very distinct and good: Mountain Rose, white flesh, medium size, of good quality and color; the fruit does not shake off easily. River's Early York, ripening directly after Mountain Rose, is a picture peach, ground color creamy white, with tracings of delicate red covering almost the entire fruit, deepening on the sunny side, flavor first-class, tree vigorous. Another good peach is Grosse Mignonne, not often heard of, but worthy a place in the fruit garden. After River's Early York, we get Old Mixon, Stump, and Red Rarieripe, the last a handsome fruit, white flesh, melting and sweet, of good flavor.

**Everybody's Peach.**—The Crawford's Early and Late come along and continue with Morris White until Wonderful is ready in early October. The trees are good growers; the fruits I do not consider of any special note, except for lateness. So far, I have not been successful in getting good fruits from Steven's Rarieripe or Susquehanna; perhaps younger trees in better situations will give different results this season. One may experiment quite some with peaches, without feeling at all sore if the trees do not turn out just what he expected, and when good trees can be bought at 10 to 12 cents each, I wonder that country people will not try to find room for a few trees of their own, instead of buying from the stores skin and pits with very little flavor. For in order to know what flavor a peach really has, it must ripen on the tree and be eaten shortly after. A Late Crawford, nine to ten inches in circumference, taken in such a way, will hold its own against any fruit in the garden. By the way, these are not fancy figures, but actual measurements, so reader go ahead and do likewise.

J. HOLLOWAY.

**Money in Berries.**—Experience teaches that, although prices may be low, if a person has a good practical understanding of the berry business (learned by actual practice), he had better stick to it, as it will pay as well or better than anything else.

## The Vegetable Garden.

**Roots in Cellars.**—Whenever possible look these over, some may be decaying and should be thrown out.

**Beet Roots.**—If there are any small beets 1 inch in diameter, they should be sorted out, set apart in a cool place, covered with sand, and planted out in sheltered corner early in spring, the young leaves quickly grow and are fine for greens.

**Brussels Sprouts.**—The old stems and roots of Brussels sprouts and cabbages, if buried in soil before frost, are also useful for greens; if planted out early they will give dishes of greens before anything else.

**Potatoes.**—All the potatoes should be looked over now, those intended for seed should be selected, kept cool and dark.

**Cabbage.**—Make a sowing now for early, we prefer Early York for this purpose. The Jersey Wakefield is a general favorite.

**Cauliflower.**—Good heads of cauliflower grow only in cool, moist weather, in rich soil. A sowing of Early Snowball should now be made in flats in moderately rich soil.

**Lettuce.**—A sowing of Curled Simpson, or Golden Queen should be made every two or three weeks, to be ready to plant in hotbeds and in the garden later on.

**Tomatoes.**—By sowing now a strain of an early variety, as Perfection, Early Ruby, and growing on unchecked, and when a pair of true leaves are seen, transplanting 3 inches apart into flats, and later potting and kept growing as near the glass as possible, well aired at every opportunity to induce a stocky growth, an early crop will be secured. We allow only one stem to a plant, pinching back all laterals, staking as soon as needed, grown thus and kept at 55° night temperature, there will be fruit setting when planting out time comes. About June 1 we set out against a wall with southern aspect in unmanured soil, but use a sprinkling of bone dust and wood ashes, well incorporated with the soil before planting. In this way we generally pick tomatoes very early in July.

**Early Celery.**—Those who can command a few hotbed sashes can easily grow and blanch celery fit for the table by July 4; by making a sowing of the White Plume celery now in a flat, and as soon as they are fairly up, thinning out to 1 inch apart, and when 2 inches high transplanting direct into hotbed 3 inches apart each way. The hotbed should be at least 2 feet in depth. Procure enough fresh horse manure (not too much straw) to make the desired size bed, turn over a few times, breaking up any lumps, and throw in a heap to heat; when hot make the bed. The bed should be one foot deep after tamping it evenly and compactly; on this put 6 to 8 inches of good rich loam; if dry it may be lightly trodden down. In this bed the plants are set as directed, water of about 90° is best to water with during the cold weather, put on the sash, and protect from frost, ventilate judiciously whenever the temperature is above 45° outside. By May 15 the plants should be growing rapidly, after which the bed will practically require irrigating. As soon as the plants touch each other, they should be thinned out to 6 inches apart each way. The surplus plants should be planted out in the open ground for succession. When the weather in May is warm the sash may be taken off entirely. By this method plants grow so rapidly and shade each other when fully grown, that they blanch without further effort. It may sometimes be necessary to put an additional board on the outside of tops to aid blanching.

W. M. EDWARDS, R. I.

## The Forcing House.

**Asparagus.**—It seems to me that this choice vegetable, being so easy and simple to force, should be grown in every garden where there is glass at command. Asparagus can be grown successfully under the benches; it is not necessary to take up valuable bench space. There are a few points of management worth noting: first, the bed or beds, intended to give the stock for forcing, should have strong crowns; second, cut lightly from the patch in the previous spring. An important item in forcing roots is to make sure they get some frost, if possible, before bringing them into the forcing house. Asparagus can be forced without freezing, although the results will not then be so good. It seems strange that one so seldom can find a place where asparagus is forced. The roots should never be allowed to suffer for want of water; without a liberal supply results would be poor.

**Tomatoes.**—The difficult part of our winter has passed in regards to this crop, and the fruits should set freely from this date on by just giving the vines a shake now and again. Any one who has plants in, say, 3 or 4-inch pots should set them out in the bench at once, and a useful spring crop will result. I have always had a good word for the old Lorillard tomato, and have yet. However, Lorillard must take a back seat against Sutton's Best of All. We have the two fruiting here side by side. In growing

FIG. 25.—HAULING APPLES FROM THE CELLAR.

tomatoes under glass, we want the very best variety for that purpose, as there is a great deal of expense attached to forcing. Sutton's Best of All is a free setting tomato, fruit of fine shape and good quality, and without a doubt a long way ahead of Lorillard. It is well named.

W. TURNER.

## Taking Apples From a Cellar.

The usual storage place for apples is in the cellar. The barrels then have to be carried up the roll-way by two men—a matter of no little difficulty when the roll-way is narrow as is usually the case. A plan is shown in figure 25, by which the barrels of apples are carried to the surface with but little lifting, and without jarring the fruit. The diagram tells its own story, except that the triangular truck that is mounted on two rollers, is represented larger than need be, thus making it higher than is actually necessary. The rollers run on a wide plank that rests on the edges of the stair treads. The same arrangement will be found equally serviceable in putting apples into the cellar in the fall, and for use with vegetables, etc.

**Stored Apples.**—A Michigan fruit grower stored some apples in barrels lined with newspapers. Upon opening barrels that had been packed for a long time, he found that in those unlined, more or less of the fruit was decayed, while in the paper-lined barrels the apples were sound and in fine condition.

## Grounds of a Florist and Gardener.

Scattered over our land are many small farms, the owners of which devote their land to the culture of fruit and vegetables more than to farm crops. In not a few instances the same men take a hand at raising produce under glass; it may be vegetables, flowers or plants or a combination of these. It is not difficult to understand why such cases are; in the first place, many a man derives a larger income from twenty or thirty acres conducted along horticultural lines than others, who pass for good farmers, do on areas five or ten times as large, but devoted strictly to farm crops.

It is easily seen how a man, having begun with fruit and vegetable raising, on a small farm, will, with good business qualifications, also tend toward the greenhouse business. Broadly speaking, it is because fruit and vegetables are growths of the summer; produce under glass growths of the winter. In other words, the active business brain prefers to be at producing and selling the whole year round. With good management he frequently finds that the winter crop is the more profitable one; it in a considerable measure utilizes capital and labor, in teams, tools, etc., that otherwise would be idle and unproductive.

The man who is thus thrifty in his ideas as regards managing a fruit, vegetable and, perhaps, greenhouse business, is a man usually who has an appreciation for a fine home and place of business—for this the home becomes in a sense. Such is, or should especially be, the case, when it is seen that by some attention to the appearance of the grounds ornamentally the plantings may likewise serve in a measure the end of utility. For example, evergreen trees, such as pines, spruces, hemlocks, etc., while, on the one hand, they may serve to impart a fine ornamental effect, yet their value in breaking the wind, and thus in conserving the heat of a home and of stables, greenhouses, etc., may be measured very distinctly by dollars and cents in fuel saved. This is a point that is not always recognized in favor of such planting as it should be. One reason why this is the case is because the same person cannot be in two places at the same time to note the actual difference in effect of the presence or the absence of masses of evergreens and other trees that are serving as wind-screens.

In the accompanying sketch I am able to show what one horticulturist has succeeded admirably in doing, in combining the ornamental with the useful on his farm garden of twenty-seven acres. If the plan of his grounds will not fit that of others who are similarly situated, at least the latter should be able to draw numerous helpful hints from his example.

The home referred to is on the east side of the street, the dwelling A facing west. The front drive B, after entering the place, makes a graceful curve first to the right, winding around the house as it were, to give it a fair setting of lawn; then turns to the left, reaching the carriage house C and the barn D beyond. At K the drive continues by a straight course down through the farm to its furthest point.

The most prominent feature in the way of buildings is the greenhouse range, consisting of four long houses and one shorter cross house at the further or south end. There is a

potting and furnace room at the north-east corner, in the direction of the carriage house C. At F is a well and tank tower, the latter containing a small kerosene engine that pumps water into the tank above. From the tank pipes lead not only to the greenhouses but to the frame yard II. The tank is elevated about twenty feet, giving sufficient head to water the entire glass and frame department therefrom. The terminal distribution is from hose and nozzle, which here is connected with stopcocks at suitable places in the piping. JJ are small plats into which lettuce and other early crops or greenhouse stock are

on the north line consist in the main of evergreens. The one mass nearest to the street is planted to Norway spruces principally; the larger one further back to pine trees, including the Scotch chiefly, with half a dozen each of the Austrian and white, the latter being toward the home end of the mass. This was well conceived, for, while the Scotch pine costs less as it comes from the nursery, and grows to an effective size as a wind-break sooner than the others, yet it is less pleasing to the eye than either the Austrian or the white species. The place for the latter, therefore, was in the direction of the home.

FIG. 26.—UTILITY AND ORNAMENT COMBINED. (See text.)

planted. LL and beyond represent the garden and orchard lands, the latter consisting of ten acres. Only about one-fourth of the farm is brought into the present map. The manure yard is beyond the barn D.

Leading from the entrance at B is the front walk of the house, which extends to the veranda steps and thence to the side steps. To the latter there comes a shorter walk from the drive also. A third walk leads from the rear door to the drive near the greenhouse.

The plat G to the left of the drive, and on which the home is seated, is embellished with the twofold purpose of ornament and protection. The two larger masses of growths lying next

Together these masses of evergreens are very effective to the eye, while they serve to break the north and northwest winds from the house and the greenhouses and give some protection to the barns. The two trees between the groups named likewise are Austrian pines. The remaining growths in this plat and between the house and the drive are chiefly deciduous trees and hardy flowering shrubs. The latter, comprising Weigelas, hardy panicle Hydrangeas, Spiraeas, Forsythias and others of the class, are placed in small groups, as shown. Some flowering shrubs and tender bedding plants were growing in the evergreen beds near their margins when the writer visited the grounds.

On the opposite side of the drive in plat H there is a large open lawn, and with trees and shrubs of numerous kinds situated toward the margins of the plat. Here the owner found the opportunity to introduce enough variety into the collection to give a constant display of bloom and other attractions the season through. The selection consists mainly of deciduous kinds—that is, such as drop their leaves in the fall. A few spruces are introduced, however, toward the outside of the larger mass, with elm, maple and other large growing deciduous trees interspersed.

The beds to the north of the greenhouses are occupied during the summer with stock plants from the greenhouses. The space marked I, beyond the opposite end of the greenhouses, is likewise devoted to tender plants during the summer.

Thus the place stands forth as a handsome, well-balanced garden, a source of both profit and delight to its owner. It is fitting that men who love horticulture and derive their profits therefrom should be leaders in showing what grounds in the country are capable of in the way of improvements as well in the ornamental line as any other.

ELIAS A. LONG.

### Purchasing and Growing Cannas

Which is the best way to purchase Cannas, dry roots or young potted plants? Give directions for starting dry roots, soil, size of pots, temperature, moisture, etc. Can they be safely sent by mail through the winter time? If you wanted to plant in open ground May 15, at what time would you begin to pot them so as to have good, strong plants?—MAUD.

Any one possessing a greenhouse would do better by buying dry roots and starting them for themselves; there is then the chance of multiplication. Roots can be started by being placed on the bench and lightly covered with very light soil. Or they may be kept in small flats and treated in the same way; but if potted up use only the smallest possible pots. Whichever way the roots may be started, care must be taken that the soil does not become sodden or sour, yet at the same time the roots must be kept in moist soil, hence the advisability of using very free soil, so that the drainage may be ample. A temperature of 60 to 65 degrees, with a little rise in the daytime, is the most suitable. A lower temperature will do, but the growth would not be so rapid. When growths start up take them off and pot up in ordinary potting soil, using a small pot, and when the plant needs it give a shift. Water freely as the plants require it. When in the final shift the pots, which should be four to six inches, are full of roots and the growths are nice and strong; then reduce the temperature in order to prepare them for outdoors. Planting cannot be done safely until there is absolutely no fear of frost and the weather has become fairly warm. The Canna is a heat-loving plant, and there is no advantage in early planting if there be any danger of cold weather. Roots sent by mail now are liable to injury if frost touches them, but if they can be so packed that that will not happen, they may be mailed or shipped any time. They are being shipped freely at this time among the dealers and are being started in the greenhouses right away for spring trade. But good results can be obtained by starting any time from now till May.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1906.

PUBLISHED BY

A. T. DELAMARE PTO. & PUB. CO. LTD.

ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.

Telephone, 3154 Cortlandt. P. O. Box 1697.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

Eastern N. Y. **ORGANIZE!** was the watchword of Eastern New York fruit growers at their meeting at Cornwall on Monday last.

AMERICAN GARDENING hails with delight the true earnestness and business zeal which pervaded the meeting, and furthermore, extends its sympathy to the project, and stands ready to assist in every possible way. The necessity for such an organization is only too apparent when we look at the grand work being done in another part of the State by the Western New York Society.

The Hudson River Valley and adjacent parts teem with fruit growers, every branch of the industry is represented: small fruits, strawberries, peaches, grapes, apples, and pears, also ornamental horticulture; and behind all this are men whose intelligence and skill rank second to none, for from their section come some of the choicest grades offered for sale. With such conditions the reasons for organizing are obvious; the wonder indeed is that it has not been done years ago. However, on the lines of the old saw, "Better late than never," it will be accepted now.

Never before in the country's history were men so much inclined to get together; everywhere it is the same, and every line of business is doing it. Continued depression and low prices,

together with keener competition from outside, make it imperative that sections and districts get into close touch with each other, otherwise there is danger of the whole industry falling in disuetude and being wiped out. This being so, it demands not only the active interest and organization of the growers themselves, but of the whole community.

There is a great deal in a name in the New York market; and from time to time, owing to this fact, there is sometimes a transfer of trade from one section to another. We need mention but the two items of celery and lettuce in this connection. Then again, it is always found in markets, that the greater the supply and the cheaper the market, the more careful do packers and shippers need to be. And that is precisely the condition of our New York and other large markets to-day. Packing and shipping are most vital questions of the hour, and who can better deal with such a problem than a large well equipped, influential Society, such as the proposed body is likely to be?

As was mooted in the meeting, the day is passed for shipping twenty-five pounds of grapes in a forty pound crate, and before they are ripe, too; or apples with a few decent fruits on the top and nothing but culls below, and so it is with all other fruits. It is such tactics, followed by only a few growers perhaps, that give a district a bad name; and it is just such conditions that a live society will try to prevent. There are the questions of uniformity of packages, the commission man, the extent of the crops; the ever perplexing problems of freight and express rates, and delivery; all this and more can be treated with much better through organizations than through individuals.

Anything that will suggest any amelioration of the present distracting condition of many of our horticulturists and gardeners is heartily welcomed by us. Thus we again extend our best wishes for the future of the Eastern New York Horticultural Society.

W. F. TABER did well as temporary chairman.

THE SPIRIT of the meeting was good—just what was wanted.

T. J. DYER set the ball rolling in great shape, and so kept it going.

THE WEATHER was at the zero mark, but the delegates were, many of them, red hot with zeal.

THE COMMITTEE of thirty, appointed to meet at Poughkeepsie possibly next week, is a representative one, and good results are to be expected from its deliberations.

HINTS at THE PROBLEMS that will have to be worked out by the contemplated society; Mr. Passmore seeks information about fertilizers, also wants the package question ventilated. So do we.

THE YOUNGEST MEMBER present, B. D. Van Buren, Stockport, Columbia Co., N. Y., was the primary means of bringing so many fathers of the profession and wise heads together. All honor to his youthful ardor.

J. W. BINGHAM, Marlboro, N. Y., would have the Society take up the matter of

freights. He would also have it take a turn with the commission man, and settle with that gentleman such points as returning crates, etc.

H. W. COLLINGWOOD did wisely in publishing Mr. Van Buren's letter, calling for the meeting, also in his opening remarks setting forth the object for which all had met. He deserves credit for the good work he has already done.

THE SHORT HISTORY of the late Charles Downing by Mr. Westervelt was excellent, and accorded with the spirit of the meeting. If there be any communion of saints that noble soul must have been gratified to think that so near to the scene of his earthly labors such an organization as he had prayed for was being gotten into shape.

THERE WERE SIXTY-ONE present at the first meeting. This shows the interest taken and many of the gentlemen had journeyed long distances, and at great inconvenience to themselves; but apparently distances and intense cold are no obstacles to a Hudson River Valley or Eastern New York Fruit Grower when he makes up his mind to accomplish anything.

FULL OF ENTHUSIASM was E. G. Fowler, and made a grand speech encouraging those present to go on in the good work, so well and so auspiciously begun. His was a trite and pointed answer to a gentleman who wanted to know what he (Mr. Fowler) would do if he had to sell grapes below cost of raising, and apples below cost of picking and barrels. "Why, do just what we are trying to do now, organize, organize, try to better such a state of affairs, and endeavor to get growers together, that they may look after their end at least."

E. VAN ALESTYNE, Kinderhook, Columbia Co., N. Y. (secretary) spoke well and to the point. His advice to organize thoroughly and to make haste slowly was well timed. The subject, he said, had been broached years ago, but the fact that all concerned were so anxious for success was the reason it had not started. The times, he thought, were now propitious, and he welcomed the advent of such an organization; it could do a great deal it would enable growers in the Hudson River Valley to get better posted on the possible crops to be put on the market, and members may be guided thereby in the disposing of them; they may also be better able to get in line with the commission man, and perhaps be able to avoid overstocking the market (instancing the results attained by Illinois men); they may be better able to deal with express rates; anyhow it would tend to bring out the district and make it of more commercial importance on the market and among the great fruit-growing centers. They must meet often if to be of service to each other; annual meetings only were no good.

LAST BUT NOT LEAST.—Those who had charge of the meeting knew how to properly recognize the press and treat it rightly. They displayed good judgment when they put representatives of the leading agricultural and horticultural papers on their committee.

The Tobacco Industry.—"It's an ill wind that blows nobody good." The Cuban difficulty is giving an enormous impetus to the cultivation of tobacco in this country. Florida is getting the bulk of the business for the Cuban leaf; North Carolina will produce the much desired yellow leaf. A fortunate discovery has been made in a district where the soil was considered sterile and of no value, that this grade of leaf can be produced in the choicest quality. The state of Connecticut will also receive its share of benefit in supplying the demand for wrappers.

## Money Methods in the Market Garden.—IV.

### Fly Irrigation Plant—Liquid Manure for the Garden.

Every gardener appreciates the value of having water available for irrigating at any time. If dependence be placed upon the usual rain, the best results will not always be obtained, for though he supplies to the plants all the food necessary, yet without water it remains in an insoluble condition in the soil.

For several years a drought in June has shortened my crop of strawberries by about one-half of what it should have been. I therefore looked to irrigation. My truck farm is well situated for the purpose, by having a large brook running through it, so as to divide it into two almost equal parts. The bed of this brook is from four to eight feet lower than the garden surface. The question arose as to the best means of elevating this water so as to be able to use it for irrigating purposes. A windmill was too uncertain and an engine too expensive, and it was finally decided that the hydraulic ram would most economically raise the water. One of the largest rams, with a fall in the drive-pipe of about six feet, was placed in the brook; near the ram and on the highest bank a large tank was built of pine planks, and at a height sufficient to supply force to carry the water over the whole garden. From this tank iron pipes were laid in different directions, on the surface of the ground. The pipe was put together by means of T couplings which had the third end fitted with iron plugs, which could be unscrewed to allow a hose attachment at any place where it was wanted to use the water. This ram will elevate several thousand barrels of water in twenty-four hours.

This water is usually distributed over the garden at night, and may be applied either through a sprayer or allowed to run in a stream as desired. I do not think this method of applying water with a hose is the best one, as with surface irrigation the surface of the ground will sometimes bake. Sub irrigation is better, and I intend to substitute the irrigating tiles as soon as possible.

One object which I had in view in building the water tank was to dissolve in the water there some fertilizer, and feed it to the plants through the pipes. So far there has not been time to try many experiments with this plan, but one with poultry manure gave very satisfactory results. One objection to putting manure directly into the tank is, that it may clog the distributing pipes; this, however, may be overcome by building a slatted box in the center of the tank to receive the manure, putting the slats close enough to hold in the manure while letting the water have free ingress and exit so as to carry out the food materials. Probably in using a fine manure, such as poultry manure, it would be necessary to cover the receptacle with wire cloth.

I think I see great possibilities in the use of the tank for the application of chemical fertilizers in solution. The plan I have in mind is to furnish the soil itself with the potash and phosphoric acid, in the forms of ashes, muriate of potash, and superphosphates; then having dissolved nitrate of soda in the water to feed it to the plants as they need it.

If the water for irrigation be taken from a tank, it should be made shallow and wide, so as to expose a large surface of water to the sun, by which means it will be warmed and can be used with

much better results. This does away with the objection against irrigating from wells, that the water is too cold to apply directly to the plants.

It is a great convenience to have water at hand for use when transplanting. I was formerly often obliged to delay this work because of dry weather, but now, with plenty of water for wetting the ground, I am not obliged to wait for a rainy day, but can do the transplanting at any time when ready. If after I have prepared the land and marked it for the plants, it be dry, a hose is attached to the pipe, and the water run on to thoroughly wet a few rows. The plants are then set, and a little dry soil drawn around them to keep the ground from baking; if dry weather continue they are again watered in a day or two. By this means I never fail to make nearly all the plants live when set in the driest of weather. If one has time it will pay to water plants every three or four days for from two to three weeks after they are transplanted, unless there is plenty of rain. This will help them to form new roots and forward their growth. As plants are often set they do not commence growing until several days after they are transplanted, and lose just so much of the best growing season.

My experiments in irrigating strawberries are most satisfactory. I commence to irrigate them as soon as they begin to blossom, putting some poultry manure into the water tank a day or two before. The color of the foliage was immediately changed to a dark green, and the growth that followed was very large, both of leaf and berry. The iron pipes are laid over the bed about at foot apart. If only water is being used it is applied with a sprayer on the end of the hose, and it so placed as to throw the water over two or three square rods without moving it—a revolving sprinkler may be used if there is sufficient force to the water—when, after the ground has been thoroughly soaked, it is moved to another place, and so on until the whole bed is irrigated. If I am applying liquid fertilizers, which may injure the foliage, the sprayer is taken off and the water allowed to run on the ground under the leaves. At the time of the year when this is done there is usually a man at work in the field, cultivating and weeding, and he attends to the watering.

The varieties of strawberries which are the greatest yielders set so many berries that in a dry season they cannot grow to a good size without extra water, and it pays to put it on them if you can sell them for one quart. On gravelly soils in a dry season strawberries are almost an entire failure, but now I can grow good crops on any soil that will hold manure and water.

In growing vegetable plants for transplanting, I find that I can get them ready from one to two weeks earlier by having plenty of water at hand to irrigate them whenever necessary. With celery especially the great need is water from the time the seed is sown until the stalks are blanched for market. When the seed bed is given a good sprinkling every night I have no trouble in getting the seeds to germinate and make strong plants. After the vegetable plants have been transplanted to the field, the water pipe is laid across the highest part, a piece of hose attached, and the water started at the upper end of the row. After the water has run as far as it will more hose is added to carry it further along, irrigating every alternate row first, and then going over the field again, taking the others. W. H. JENKINS.

## Eastern N. Y. Horticultural Soc'y.

### A New Organization of Fruit Growers.

A preliminary meeting for the organization of a society to represent the horticultural interests of Eastern New York was held at Cornwall Monday, Jan. 25. Over sixty representative men gathered together and manifested considerable zeal in the matter. The morning meeting took place in St. Thomas' Hall, W. F. Taber, Poughkeepsie, presiding; E. Van Alestynne, Kinderhook, Columbia County, acting as secretary.

T. J. Dwyer of Cornwall welcomed the visitors in a neat speech, and introduced H. W. Collingwood, New York, who entered into the details as to how and for what purpose they had met. In part, he said that a short time ago he received a letter from Mr. B. D. Van Buren, Stockport, N. Y., suggesting that the Eastern men should get together. This was published in the "Rural New Yorker," and the matter was taken up with considerable interest. He then took upon himself to see Mr. Dwyer and Mr. Taber. The former, in his well-known generous spirit, undertook at once to procure and pay the rent of the St. Thomas' Hall if a meeting be held at Cornwall. This was agreed to, and this gathering was the result.

Messrs. Dwyer, Taber, Passmore, Bingham and Alestynne took part in the discussions which followed. Upon motion of Mr. Dwyer, a committee of seven was appointed to formulate a plan of action, and for this purpose they were to retire for deliberation and were ordered to report to the main body again at 1.30 P. M.

The meeting then adjourned, and the members betook themselves to the Grand View Hotel for luncheon. Owing to the severe cold weather prevailing, the afternoon meeting was held in the hotel parlors.

The committee at 2 P. M. reported that in order to do the proposed work properly and thoroughly, and to make the body truly representative, it was proper that the different counties be asked for assistance and advice, also the horticultural and agricultural press, and to that end recommended that the following gentlemen be elected as a committee to meet at Poughkeepsie at the earliest possible date to consider the matter and draw up rules, etc., which, in turn, should be presented to a general meeting to be held later at Poughkeepsie, Mr. Taber to secure the Court House for the purpose, and Mr. Collingwood to notify the committee of time and date of meeting, the committee to be as follows: E. Van Alestynne and L. L. Morel, Kinderhook, Columbia County; P. W. King and J. B. Carpenter, Athens, Green County; J. H. Lewis, Red Hook, and F. W. Taber, Poughkeepsie, Dutchess County; J. E. Rice, Yorktown, and the Hon. James Wood, Mount Kisco, Westchester County; J. Baker, Rensselaer County; A. W. Williams, Highland, and C. M. Halcinat, New Paltz, Ulster County; W. D. Barnes, Middlehope, and E. G. Fowler, Port Jervis, Orange County; S. B. Husted, Blauvelt, Rockland County. Also the following: Dr. W. H. Hale, Albany; Ira B. Kerr, Catskill; B. D. Van Buren, Stockport; W. H. Hart, Poughkeepsie; J. J. Hull, Clinton Dale; Sands Haviland, Marlboro; J. R. Cornell, Newburgh; C. W. Shaw, Mountainville; W. H. Underhill, Croton Point; T. J. Dwyer, Cornwall; J. Smith and E. B. Andrews, Cold Spring.

Also as representing the trade journals: H. W. Collingwood, "Rural New Yorker," New York city; Dr. F. M. Hexamer, "American Agriculturist," New York city; E. G. Fowler, "Orange County Farmer," Port Jervis; L. Tucker, "Country Gentleman," Albany, and James W. Withers, "American Gardening," New York city. The committee was agreed to unanimously and the meeting then adjourned.

Failures with Manures, either farmyard or chemical, are often due to a mistaken idea as to the proper time to use them. Some forms of manures act quickly, as for example, nitrate of soda or thoroughly rotted compost. As a general rule, some time must pass before the forces in the soil can act on the manures and change them into forms fit for plant food.—S. PEACOCK.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**The Casabanana.**—On page 40 a California correspondent describes briefly the new plant "Casabanana" (*Licania odorifera*). I gave it a first trial the past season, and my experience justifies me in commending it for trial by all who find satisfaction in having luxuriant vines to cover arbors, unsightly places, etc. The fruits of the plant are very valuable for preserves; my wife has just finished preserving the few that I managed to save from the melon worm, which was unusually destructive the past summer. Of hundreds of fruits that set on my half dozen vines I succeeded in saving only six perfect. The fruit was so high up from the ground it was almost impossible to use preventive measures. There is no vine that I know of that will make the growth in 60 days' time from transplanting that the Casabanana will, as it will easily go up to the third or fourth story in that time, and I do not know how much further it would go if it had support. Like the ivy it will cover a chimney, and when covered with its reddish fruit (the size of a full grown cucumber) is a very pretty sight. The flowers are yellow but not specially attractive. The fruit assumes the color of a plantain or "red banana," and the odor when ripe is something like banana and pineapple; it makes a good (and cheap) preserve. Here we start the plant in a cold frame early in March, and set out in open early in April. In the North I suppose you would start and set out at the same time as you do tomato, or egg plant, and I have no doubt the fruit would then mature sufficiently. If gathered prematurely with a foot or so of stem attached it will ripen in the house or cellar. It will certainly make headway on trial.—SAM'L A. COOK, Milledgeville, Ga.

**An Amateur's Progress—Peas and the Sparrows.**—Amateur gardeners are all more or less favored with what is usually termed a hobby. While I do not say that my particularly hobby is gardening, I do find it a very pleasant diversion. Since boyhood days until the season of '96 I found no opportunity to follow my inclination to "garden," but then at every hour, when from my business, I could be found among the vegetables. Early in the season, as spring approached, I was rather impatient to begin planting, but after the first "bed" was made I found work enough to wear off all impatience, and when the young sprouts began breaking through the earth, then I felt that I was to be rewarded, to some extent at least, and suppose I ought to say that my success for the season was good. This year I shall endeavor to do even better, profiting by recent experience. Speaking of success, it is well to mention that my beans, corn, and potatoes were abundant—far beyond my expectations. Onions and beets a failure. Peas were fine for first crop, but my late ones came up well, and that was all. I soon found that the little nuisances, "English sparrows," were the sole cause of my having no late ones. I will mention here for the benefit of AMERICAN GARDENING readers that I have hit upon an original idea, by which I expect to forestall the "pest" this coming season. I have never seen or read of the plan, hence I call it original. I have purchased a few pounds of old discarded fish seine or net, and will stretch some over the rows or beds of peas on stakes, adjusted so that I can

cultivate; in this way the birds will be unable to reach the sprouts and young leaves, and after a couple of weeks' growth they will not care for them. I would be pleased to hear of a more simple and cheaper plan than the above.

I am very much pleased with AMERICAN GARDENING. I scan its pages very closely, and have during the past few months found many suggestions exactly applicable to my wants.—W. T. A., Melrose, Mass.

[The method of protection advocated by our correspondent is excellent, but is not new, though original with him.—Ed.]

**The Free Seed Humbug.**—Would not the public money give better results if expended in the distribution of expert knowledge in the agricultural department bulletins than by buying worthless seeds to give to people who cultivate nothing but a concrete sidewalk?—AMATEUR.

**Cocoanut Growing.**—I notice on page 45 J. W. B. would like to know how to raise cocoanuts from seed. *Cocos nucifera* can be germinated from fresh seeds as follows: Take light, well-drained soil, and a pot 10 to 12 inches in diameter; lay the nut on its side when planting, and cover it about two-thirds only; do not remove the outer husk. The pot should be plunged in bottom heat of at least 75° or 80°. It requires sometimes from two to three months to germinate.—N. BUTTERBACH.

**Copper Salts for Celery Blight.**—In the number of September 5 last, page 570, I find something about treatment of celery blight by using ammoniacal carbonate of copper. Please state how to mix it, and spray it on, and also when to commence, and how often it is necessary.—N. O. S., Galesburg, Ill.

—[Ammoniacal carbonate of copper (cupram) has proved of considerable value for the blights of the celery, but it will not keep them all away. The mixture is made by dissolving five ounces of carbonate of copper in three quarts of ammonia and diluting to thirty gallons of water. This is applied as a fine spray to the celery plants at occasional intervals during the growing season. It is well to begin in the seed bed before the plants are set out and follow it up once in about two weeks until the crop is made.—Ed.]

## How I Grow Potatoes.

"Intensive cultivation" was the remark that impressed me very favorably in the editorial of the AMERICAN GARDENING of December 26, and I thought it might not come amiss for me to give my method of growing potatoes here in central Illinois.

Our soil here is black loam, and nearly or quite all of the land is thoroughly underdrained.

As we have very little sand in the soil we choose the very richest land we have, and if possible, somewhat elevated. We have no hills of very great dimensions, but try to keep out of the lowest places.

Fall plowing is very much preferred, and that as late in the fall as we dare wait, for fear of frozen ground. Nothing should be allowed on the field after it is plowed until work is begun in spring. This will sound very queer to some Illinois growers, but as the ground remains frozen it becomes dry, and stock running over it will knock the loose dry dirt into the cracks and holes in the plowed ground, thus preventing it from freezing so deep and "slacking" so well as it otherwise would do, so I say again, allow no stock to pass over the plowed ground.

Plow 8 inches deep, and as soon as the ground is in fit condition in the spring, start the cultivator. I prefer an ordinary

## Experi-

ments are expensive. It is no experiment to take the medicine which thousands endorse as the best—which cures when others fail, namely

## Hood's Sarsaparilla

The Best—in fact the One True Blood Purifier.

Hood's Pills cure nausea, indigestion, biliousness. 25 cents.

**GAME COCKERS?** Send 50 cts. for a monthly journal devoted to Game fowls. Sample 5 cts. **GAME FANCIERS JOURNAL**, Battle Creek, Mich.

Mention American Gardening when you write.

## ONE YEAR FOR 10 CENTS

We send our monthly 16-page, 48 col. paper devoted to Stocks, Bonds, Real Estate, Fashions, Household, Gardening, Personalities, Poetry, etc., one year for 10 cents, if you send the names and addresses of six lady friends. **WOMAN'S FASHION JOURNAL**, 4815 Evans Ave., Saint Louis, Mo. ## The American Kitchen Magazine

A magazine for every up-to-date housekeeper. The suggestions contained in a single number are worth more than a year's subscription. Price, \$1.00 a year. Sample copies free. **SPECIAL.**—We will send AMERICAN GARDENING and AMERICAN KITCHEN MAGAZINE, both one year, to any address, for \$1.50.

AMERICAN GARDENING, P.O. Box 1697, N.Y.

## 50 CENT Music Books

## FOLIO OF ORGAN MUSIC

A new volume of 56 compositions for home or church use. The compiler has succeeded in gathering together in this book over fifty of the finest compositions for the organ ever issued. Postpaid.

## SACRED SONG FOLIO

A new collection of nearly forty sacred songs for Soprano or Tenor voices. Within the pages of this book will be found many of the finest compositions ever written by the world's masters of melody. Postpaid.

## SACRED SONG FOLIO

For Alto and Bass voices. A companion volume to Sacred Song Folio for High Voices. It contains nearly fifty of those beautiful solos which are enduring in their popularity. Postpaid.

## SONG FOLIO VOL. III

This volume in the celebrated "Folio" series undoubtedly reached the climax in point of musical excellence. Nearly 80 song gems from the best writers. 15 cents extra for postage.

## FOLIO OF BASS SONGS

The eighty-eight songs for Bass or Baritone voice which make up this book were written by the most talented composers of the world. Both old and new favorites are included. 15 cents extra for postage.

## COLLEGE SONGS

A collection of over 100 new and popular songs of American Colleges. New and valuable additions. Indispensable for social gatherings and all places where merry song and laughter finds a place. Postpaid.

## REMEMBER

That any book or sheet of music published in any part of the world can be procured of us at shortest notice.

eagle claw (commonly called) cultivator. Cultivate one way; then cultivate crosswise; then lengthwise; crosswise again, and keep on cultivating till the soil is as loose as an ash heap, and finally finish up by cultivating with a disk harrow once or twice, then with a common tooth harrow.

If a potato planter be used, it will make enough ridge so that the row can be seen; if a planter be not used, then ridge just a little in covering. Before the potatoes come up harrow them twice at one harrowing, and do this by lapping your harrow, and keep the horses off the rows. If weeds start quickly and early, the field may need harrowing again, and this time the rows cannot be seen, and the horses can't be kept off the rows; but it *must* be harrowed. As soon as the potatoes come up so that the rows can be seen, harrow once over, and again the third or fourth day after; or, better still, use a Breed Weeder. Let me repeat it, keep the horses off the rows. Do not in any way pack the ground in the row.

From this time onward, if you have a Breed Weeder, use it alternately with any other good cultivator with which you can cultivate shallow, keeping on at this work till the vines grow so large that you have to quit; but do not under any circumstances throw up any ridge.

If a ridge be thrown up, there will be a hard place between the rows, and it will help to dry out the ground; also, if it rain, the water will run off the ridge into the furrow, and not reach the roots of the plants as it should; while if level culture be practised, all capillary evaporation will be cut off and the moisture retained.

Plant early varieties 3 inches deep, and late ones 4 to 5 inches. If the ground be not rich, make so by heavy dressings of thoroughly rotted manure. If your potatoes have scab, treat them with corrosive sublimate before planting, using two ounces to fifteen gallons of water.

For early potatoes, I prefer Early Ohio, Early Market, Acme, and King of the Earlies; for late, Carman No. 3, Harvest King, State of Maine, Carman No. 1, and Champion. This section of Illinois is not considered a potato country, but under this intensive cultivation I have not failed to grow three times the usual yield, and hence I do not hesitate in giving it.

I usually grow eight or ten acres of potatoes, and from one-half to one acre is devoted to the testing of new varieties; and if the Editor deems this worthy of publication, I may write about these at another date.

L. S. SPENCER, Pesotum, Ill.

[We, and our readers too, will be glad to welcome the further communication suggested.—ED.]

**Intensive Cultivation.**—I believe I can safely say that when you find an orchardist who objects to small fruits in his orchard, you will discover, by cross-examination, that he expects good results with only ordinary farm cultivation. This will not do. You cannot expect to grow small fruits successfully in or out of the orchard without expending much money and labor. In a general way, I advise only those with small young orchards to grow small fruits between the rows during the first six or seven years, when the trees need the most active cultivation.—Ohio Farmer.

#### A Thermometer Free to Our Readers.

Recently we received from Warner's Safe Co., of Rochester, N. Y., a useful spirit thermometer, graduated from 20° below zero to above, and mounted on heavy 4x6-inch card board, in red and green. A duplicate will be sent by mail, free to any address on receipt of 5 cents in stamps to pay postage. To be this free distribution is intended to advertise the firm's goods (see advertising columns), but, nevertheless the thermometer will be found to be a useful as well as ornamental article, and well worth the little trouble and expense of sending for it.

No other oil and no other medicine has ever been discovered which can take the place of Cod-liver Oil in all conditions of wasting. New remedies come, live their little day and die, but Cod-liver Oil remains the rock on which all hope for recovery must rest. When it is scientifically prepared, as in Scott's Emulsion, it checks the progress of the disease, the congestion and inflammation subside and the process of healing begins. There is the whole truth. Book about it free.

## Forcing Radishes.

### Cleanings From a New Jersey Establishment.

"Yes, these have paid first-class this season. I never knew them to do better. How many have I forced? Let me see: Seven one hundred-foot benches. Have they paid well? There, now, don't get asking questions; it isn't policy nowadays to say anything pays; if you do, everybody wants to grow that same thing next season, and then the 'snap' is gone, and against you come to size up everything—picking, bunching, and getting to market—there is not much in radishes, anyway."

"Looking at your houses and knowing what prices you have been getting, we are inclined to think you have been very successful, and I feel like telling the readers of AMERICAN GARDENING about you."

"Oh, please, don't do that; some other day you may, but not now, for I do not rank as a vegetable grower yet; I am a Carnationist, only seeing the red light, I switched off, and after Chrysanthemums, filled up with radishes."

"Do you mean by 'red light' that you foresaw the low prices that Carnations are making this season?" "Why, yes."

"When did you sow your first seed?" "November 14 and 19."

"When did you ship your first lot?" "On December 24 we shipped 75 bunches."

"You got 4 cents a bunch for them?" "Yes, but don't tell anyone."

"There were 12 in a bunch?"

"Yes; we got \$4 per hundred bunches for the next two hundred, then \$3.50 for some time, and now we are only getting \$3, and we are putting 14 to the bunch."

"What varieties do you like best, you have several on trial?" "Oh, give us Early Scarlet Globe, every time. That was the first by ten days. It is a pretty radish and bunches nicely, not very large but very choice in quality, small topped and light rooted. White-tipped makes so much more top and there is a larger percentage of waste—so many that never form up—and with its larger top there is more danger of fungus, and beside there is at least ten days' difference in time, and that is an item, for we are needing room now for other crops. We have also tried Red Rose and Rapid Forcing, but Early Scarlet Globe beats them all."

"Have you tried Earliest Carmine, or Extra Early Deep Scarlet White-tipped Forcing, or what is cracked up by many to be the best of all for forcing, viz., Non Plus Ultra?" "No, we have not had any experience with those; we hear they are good, and Non Plus Ultra is said to have a very small top, and we will have to try it. I am thinking, on our light benches it would go well with Scarlet Globe; and there's a point for you: radishes want as much light as Roses. The better the house, the better the results."

Jersey market growers are hard to get information from, at times, but the foregoing, by a little engineering, was obtained from a very successful grower by a JERSEYMAN.

**Birds and Crops.**—A gentleman shot a magpie to save his cherries. In his craw he found a few cherry stones, and the rest crammed with large blue-bottle flies, who deposit their eggs in meat. Blackbirds do some harm in the cornfield while there on their errand for grub worms, caterpillars, and army worms, which, unless thus interrupted, would destroy more corn than the birds. So with thrushes, woodpeckers, and doves.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Heading Off Insect Enemies.

If one be not likely to give the plants the full due of time necessary to keep them free from insects, it is a desirable thing to have them home-grown so far as possible. No one item saves so much work along this line, as it is a fact that vicious insects are very largely introduced upon plants brought from the florist. The present writer grew window plants for years before ever seeing a red spider or any other troublesome insect, aside from the green aphids. This was when all were home-grown, either from seed or from cuttings. Now that greenhouse plants are frequently added to the collection, scale, mealy-bug, black aphids and red spider have often to be reckoned with. Tobacco dust is an excellent window insecticide, but it is far from attractive when dusted on the plants to remain for several days. Sprinkled on the surface of the pots, it serves its purpose as a discourager of insects after the plants are once clean, but some blooms are injured by the rising fumes. Many Rose growers, especially, give it the cold shoulder.

#### The White Wyandotte Gaining.

The all-around fowl must be the one for the all-around use; special needs can never refute this, no matter how hot the controversy. Among older, all-around breeds, none other has ever suited the general raiser like the Plymouth Rock; but none has increased in popularity during the last three years like the White Wyandotte. The Plymouth Rock is of good size, plump, and a fair layer, but with an evil tendency to sit long and hard, and to take on too much fat for continued good laying. The White Wyandotte has all the good qualities of the Plymouth Rock, with the two more prominent ill points much improved. Besides these good qualities, it dresses off clean and attractive. If any breed now known ever displaces the Plymouth Rock in the home yards, how can it be other than the good-natured, motherly, plump, sizable, prominent-breasted, well-laying White Wyandotte?

#### Asparagus for the Housewife.

The two classes of asparagus, that for the garden and for the window are both replete with interest for the housewife. None appreciates so well as she, surely, the value of garden asparagus; for she has not only the palate to be tickled, like the rest of the family, but she has a pleasing bill of fare to make out in the "betwixt and between" season. The ornamental sorts are a joy to her heart, too, with the one proviso, that they do not too much resemble the kitchen garden varieties. This fatal resemblance, alone, would make her give less heed of praise to Asparagus tenuissimus than to the lovely lace-like plumes of A. plumosus. Of half a dozen other sorts catalogued, she may never have heard, but her loss is little, since she has A. plumosus, the most desirable of all. There is a new sort, however, soon to be pushed at retail, but now just beginning to circulate among the florists, known as A. Sprengeri. This differs considerably from the better known forms, and is called one of the best novelties introduced in several years.

#### Frozen Combs.

This is a difficulty sure to meet the amateur. In cold climates, the best way, without question, is to keep the low or double-combed varieties. Frozen combs, however, are not a necessity if sufficient precautions be taken. One raiser states that the birds must be kept in whenever the thermometer touches 20°. We have found 10° above zero the danger line, but a sharp wind makes many degrees of difference, and the fowls should always be protected from the wind. Within fairly close buildings we have no trouble till zero point is reached, or even a few degrees below for a short time. A lantern hung low in the house during extreme cold, will often moderate the temperature sufficiently. Abolishing with vaseline is a good remedial procedure, but no remedy equals prevention.

## IT'S CURES THAT COUNT.

Many so-called remedies are pressed on the public attention on account of their claimed large sales. But sales cannot determine values. Sales simply argue good salesmen, shrewd puffery, or enormous advertising. It's cures that count. It is cures that are counted on by Ayer's Sarsaparilla. Its sales might be boasted. It has the world for its market. But sales prove nothing. We point only to the record of Ayer's Sarsaparilla, as proof of its merit:

## 50 YEARS OF CURES.

#### The Indoor Daphnes.

Inquiry having been made concerning the Daphne lately mentioned in these notes, it may be said that the plant has just gone into retirement, after having given twenty-five clusters of fragrant bloom. These delightful Daphnes, though old, are very rare. Ordinary dealers in plants seldom offer them. They are to be obtained, as a rule, only from those who have unusually large collections of stove and greenhouse plants. There are two forms of the window Daphne known as Daphne indica alba (white), and Daphne indica rubra.

## AMERICAN GARDENING AND THE OHIO FARMER,

Both One Year Each for only \$1.60.

THE OHIO FARMER is a large, 30 page weekly, \$1 per year. A National Farm, Stock and Home Journal, and is clearly the Leader of the Agricultural Press of America. It pays more for Illustrations, Correspondence and Market Reports than any other of its class. It is the Best and Costs no more than others. Send for a SAMPLE COPY to THE OHIO FARMER, Cleveland, O. THE OHIO FARMER will start their paper the date the order is received by them, and continue to Jan. 1898—14 months, if ordered at once. Address all orders to AMERICAN GARDENING, P. O. Box 1697, New York.

## WHOLESALE MARKET REPORT

## New York.

Business in cut flowers of nearly all kinds, especially roses and carnations, improved considerably at the latter part of last week and the early part of this. The supply lightened up very considerably and the market cleared out each day, something that has not happened in a very long time before.

Trade in hot-house vegetables and fruits stiffened a little on some lines, if stock was very fancy. Fancy lettuce did not do as well as expected, it would seem that the Florida and New Orleans stock has tired the buying public, which has switched off to something else. Strictly fancy are quoted at from 25c. to 60c., but much of that examined would not warrant being classed thus. Many growers seem to imagine that because a thing has been grown in a hothouse that it must be fancy.

Radishes are in good demand at from \$3.00 to \$4.00 per 100 bunches.

Tomatoes, when good and high colored, make 35c. per lb.

Cucumbers are still in light supply and meeting with brisk sales, and making as high as \$2.00 and \$2.50 per dozen for No. 1. There are quantities of No. 2, but even these have met with good sales at fair figures.

Mushrooms are more of a glut than ever, and positively will not move. One Long Island grower is reported to have disposed of 800 lbs. last week at 10c. per lb., average. Other growers have failed to realize on small quantities more than 20c. and 25c. per lb. Arch, Deacon & Co., who are very large dealers in these, report unusual stagnation and inability to quote any steady figure. The only thing left is to sell at whatever price possible. The plentiful crop and small growers peddling them around has practically killed the price for this season.

Strawberries, home grown, are still selling at \$4.50 per quart for No. 1; No. 2 50c. per quart; Florida stock is quoted at 50c., but drops.

European grapes are light in supply and sell at from 75c. to \$1.25 per lb.

California pears from storage selling slow; the quality of most stock is good, but the demand very poor.

APPLES.—The extreme cold weather prevailing is causing strong pressure to sell the stock unloading on the dock, and prices are weak and unsettled. On usual qualities any reasonable bids are being accepted which will move stock promptly. Most sales of Baldwin and Greenings are in range of 75c. to \$1.00 per bbl. Scarcely anything is doing in grapes.

## Apples.

Spitzburg, fancy, per bbl. .... \$1 75 @ 25

Catawba, w'n N. Y., good to fancy,  
4-lb. basket. .... 10 @ 13  
Catawba, inferior, 4-lb. basket.... 7 @ 9

## Vegetables.

White onions are nominally firm for fancy qualities under light offerings; reds are quiet and weaker; choice Orange County stock offering at \$3; yellows are dull, but stock in store is held unchanged. Local winter vegetables nominally unchanged. Norfolk steamer brought 1,900 bbls. of spinach and 1,200 bbls. of kale; some of the stock was almost worthless, and sold at merely nominal figures. An occasional lot of choice kale brought 60c., and one or two lots of spinach were placed above \$1, but most of the business was in range of former quotations. The Savannah steamer brought 1,845 crates and 123 bbls. of Florida vegetables.

Turnips, Canada, Russia, per bbl... 60 @ 70  
Tomatoes, southern Fla., per carrier 75 @ 1 50

## Philadelphia.

The severe cold spell has greatly interfered with the market this past week, and there is very little produce moving. Had the mild weather of last week continued, no doubt prices would have advanced, as there is not so much stock coming from Florida growers; they have become disgusted with the poor returns and have evidently tried other markets.

Local growers are in hopes that the cold snap has gone well South, and will therefore cut off this strong competition and so help the local market.

Prices have not changed much from last week. Apples continued to sell fairly well as from \$1.50 to \$2.00 per bbl. Most of those coming in are New York State fruit, and arrive in good condition.

Mushrooms are becoming more plentiful, and prices will undoubtedly drop.

Florida strawberries are more plentiful, and are selling at 50 to 75c. per qt. baskets; the demand is slight.

Hothouse tomatoes are improving in quality, but unless of good color and substance sell slowly.

Hot house grapes imported are in fair supply, but the demand is light. White grapes (Spanish) are selling fairly well.

## Vegetables.

Beets, Florida, per 100 bunches. .... \$4 00 @ \$6 00  
Brussels sprouts, per qt. .... 8 @ 12  
Cucumbers, Florida, per crate. .... 1 50 @ 2 00

## Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

COLE, Pella, Ia.—Garden Annual for 1897. Illustrated.

F. C. HEINEMANN, Erfurt, Germany.—General Seed Catalogue.

T. W. WOOD & SONS, Richmond, Va.—Illustrated Seed and Plant Catalogue.

E. W. BURBANK SEED CO., Fryeburg, Me.—Catalogue of Field and Garden Seeds, Implements, etc.

THE GEO. A. WEAVER CO., Newport, R. I.—Annual Illustrated Catalogue of Seeds, Farm, Garden and Lawn Supplies.

A. A. MARKS, 701 Broadway, New York.—Catalogue of Artificial Limbs and other Appliances for the Maimed. It is quite a curiosity, and we would advise our readers to send for it. It is really wonderful the improvements which have been made in artificial limbs and in tools for the use of those who have lost their hands or arms.

## A Mightier Foe Than Armies.

## OVERCOME BY A BRAVE UNION GENERAL AND HIS FAITHFUL ALLY, DR. WILLIAMS.

From the Sentinel, Cherokee, Kansas.

At the breaking out of the war of the rebellion in 1861, General Wiles, whose portrait adorns our page, was captain and owner of the then well-known river steamboat, "Charley Potwin," plying between Zanesville and Parkersburg, but he immediately disposed of his boat and became enrolled as lieutenant in the 78th Ohio Infantry. At the battle of Fort Donelson, on February 16, 1862, Lieutenant Wiles was promoted from lieutenant to lieutenant-colonel, for "brave and meritorious conduct on the field," and at the age of thirty-six

proving fatal. Typhoid fever, followed by inflammatory rheumatism and then paralysis, made a temporary wreck of the herculean frame, and in view of his advanced age, his anxious friends believed that he was not long for this world. The following is his own account of his illness.

"In the latter part of 1890, I was taken down with a severe attack of typhoid fever, which confined me to my bed for two months. Two months is a long time to be in bed, but I was not to get up yet, for inflammatory rheumatism seized me, and it was worse than the typhoid, for it was more painful. To add to my trouble and make it more interesting, the inflammatory rheumatism was followed by a stroke of paralysis, and I lost almost totally the use of my legs and arms, for I could not walk a step and could not feed myself. It would seem that I had reached the depth of misery, but such was not the case, for my kidneys gave out, and this seemed to be the last straw on the load that was to crush me.

"My friends all thought I would never recover, and though the doctors came to see me and prescribed, it was easy to see that they were but trying to make my pathway to the grave a little more easy, without the remotest hope of recovery, and I looked forward to death with happiness.

"While in this frame of mind, I was advised by a friend to try Dr. Williams' Pink Pills, and began the use of them, taking one pill after each meal, and this I continued for one week, and began to fancy I perceived improvement in my condition. I then increased the dose to two after each meal, and at the end of the second week there was no doubt but what Pink Pills were making me better, so I kept on using them according to directions, and in three months was a well man."

Dr. Williams' Pink Pills are sold by all dealers, or will be sent post paid on receipt of price, 50 cents a box, or six boxes for \$2.50 (they are never sold in bulk or by the 100), by addressing Dr. Williams' Medicine Company, Schenectady, N. Y.

GENERAL G. F. WILES.

General Wiles was colonel of his regiment, and while with Sherman, was gazetted brigadier-general.

The General lives the greater part of his time in Halstead, Kansas, though he is much in Windsor, New York, in both of which places he has business interests that require his presence.

Some few years ago General Wiles was attacked by illness, which came very near

Mention American Gardening when you write.

## PRIVATE GARDENERS.

We solicit for publication under this heading notes on the work being done by private gardeners, changes in appointment, and all matters of interest to horticulturists generally.

### Notes on Bedding Plants.

It may seem somewhat early to discuss bedding plants in midwinter, but in order to ensure success in our work during the coming season, we should prepare in advance. And to those having a little space available in the greenhouse, it may be said that this is none too early to begin working up a stock of some of the most necessary plants for this purpose, and prominent among these are the improved Cannas.

These grand decorative plants are evidently gaining in favor each season, and deservedly so, for they not only add greatly to the effectiveness of the average garden, but also are leading toward a better style of gardening than used to be found in the stiff and formal blocks of Geraniums, Coleus and Alternantheras that once formed the major part of the flower beds in the vicinity of our large cities.

It will, of course, be understood that there is no intention of condemning formal bedding as a whole, for in certain locations, it is most effective and eminently proper, even though we have no sympathy for such floral nightmares as have sometimes been seen in noted public parks and elsewhere.

But to return to the Cannas, there is undoubted progress in some of the new varieties, and one of the best is "Egan-dale," a strong-growing, dark-foliaged variety with bright crimson flowers, the latter being produced in large trusses, and standing up well on strong stems. Columbia also produces very large, dark colored flowers, but has green foliage, and complaint has been made that it is not so strong a grower as had been expected. Queen Charlotte is remarkably showy, the broad yellow edging on its bright red petals attracting attention from a considerable distance.

The spikes of this variety are also large and branch freely, thus giving a long succession of bloom. Various clear yellow seedlings have been offered, but perfection in this line does not yet appear to have been reached, while of yellow varieties that are spotted and marked with orange and red, there is almost an overplus, and still more to follow.

The propagation of these Cannas

### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

SITUATION wanted on private place, by a German, married man, good all around gardener, best of references. Address L. T., Box 446, Summit, N. J.

GARDENER and Florist, 30 years' age, single, German, 15 years' experience, wishes to take charge of gentleman's place, first-class references. Address L. D., care American Gardening.

SITUATION wanted in private place, age 28, understands growing of outdoor and greenhouse vegetables and flowers, care of lawns and general gardener's work. D. J. care American Gardening.

BY women, each with an infant or young child, situations in the country (general housework, plain cooking, etc.) in New York and adjacent States. Small wages expected. Railroad fare paid by Association. Apply State Charities Aid Association, 105 East Twenty-second St., New York City.

SITUATION wanted—First-class Gardener with diploma from both sides of the Atlantic, will guarantee financial success in producing choicest roses, also mushrooms under glass, in same building, and heat, thereby saving expense in labor, space and fuel; forcing vegetables under glass and European grapes specialties; thorough artist at table decorations; good landscape gardener; best city references. Wm. Thompson, 741 First Ave., N. Y. City.

Mention American Gardening when you write.

should begin now, providing a temperature of 60° or over can be maintained in the greenhouse, the tubers being divided with a knife, and the sections potted up into as small pots as possible, 4 inch pots being usually used for this purpose. After potting, give a moderate watering to settle the soil, then water but sparingly until the plants have made some new roots, for too much moisture at this time will result in rotting the tubers. By beginning this operation thus early, time is given for a second division of the young plants before planting-out time, in case the first division does not provide a sufficient stock of some particularly desirable variety.

The Crotons have again come to the front in eastern gardens, and almost anywhere south from New York will give admirable results. And in this connection it may be worth noting once more that the Crotons should be hardened off before planting out, this being readily managed by putting them outdoors in a frame, where the ventilation is gradually increased for a period of about ten days before the final planting.

Another thing to be borne in mind is the fact that Crotons will grow more freely when planted right out in the bed than when they are left in pots and simply plunged, and strong young plants that are planted in rich soil and given an abundance of moisture, will make greater progress than old plants that have been cut back several times.

Among the varieties that have been notably fine the past season are Day-spring, James de Rothschild, Queen Victoria, and Fascination, these having been exceptionally good in the gardens of Girard College, Philadelphia, at which fine establishment a special feature has been made of outdoor Crotons by Mr. Geo. Huster, the gardener in charge, for several years past. Strobilanthes Dyerianus has not proved an entire success in this locality, for though its growth was free enough, yet the color of the foliage disappeared to a great extent during the long hot and dry spell in the latter part of the summer.

Up to the latter part of July the Strobilanthes leaves were beautiful, and the plant seemed to be an acquisition, but after that time it failed greatly and looked decidedly weedy, though there is a possibility that better results may be had in a more favorable season.

The white variegated Abutilon, Souvenir de Bonn, made a good showing in several localities that I noted it, and seemed to stand pinching very well, though it would doubtless be more effective and produce finer foliage when planted in a large bed of foliage plants, where but little trimming would be needed.

Occasionally a plain green shoot was observed on this variety, but the tendency to run out did not seem to be very marked.

Another new Abutilon of somewhat similar character to the above is being sent out under the name of A. Savitzei, this being claimed to be a considerable improvement on A. Souvenir de Bonn, but as it has not yet been tested as a bedding plant, it is too soon to offer an opinion on its merits. A mingled bed of Abutilons is one of the possibilities of the coming season, and can be made a telling feature in the garden by the judicious use of A. Thompsonii (yellow variegation), A. Pattersonii (green foliage, dull red flowers), A. Boule de Neige (pure white flowers), A. Souvenir de Bonn, and an edging of A. vexillarium pictum. And if still more variety is desired, some one of the clear yellow

flowered varieties could be added—for example, A. Canary Bird or A. Yellow Prince.

Tuberous Begonias have not been a success in this vicinity (Philadelphia) so far, though it is to be hoped that their peculiar needs will be better understood in the future, for the descriptions one has of the brilliant successes attained in Europe with these plants increase our desire to do likewise, providing our trying climate will permit it.

W. H. TAPLIN.

#### Grapes Under Glass.

I see you are publishing Mr. W. Scott's essay on "Grape Growing under Glass," and, therefore, send you a photograph of one of the houses, where he at one time had charge. This photo, however, was taken when I had charge of it. The house is 100x30 feet; the variety is Gros Colmar. The place is Park Hall, Polmont, Scotland. ALEX. NAPIER.

[The photograph sent in by our correspondent showed a well managed, well cultivated lot of grape vines, bearing a very full crop of grapes—Ed.]

#### Boston.

An interesting exhibition of plants and flowers was made in Horticultural Hall on Saturday, January 16. Oakes Ames (Carl Blomberg, gardener) sent several Orchids, one of which, *Scuticaria (Maxillaria) Steelii*, was growing on a block of wood; it is known as the "Shoestring Orchid," from the peculiar foliage which looks like green cords 3 feet or more long. It is a native of British Guiana. There were two seedling *Cypripediums*—Susan Ames, a hybrid between *C. Leeanum* and *C. nitens*, and *Cypripedium*. F. T. Hubbard, a hybrid between *C. marmorophyllum* and *C. barbatum*. Honorable mention was made of these by the plant committee. There were also six other *Cypripediums*: *Fascinator*, *Leander*, *Hyeanum* (from Borneo), *Daviesianum*, *Colmanii nigrum*, and *Morganæ*. A gratuity was awarded to C. E. Richardson for a plant of *Senecio Petasites*.

Hugh Graham, of Philadelphia, sent a vase of the new Carnation Victor, a sport from Daybreak, which received honorable mention. James Comley brought another large collection of Camellias, among which were Wilderii, C. M. Hovey, President Clark, Cup of Beauty, etc., for which a gratuity was awarded. He showed also a seedling *Lasiandra* and a seedling *Brugmansia*. Dr. C. G. Weld (Kenneth Finlayson, gardener), sent some handsome cut flowers, including *Hippeastrum aulicum*, *Erica Wilmoreana*, *E. hyacinthiflora rosea*, *Streptosolen speciosum major* (new), *S. Jamesonii*, *Centropogon Lucianus*, some fine spikes of *Phalenopsis Schilleriana* (Orchid), and two seedling scarlet *Pelargoniums*. A gratuity was awarded for this collection.

Gratuities were awarded by the vegetable committee to Norris Comley for rhubarb, and Warren Heustis & Son, for celery.

#### Lenox, Mass.

At a meeting of the Horticultural Society, Jan. 18, Mr. Littlefield, representing Mr. C. W. Ward of the Cottage Gardens, Queens, L. I., had on exhibition a fine display of new and standard varieties of carnations which secured the following honors: Certificates for C. A. Dana, Mrs. G. A. Bratt and Glacier. Diplomas for Lillian Strauss and Snow Crest; special mention for Mrs. Charles Dume, Abundance, Mrs. Potter, John Young, Storm King and Mrs. Jas. Dean.

Mr. George Thompson, Superintendent to H. H. Cook, Esq., showed some very nice cyclamen for which he was awarded the society's diploma.

Mr. Thomas Hartnett, gardener to Mr. De Witt Smith of Lee, showed *Freessias*, the flower stems of which were about thirty-two inches long. (Diploma).

The feature of the evening was a lecture by Mr. P. O'Mara of New York, on "The Gardener's Mission in Horticulture." This will be given in full in our columns.

## YOUR ENEMY STOLE IN

An enemy stole into your house one day last week and touched you lightly in passing. You thought little of the matter at the time, for the enemy was only a vagrant current of air. But now you are beginning to learn what mischief the little intruder did, for your back is stiff and painful. Your head aches, and at times you feel dizzy.

What has happened? Simply this: the cold has settled on your kidneys. They are overcharged with blood and inflamed. Instead of passing the waste matter out of the body they are damming it up in the blood. Every minute, yes, every heart beat adds to the poison in you.

Normal action of the kidneys will purify the blood. Nothing else will.

*WATER'S*  
**Safe Cure**

is the friend in need. It will reduce the inflammation, so that the grip on the tissues of the blood-vessels is relaxed, and the uric acid is sent on its way out of the body.

#### Thus You Overcome Your Enemy

Large bottle, or new style, smaller one at your druggists.

## A GOOD Pruning Knife.

#### YOU HAVE NEED OF ONE?

Send \$1.00 to the New York Farmer, Port Jervis, N. Y., and the knife will be sent, postpaid, as well as the paper for one year.

#### The New York Farmer

is a wide-awake, up-to-date journal, looking after the interests of the agricultural population, keeping well in the foreground in all matters pertaining to agriculture, the dairy, poultry, etc., and furnishes, in addition, much valuable literature for the home.

Send 5 weeks for 10c. - postmen copy free.

....BEAUTIFUL....

## Twelve Everblooming Roses

Grower's selection from leading varieties.

Of all premium offers this is decidedly one of the most tempting and we fully guarantee its absolute reliability. Grower says: "We will fill your orders with strong well-ripened plants, grown specially for the purpose, from 2½ inch pots. This is our most popular collection

and it has made hundreds of customers for us, as the testimonials in our possession will show." In this collection will be found such varieties as:

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

•• We cannot undertake to reply by mail.

## BIGNONIA VENUSTA.

(To M. W., Arlington, N. J.): The specimen submitted is *Bignonia venusta*, a native of South America. Its season of flowering ranges from September to February. It thrives best in an ordinary greenhouse, and likes to be allowed to run freely over the rafters or roof, or it makes an admirable pillar plant in a cool greenhouse, but usually resents any sort of restrictions, and under such conditions flowers but little. When allowed liberty, it usually is a very profuse bloomer. For potting soil, use coarse fibrous loam, a little leaf mold and some very sharp, gritty sand. A few pieces of charcoal added are advantageous. Keep a sharp lookout for insect pests—red spiders, mealy bugs, etc.

## TREATMENT OF CYPRIPEDIUM.

(To M. E. F.): Now your cypripediums are over blooming, treat them even more liberally than had already been the case. Keep the temperature as warm and the air as moist as the peat, and if it be necessary renew the peat and moss. Strive in every way to get the plants to make as many new and vigorous growths as possible, so that the plant may be well established before the hot weather of summer; then, during that season, you will keep them as cold as possible. Many cypripediums do well at that period if under the shade of trees or in cold frames.

## CARE OF CYCAS.

(Please inform me through your paper how to treat a Cycas. I have one thirteen years old, which has never done well. Would like to know what kind of soil to use; if the plant should have the sun.—F. E. W.)

—During the winter months any cycas enjoys a high temperature and a moist atmosphere, and plenty of sunlight. But little soil is needed at the roots, but that little should be of a rich and porous nature; strong loam with lots of fibre in it, sharp sand and a few nodules of charcoal makes a good mixture.

## TREATMENT OF PLUM TREES—BEARING AGE.

(What treatment should be used for plum tree pests, and when applied? Our trees are six years old, but have never borne any fruit.—AMATEUR, Cohocton, N. Y.)

—Amateur should be explicit as to the kind of pests on the trees. Plum trees are subject to a number of diseases and enemies. Chief among them are black knot, plum leaf rust and the curculio. Remedies will be given in proper season in our fruit and garden notes and in special articles. The bearing age depends a great deal on the variety and the treatment received, and will vary from two to seven years after buying from the nursery.

## DISCOLORING CELERY WITH BORDEAUX.

(Do you know any remedy against "celery rust"? If so, would you kindly inform me of such? The past season I have tried spraying with the "Bordeaux mixture," and I had some success. The best result was obtained by spraying just before papering the celery for bleaching. It improved it about 50 per cent., but the objectionable feature is the discoloring of the celery by the Bordeaux mixture. Do you know of a better remedy?—M. L. R., Cuyahoga County, O.)

—The cupram mentioned on another page of this issue is a much clearer liquid, and does not disfigure the crop; it is also as effective as the Bordeaux, and is to be recommended in its place.

## TO BUD SEEDLING FRUIT TREES.

(I have some seedling pears of one year's growth, and sprouts of pear trees that I wish to bud next summer. Would it be better to cut them off and plant the roots, or plant them as they are and bud in last year's wood?—X. Y. Z., Kansas.)

—It would be best not to move them, but to cut them back and bud on the summer growth in July or August.

## WATERMELONS WILL NOT FORCE.

(Can watermelons be raised in a hotbed? I intend to start the plants in the greenhouse and transplant them in the hotbed about the beginning of April. Which is the best kind for this purpose, and how long does it take to get the first crop, if raised in the way suggested?—NEW READER, N. Y.)

—We have no experience in growing watermelons in the way asked; neither do we know of any one who has done so; more than that, we do not think it practicable, and even if possible it would not be profitable. The South commands the market with early supplies. We have tried potted plants to transplant outdoors early, and found the process useless; also the same with musk melons.

## AMERICAN GARDENING CLUB LIST.

LET US FILL YOUR ORDERS FOR 1897.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

ADDRESS: AMERICAN GARDENING, P. O. Box 1897, NEW YORK.  
CASH WITH ORDER.

**Names of Plants.**—(To A. G. Dwight, Ill.) No. 1 is an Acacia. Send us a larger spray when in flower, and we will name it for you. No. 2 we cannot recognize from such a wretched scrap. It must be distinctly understood that we will not hazard the name of a plant from any insufficient sample. Ample material must always be sent, and that properly packed, and whenever possible it should be a flowering branch.

**Wanted.**—*Garden and Forest*, No. 31, Vol. 1; state price to C. B., care American Gardening, Box 1877, New York.

**We Never Prune a tree while frozen; a warm, pleasant day is desirable.**

**MR. O. W. MAPES**, of Middletown, N. Y., says that *The Rural New-Yorker* is the next best thing to having a farmers' club meeting composed of the best informed men in the country, every week at his own fire-side. Wouldn't you enjoy such a meeting and profit by it? We can send you *The Rural New-Yorker* and *AMERICAN GARDENING*, both one year for \$1.80 and your money back for *The Rural*, if you want it.

For \$4 we will send *Leslie's Weekly* (formerly *Frank Leslie's Illustrated Weekly*) and *AMERICAN GARDENING* to any address, one year. *Leslie's* is one of the most attractive of New York's numerous illustrated weeklies, and its subscription price alone is \$4 a year; therefore, it will be seen that our offer is a very liberal one. Address your orders to *AMERICAN GARDENING*. Sample copies of *Leslie's* on application.

**POULTRY BREEDERS!** Send 50 cts. for a 20-paged monthly devoted to Poultry, etc. Sample 5 cts. **MICHIGAN POULTRY BREEDER**, Battle Creek, Mich.

Mention American Gardening when you write.

**Second Crop Potato Seed**—Surpass all others in yield. **OMNIS A. BROWNE**, Cape Charles, Va.

Mention American Gardening when you write.

**McKinley's Choice.** (No one else has them.) Solid Cut Froidle Vineless Sweet Potatoes. Genuine—no yams. Address with stamp, for full particulars, the only original introducer and grower, G. CAMERER, Box 72, N. Madison, Jefferson County, Ind.

Mention American Gardening when you write.

**ALL THE LATEST NOVELTIES** AND PLANTS THAT CAN'T BE HAD ELSEWHERE. Cannas, Italias and Austrias, at \$1 each. New Roses, New Fruits, New Shrubs, New Bulbs. 10 Cents for \$1.—5 for \$4 cts. Book on Cacti 110 pages, 120 cts., 10 cts. Catalogues of New and Rare Plants, Cacti and Bulbs free. **A. BLANC & CO., Philadelphia.**

Total value, - **\$2.50**

**\$1.00**

under the terms of this offer, therefore, gives you **AMERICAN GARDENING**, the brightest gardening paper issued, one year, and sufficient seed to start a goodly sized garden with some to spare for your friends. We look for thousands of responses to this the greatest bargain of the season.

## THE SEEDS OFFERED

are not of the cheap varieties which one finds advertised and described in glowing terms in all the papers at this time, but are full-sized packets, of the most reliable sorts, such as we put up for the Trade. There is not one cent of profit to us in this offer; in fact we lose money on every order we fill, but in these days it is necessary to make some sacrifices to promote business. We want to obtain new patrons to whom to send our 1897 catalogue, and take this method as the most direct means to accomplish same.

### THE FOLLOWING IS A LIST OF THE PACKETS:

**Alyssum**, Sweet. Good border plants.  
**Asters**, fine mixed. Select strains.  
**Balsam**, Lady's Slipper. Finest double mixed.  
**Calendula**. Needed in every garden.  
**Candytuft**, mixed.  
**Carnation Marguerite**, Mixed. A genuine novelty for the garden.  
**Batchelor's Button**. The German Emperor's favorite flower.

**Cosmos**, mixed. The pride of the Fall in the open garden.  
**Larkspur**. Fine for mass planting, the herbaceous border, or a rock garden.  
**Marigold**, French varieties.  
**Mignonette**, most fragrant of all plants.  
**Nasturtium**, assorted colors.  
**Pansies**, Giant strain, assorted colors.

**Petunias**, in superb mixture.  
**Phlox Drummondii**, choicest strain, elegant for bedding.  
**Poppy**, Elliott's mixture, double flowering.  
**Sweet Peas**, in mixture, including all the standard varieties.  
**Ricinus**, Castor Oil Plant. For sub-tropical effect, very showy.

The above collection is all of choice, fresh seed, in full packets, such as retail at Ten Cents each, and is not made up of cheap, unreliable or worthless stock. Our reputation in the seed trade for the past fifty years is our voucher.

If you are already a subscriber to **AMERICAN GARDENING**, but want the above collection, it will not take you ten minutes to obtain the subscription of some one interested in gardening. Send in this new name, together with \$1.00, money order preferred. Orders filled without delay. Paper and seeds sent to separate addresses when so requested. Address

**WM. ELLIOTT & SONS, SEEDSMEN, 54 Dey St., New York.** Est., 1848.

# Corn

is a vigorous feeder and responds well to liberal fertilization. On corn lands the yield increases and the soil improves if properly treated with fertilizers containing not under 7% actual

# Potash.

A trial of this plan costs but little and is sure to lead to profitable culture.

All about Potash—the results of its use by actual experiment on the best farms in the United States—is told in a little book which we publish and will gladly mail free to any farmer in America who will write for it.

## That Plant Registration Bureau.

In response to your request for my views upon the proposed establishment of a bureau of registration for varieties of horticultural plants, I may say that I have already pretty thoroughly expressed myself upon the subject, giving at the same time what historical data I was able to collect. These notes will be found in my "Annals of Horticulture for 1890.

I look upon a bureau of registration as a means of collecting and preserving knowledge rather than as a means of protecting the originators of varieties. I believe, however, that the existence of such a bureau would result in a great incidental advantage to originators, for the public would soon learn that those originators and introducers who are willing to make the most complete and careful record of their novelties are the ones who, as a rule, are to be most fully trusted. Varieties are not entities like machines; they are not fixed and invariable but they vary under the influence of every modification in soil, climate,

and cultivation, and they cannot therefore be patented as inventions are.

I was not present at the meeting which adopted this proposal for a bureau of registration, and was not aware that I was placed upon the committee until informed some time

after the meeting by the chairman, yet I am most heartily in sympathy with the proposition, as I understand it.

I do not understand that there is any desire to attempt to compel people to register their varieties, as one of your correspondents fears; and there certainly can be no successful attempt to copyright a variety itself. The nearest that we can come to such protection is to copyright the name and to use that name as a trade-mark. It is certainly true that a variety may originate more than once; that is, that plants which are so near alike that there is no commercial difference between them, may originate in different parts of the country. This being the case, it will be seen that no man can have the exclusive right to any particular type of plant. A discussion

FIG. 27.—FRUITING BRANCH OF PHYSALIS FRANCHETII. (See Page 85).

of this very point respecting the origin of varieties is discussed in chapter 11 of my "Survival of the Unlike," but leaving aside all this matter, the collection of specimens, photographs, and descriptions in the hands of a bureau of registration would give us an inexhaustible repository of information, and could not help but result in incidental and very substantial recognition of the introducers of novelties. Rather than acting as a discouragement to experiment as one of your correspondents suggests, it would result in a direct stimulus thereto; but I am free to confess that it might discourage the dissemination of various novel names of old varieties.

L. H. BAILEY.

## Peninsula Horticulturists Talk.

Hon. J. S. Willis, Congressman from Delaware, made the address of welcome at the late meeting held at Milford, and Prof. J. S. Robinson, of the Maryland Experiment Station, responded.

In his opening address, Prof. Van Deman, formerly United States Pomologist and now president of this Society, made the remark that a "lover of fruits was not a bad man."

### Spraying.

Discussion brought out the fact that sprayed trees not only produced more marketable fruit, but fruit of better quality that would both ship and keep longer. Prof. Powell said they had no slack barrels since they had sprayed. The fruit was solid and bore shipment better than unsprayed. They had Spitzenberg trees that bore the eighth consecutive crop the last year of ten to fifteen barrels of apples to the tree; fruit of the very highest quality.

S. H. Derby showed Winesap from sprayed trees 50 per cent. finer than Winesap ordinarily is. Also Jackson, sprayed, and from trees affected by cedar rust. He also read an able paper on apples, and from his experiments thought it possible to have fair crops of apples every year, if the orchard were properly cultivated and sprayed. The sand storms had damaged the buds somewhat the past spring, thus preventing a full crop of fruit setting. Trees must not be sprayed while in bloom, or harm will result.

Prof. F. D. Chester, of Delaware Experiment Station, gave the results of his spraying on apples the past year. Thirteen baskets of Winesap apples of first grade were obtained from a sprayed tree; three baskets from an unsprayed tree, and much poorer fruit. All solutions injure peach foliage more or less.

### Pears.

Asked for a list of pears for market, Capt. R. S. Emory said he would plant Manning, Bartlett, Duchess, Keiffer and Lawrence. Dr. Black and J. S. Harris corroborated this list. There was no early pear yet tested of more value than Manning. Lawson was a good grower, and in some instances gave good crops of beautiful fruit, but whether the market would take it or not remained to be seen. It was some time coming into bearing. Koonce was new and not fruited. The Alamo, of Texas, was very similar to Bartlett in every way. Prof. Heiges, United States Pomologist, said the Summer Beauty, a new pear from Texas, was very early and a fine pear every way. Moore's Sugar was better than Seckel and larger. In fact, he knew of no better pear in quality; ripens with Giffard.

### Crops for Profit.

The consensus of opinion was that fruit culture paid better when diversified, unless one was peculiarly situated. Although the late Col. Wilkins, of Kent Co., Md., had cleared from a single peach crop from 105,000 trees \$103,000, Mr. Harris said we need not look for the same profitable crops of peaches as in former years. Railroads had opened up new localities which brought fruit in competition. He said the best thing would be to lengthen the season at each end by the introduction of better varieties than we now have. As an inducement he proposed offering premiums to such as

would introduce better varieties than we now have, and a resolution to that effect was passed.

### Peaches.

Prof. Powell said that the shoots coming below the bud in seedling trees was no indication of yellows although it had been so considered in former years. It was caused by the process of budding, the string used in tying the bud causing a girdle; trees not budded did not show this. Prof. Wait said Georgia growers universally planted small trees, and made as good orchards out of them as from big trees. Some growers preferred small second or third grade one year old trees, while others planted June buds.

### Root Pruning.

Mr. Derby had practised cutting off most of the roots when planting. His per cent. of loss by transplanting was small and trees had made an excellent growth. If a tree showed roots on one side and none on the other he simply cut the bark a little, causing new roots to start and sufficient roots all around the tree was the result. Prof. Powell was trying an experiment with 500 peach, apple, plum, and pear trees, and grape vines on two different kinds of soil to determine if the Stringfellow method of root pruning were desirable here.

### Marketing.

C. J. Monroe, of Michigan, read a paper on methods in marketing, and said the California growers had to transport 48,000 lbs. of dead weight across the Rockies in order to get 24,000 lbs. of fruit into Eastern markets. The growers each took their fruit to a central house where competent packers packed and graded it. The grower was too apt to overlook a blemish that a professional packer would not. In Michigan Mr. Stearns made personal visits to his customers and asked them to report any badly packed fruit. Another grower stayed at the commission house and guaranteed his fruit, refunding money if not as represented. At least one-tenth to one-quarter of fruit brought to the packing house was rejected. A leading commission man had told him that there was a market for about 5 per cent. of the extra grade of fruit, for 75 to 80 per cent. of the prime or second grade, and the poorest grade made up the balance. It was for the medium grade consumed by the masses we should try to get the bulk of the prices. Dr. Black thought it would pay good packers to go to the growers here and pack the fruit. Mr. Rosa said in his paper on marketing, that railroad charges must come down if the growers were to expect profits. Cost of production was at the lowest notch and so was labor. The grower must either produce fruit in carload lots, or combine with others and secure them. Then select a market and send all goods there. Mr. Woodall believed we should centralize markets and draw buyers to them, thus getting rid of any responsibility of shipping. No freight, cartage nor commission was to be deducted in this case. The buyer took the risk. Mr. Slaymaker said the loss of the Fruit Exchange was one of the greatest we had experienced. President Van Deman said it was impossible to unite farmers and Mr. Derby thought the only thing needed was money like the steel trust, to put backbone into the combination. Capt. Emory said there was no law to compel us to grade fruit; grade it ourselves and grow only the best. Prof. Robinson said growers must have a thorough knowledge of markets. Some required one sort of package and others did not. The first peach trees ever planted in Maryland were planted at Cassey's Wharf, Cecil Co.

### Commercial Floriculture.

Jos. Heacock, of Jenkintown, Pa., read an interesting paper on "Commercial Floriculture." He used dry Cypress for building greenhouses, and Red Cedar posts. Walks were 22 inches wide; buckwheat coal costing \$1.90 per ton laid down, was used.

Select an old sod; plow, harrow, and cover completely with cow manure; harrow thoroughly. This was used in the greenhouses to grow the flowers. Roses, Chrysanthemums, Violets, and Carnations were the principal crops. Had taken \$5000 in a single season from two houses. Has 1 1/4 acres under glass.

Varieties of Roses grown were Bride,

Bridesmaid, American Beauty, and Meteor. Tobacco stems are kept spread along the walks to keep insects in check. Fumigating is sometimes resorted to. Sells wholesale in Philadelphia, but has customers 100 miles away. The grower must have experience, either his own or pay for it, and must be near good railroads.

### Crimson Clover.

H. W. Collingwood said the Peninsula farmers had largely decreased their fertilizer bills since its introduction. Now when the farmer needs a fertilizer he simply buys what he needs for some special crop. He also said there was no locality where such a variety of crops could be produced as here. Anything that grew in a temperate climate could be produced here with more or less degree of success, and the only drawback was the one railroad. Give us railroad competition and there was no other locality that could equal it.

### Grapes.

J. E. Carter reported for the committee on grapes. He trained on the Kniffin system arms 2 1/2 feet long. Three hailstorms had about ruined the crop the past season. In spite of this, had netted \$70 per acre. Sprayed with Bordeaux mixture twice before blooming and twice after. Moore's Early was the best variety, Niagara next, and Concord third. A number of new varieties are on trial. Moore's Diamond is not equal to Niagara. Uses scarlet clover, kalmint, and rock as fertilizers. Mr. Killen still regards Concord as his most profitable variety; sold his grapes the past season for \$40 per ton. Mr. Gulick has found Prof. Munson's new varieties to succeed admirably here.

### San Jose Scale.

Prof. Johnson gave a complete history of this. It is found on apple, pear, plum, peach, and cherry trees, black raspberry, currant, and gooseberry bushes, and even crab grass. It was discovered at San José, California, by Prof. Comstock in 1880, and is one of the most destructive insects known. Does not come from eggs, but is born alive; the male insect rarely seen, and does not live long. The female does the damage, and the progeny of a single female is 3,216,000,000. Travels very little, not more than a foot in 24 hours; is transmitted by contact, on nursery stock, by the winds, and by birds, also on specimens of fruit. Insects injurious to the scale are numerous, but not entirely satisfactory as remedies.

Capt. Emory said a spray made of whale oil soap, if it could be had pure, was most efficient, but too expensive. Nurserymen outside the State were ready to co-operate with them, and have stock examined before shipment. Prof. Powell advocated the State paying for the infested trees, and having all destroyed before the scale got a foothold. He said this was the cheapest plan.

### Plums.

Mr. Kerr said it was a fact that red plums of the Wild Goose type had sold higher the past summer than either blue or green of the domestic type. The market demanded a red plum. He had found natives far superior to others, and was digging up other sorts. Milton averaged larger than Wild Goose, and was earlier. Smiley was the best to pollenize Wild Goose and others of this type. The six Japan varieties he would advise to plant were Yosebe, Red June, Abundance, Berckmans, Maru, and Chabot ripening in order named; Willard was of little value.

### Nuts.

J. W. Killen reported he had five varieties of hazel, 14 of chestnuts; besides several of pecans, Persian Japan and Black walnuts, butternuts, and shellbarks. He showed specimens of the Killen, a new Japan chestnut measuring 6 1/4 inches in circumference. Quality equal to any native chestnut, also Ridgely, and a single burr of Paragon, with seven large nuts in it. Col. J. T. Wright, of Laurel, Del., showed a seedling pecan grown there. Tree is 14 years old, and has produced nuts for four years, producing half a bushel in 1896. Nut very large and thin shell, of the finest quality; almost as large as Stuart. The tree is a good grower. English walnut trees are now growing in the State, measuring near 2 feet in diameter, and producing good crops of nuts.

## How to Apply Manure.

It is at once clear that a nursery affords some special advantage in the study of the manure question. Here trees and plants are dug up at their feeding stage, in a way that hardly obtains with another crop. One can see what an apple tree or strawberry plant likes to feed upon and in what shape, as is not likely to be the case with a cabbage or a tree in the orchard, which are not dug from the earth.

Many years ago I learned a lesson in the application of manure. It was when, as a boy in my father's nursery, I began to take a hand in the operations. We purchased from a tannery a large pile of compost, hair, ashes, lime and other refuse, with enough bark in layers to make all pile up well. In the winter we drew this on land

say that the surface application of manure is the more rational method, because the strength of the manure can only go one way, namely, downwards to the roots. The avidity with which roots seek out and lay hold of particles of manure in the case stated showed to me that there can be no mistake in putting the plant food right where it will be needed.

With the surface application of manure in the fall and winter there is often great loss of fertility, through escape by leaching and surface drainage during thaws in the winter. If it be drawn to the plat and be kept in piles until just before spring plowing or cultivating, such loss is not appreciable.

The question of the comparative merits of surface manuring and the plowing in of manure may depend somewhat on the crop also. It is plain

squashes, and cucumbers. Of such the extent of the crop is almost measured by the amount of manure, and thirty to forty tons per acre each year is none too much.

The bush small fruits need less manure than do strawberries, while in vegetables, potatoes, peas, parsnips, carrots, beans, tomatoes, and melons get along very well with one-half the manure called for by the others named. While I am not ready to agree that good tillage will make up for shortage in manure, yet no one can go further than I in faith in good culture. It greatly supplements the effects of free manuring. By good tillage I refer both to deeply stirring the soil and to complete surface culture.

In the frequent trips I make past some of the most successful market gardens of Buffalo I have often wished that the young men throughout the country who aspire to be successful market gardeners could be impressed by the two fundamental planks of success witnessed here, namely, the most liberal annual manuring and the most perfect tillage. These two things accomplish wonders for the produce garden.

ELIAS A. LONG.

FIG. 28.—A LESSON IN MANURING.

devoted to nursery and other crops, usually plowing it under in the spring. Sometimes on fall-plowed land we would incorporate the mixture with the soil, by the use of the cultivator or share harrow, in the spring.

One of the things that vividly impressed me as we dug trees and plants from soil thus manured was the way in which rootlets would lay hold of congenial bits of plant food; the tufts and felted knots of hair would be the attraction to a mass of small roots. This is illustrated in the accompanying sketch, in which A A A show bunches of hair. This thing was seen not only in the case of seedling and tree roots, but also in those of strawberry plants, which lie much nearer the surface.

A lesson to be drawn from this is that the plowing in of manure as a method of applying it should not yield to surface applications in any marked degree. We meet with persons who

in the case of shallow-rooted crops like lettuce, radishes, onions, strawberries, etc., that the manure is not wanted at the same level as with parsnips, cauliflower, and other deeper rooters. Then, again, surface manuring may, as in the case of strawberries, serve an excellent purpose as a mulch in keeping the soil cool and in preserving moisture.

Another thing I have learned as regards soil fertility is that all crops do not need the same amount of manure. It is a poor plan, for instance, to be lavish in the use of manure on potatoes, and then slight it on onions and celery. I have grown better potatoes on common farm land than in a garden that has been treated to forty loads of manure per acre.

Among crops that do the better for high feeding I would place strawberries, celery, onions, lettuce, spinach, beets, radishes, cabbage, cauliflower,

## Lawn and Flower Garden.

**Lawn.**—Last season I used wood ashes for top dressing the lawn; the result was so satisfactory that throughout the hottest part of the summer the grass was of a beautiful bluish green color. When there is a large area of lawn to be treated, a horse machine, such as is in use for sowing fertilizers, is the best method for distributing the ashes which are best put on in the spring, and before raking off the rubbish, for in the ashes I find nails and scraps of iron which would sadly injure a mowing machine; if the ashes be put on before the raking these can be easily removed. For a small lawn, handle with gloves, for the ashes are injurious to the hands.

**Tubs and Boxes** for piazza walls, and the decoration of the lawns can now be made, and old ones repaired and painted as required. Tubs in which plants are set out should not be of a glaring color; a red tub to my taste borders on vulgarity, the first thing the eye rests on is the tub, and the plants set in a vessel of such a color must be most attractive to get even a second place. Locust bark fastened onto boxes and tubs has a natural look, and gives a picturesque appearance to all. Portions of tree trunks left in place for setting tubs on can be made beautiful by planting Ampelopsis Veitchii around them.

JOHN SHORE.

## The Gardener's Bank.

The great and only secret in gardening lies in the enrichment of the soil; it cannot be made too rich. Anything that decays within a reasonable time should be added to that bank of all banks—the Compost Bank. Stable manure, leaves, woodpile dirt, waste water from house, weeds, in fact everything useless for any other purpose, should go to the Bank; it cannot be made too large. Land plaster or kainit, sprinkled over, will prevent offensiveness, and it, instead of the pocketbook, can be drawn upon at any time, for the best of fertilizer. Some writers advocate the application of green manure direct. Don't do that in the garden, if quality is desired; many vegetables seem to absorb an amount of undecomposed matter, that develops unfavorably in cooking; cabbage notably so, turning red and strong smelling; potatoes get diseased, etc.; plants become weakened and fall an easy prey to rust, blight and insect enemies. Whereas, if there is a surplus of food, fully decomposed in the soil, ready to be taken up, the plant will outgrow almost any enemy that it has, and mature perfectly.

## The Fruit Garden.

**Quick Crops.**—Knowing that apple tree planting is commonly looked upon as planting for someone else, I append a few notes, showing what common nursery stock planted in the fall of 1890 has done. The height from ground to first branch varies from 2 feet to 4½ feet. The last three were again transplanted in the fall of 1893.

Variety.	Spread of Branches.	Clim. of Trunk.	First Fruits in.
Greening.....	19 ft.	21 in.	'95
Baldwin.....	14 "	19 "	'96
Hubardston.....	12 "	16 "	'94
King.....	17 "	18½ "	..
Early Harvest.....	13 "	17 "	'94
Roxbury Russet.....	19 "	19 "	'95
Jersey Sweet.....	13½ "	17½ "	'94
Pound Sweet.....	10 "	11 "	'95
Spy.....	10 "	14 " trans.	'98
Newtown Pippin.....	12 "	10½ "	'96
Grimes' Golden Pippin.....	9 "	14 "	'96

These have not been staked or had braces to spread the branches at any time.

**Pruning Young Apple Trees.**—How different in style of growth they are. To tell a person how to prune the trees when received from the nursery is very simple, but to carry on the treatment necessary for eight or ten years after, is neither simple nor easily explained, which is thoroughly understood by a large class very much interested in garden work, but yet cannot be called professional gardeners; to such and some of my younger brethren I pen these few remarks. Surmising that the tree is a standard, and has made one season's growth in the garden, and has a number of clean shoots, select four or five which are located 6 or 8 inches apart on the main stem, and growing directly outward, then cut out all the others, do not merely shorten them back. For the second summer give the trees a heavy coat of rotted manure, fork in lightly, and put on the mulching again, and cultivate close up to the tree all summer. The pruning next in order for the third season will be by selecting the best placed shoots to fill in between the leaders, and cutting out others. Keep the tree looking thin. Don't prune back for fruit spurs, but follow up last season's plan, and the following spring you should have a young tree of some proportion and beginning to show the characteristics of that particular variety, which will become more clearly seen each year, and which it should be the pride of the owner to retain when pruning in future.

Let us now look at a few of these trees two years later, taking Spy, Baldwin, Early Harvest, Roxbury Russet, and King as trees of different styles of growth. The Baldwin will strike the eye as the most ordinary of the trees. A great growth of wood, but no sign of fruit. Spy might be a soldier at attention, judging by the stiff upright growth, but here again indications for fruit in the near future are absent. The appearance of Roxbury Russet nearby is so totally different that you intuitively feel that it is a more matured tree, and on closer inspection find along the stems of the older branches many little, short, stubby, fruit spurs. The general contour of the tree gives the idea of lack of small twigs or fullness, yet there is a certain grace in the curve of the branches which is missing, as we turn to examine the growth of a King, which we sum up as spare, lean, and ungainly. Here are the stubby spurs again, but showing only on the wood made one year ago. In striking contrast to all is the Early Harvest, willow-like, with many branches, twigs everywhere, and looking as if its main object were making wood, and that only. Here the shears have to come into play to get light into the center of the tree. In doing the thinning we observe that many of the light shoots and some of the leaders are finished up with a plump, rounded, flower bud.

Thus it will be seen each tree must be known by the operator when pruning; he should endeavor, 1st, to get wood; 2d, to get the fruits for his labor in the shortest time, which cannot be had by the starvation process. If by extra good treatment your trees are making at the bearing age unusually strong, sappy wood, treat as advised in "Fruit Garden" for January 2.

If a Nut or Screw persist in working loose in your pruning shears, take it out and dip the thread in varnish; screw into place, and don't use the shears for a day or two.

J. HOLLOWAY, L. I.

## The Vegetable Garden.

**Hotbeds.**—Those who have to depend entirely upon hotbeds for their supply of early plants, should now commence their preparations. One frame of about twelve square feet will be found large enough for a starter. A few weeks later, or as soon as the seedlings are large enough to transplant, others could be made to supply the space needed. A very satisfactory method of making hotbeds was described and illustrated in these columns, issue of January 23. At this season, many days will follow which will be too cold to admit of any fresh air being put on, the ammonia from the hot manure must be allowed to escape, otherwise bad results may follow. To avoid this risk I have frequently put on a ventilator on the highest point of one of the sides, made of four boards 24 inches long and 4 inches wide, this is connected by a hole cut into the side-board of the frame, and the whole nailed to the frame; through this the ammonia gas will steadily escape, without chilling the interior air. The ventilator may be stopped up during cold nights and left open during the day.

**Tender and Half Hardy Plants.**—I have frequently seen amateurs make the mistake of sowing tender plants of a tropical nature, such as egg plants and tomatoes, in the same hotbed as the hardier cabbages, lettuces, etc., a practice which results in disappointment and the seeds being unjustly condemned. It is important that all should learn the nature of whatever plants they endeavor to cultivate, as an aid to the prevention of mistakes. Wherever such a lack of knowledge exists, cultivate the friendship of some neighboring gardener, and I am sure he will be pleased to make any suggestions necessary. Ordinarily it is not advisable to start these tender plants in hotbeds before March 20 in this latitude; they are very sensitive to chill or damp, and if they receive any check they seldom recover satisfactorily.

**Onions.**—A sowing now in a shallow flat, placed in a hotbed, and transplanted into other flats as soon as large enough, then steadily hardened 'by exposure to abundance of fresh air after the middle of March, and planted out as soon as the weather is favorable, on well enriched and deeply dug soil, will give fine onions for exhibition; and a very satisfactory crop, if a large variety as the Prizetaker is selected. Grown in this way, onions are not so subject to attacks of the maggot or rust.

**Parsley.**—Parsley takes such a long time to germinate and grow large enough to be fit for use, that it is a good plan to start a few seeds early, to be transplanted to the open ground in spring.

**Radish.**—A sowing of Early French Breakfast made now in the hotbed, will soon give roots fit for the table; they should be sown thinly.

W. M. EDWARDS, R. I.

### Readers Mean Business.

My advertisement in AMERICAN GARDENING last year has given me the most satisfactory results. Your readers mean business.—G. CAMERER, North Madison, Jeff. Co., Ind.

## Chrysanthemums.

A paper on this subject was read before the Massachusetts Horticultural Society on Jan. 25, by E. M. Wood of Wellesley. After having briefly sketched the history and peculiarities of the flower, Mr. Wood continued:

"Within a radius of ninety miles of Boston the chrysanthemum is grown to a perfection nowhere excelled in this or any other country. The cultivation of the chrysanthemum for blooms for the market and single specimens for exhibition is given more care and attention than any other branch of the industry. The culture of the flowers for exhibition alone has been elevated to the dignity of a fine art, and is a most arduous task. Exhibiting to-day is by no means what it was, and the gaining of prizes has become a difficult feat.

"As eternal vigilance is the price of liberty, so unremitting attention is the price of success, as far as the chrysanthemum is concerned. It possesses a voracious appetite, and requires to be fed with as much regularity and care as a suckling infant. It is dainty in its food and is a gourmand as well as a gourmet. It must be fed upon the very best soils, manures, etc., and its drinks must be rich liquids and plenty of them. Proper drainage is an essential requisite, in order to insure that the plants shall not become 'waterlogged.' Cleanliness is an essential point; never use a dirty pot or box, or the roots will cling to the sides and undergo a check from being broken in shifting to larger sizes. In the cultivation of the chrysanthemum do not attempt too many varieties, as many, perhaps even three-fourths, of the new sorts sent out are not equal in merit to the older varieties.

"Every grower is aware of the tendency to 'sport,' that is, a plant which has always yielded flowers of a certain color, produces others of a different hue. Many of these sports when 'fixed' are improvements, and cuttings taken from the branch which 'sports' will usually produce flowers of the same color again. If they and the plants raised in turn from them continue to do so, the departure becomes a permanency, and the sport is said to be 'fixed;' it receives a name, and is introduced into the market. Sometimes the sport reverts to the original color and becomes worthless. There is no reason why a new variety obtained from a sport is not as good as one obtained from seed. Growing plants to produce large blooms is not favorable for increasing the number of new varieties by sports, as the plants are denuded of the side shoots, as they grow, from which the largest number of sports are obtained. In the Japanese class the fewest sports are found. Sports are usually counterparts in foliage and habit of their parents; and some possess better constitutions and finer flowers, and are improvements upon their parents. Most chrysanthemums in cultivation, however, have been raised from seed at one period or another. Until recently the English gave up growing plants from seed, as their varieties would not ripen the seed in the damp and unfavorable climate of England, but Americans have supplied to the mother country several hundred varieties with stronger constitutions, enabling seed of the chrysanthemum to be again grown in England.

"There is one thing to which I wish to call special attention; it is the unsightly staking of chrysanthemum plants with willow and other stakes, reminding one of a cripple supported on crutches. They have neither grace, finish nor even presentable foliage, or flowers with either form or coloring. If judged by a correct standard of coloring and finish or foliage, all would be condemned, and relegated to the rear. I trust the coming season that plants will be judged by a standard of blooms, by finish and luxuriance of foliage, by the form and color of bloom, and that the plant shall exhibit only its foliage and flowers, and not a forest of unsightly sticks supporting a weak stem with little or no foliage and colorless flowers."

# Novelties of the Season.

*In this issue we commence the presentation of a selection of the novelties of the season, as seen in the various trade catalogues and lists. The present series will be followed up by others during the next few weeks, when fruits and vegetables will also be included. The descriptions given are those of the introducers.*

## The New Seedling Variegated Leaf Canna JOHN WHITE.

In the Fall of 1894 this novelty in cannas originated in a batch of seed taken from Emile Leclerc. Since that time it has been severely tested both under glass and in the open with most satisfactory results, retaining its color under all tests and standing the sun exceptionally well, making it very valuable as a decorative bedding plant for outside work, as well as exceedingly valuable as a pot plant for conservatory and greenhouse decoration. The leaves when young are of a pale yellow, with narrow margins of dark red, the yellow surface being dashed and spotted with green. They retain this color until they gradually mature by losing the yellow and gaining a deep suffusion of pink, with an admixture of green, later becoming green and yellow. The plant in this condition is decidedly striking and novel, and arrests the attention of plant lovers the moment they come in contact with it. It reproduces itself perfectly

from seed. It is of dwarf habit, attaining a height of about 3 feet, and growing strong and vigorous. The flower is a bright scarlet, and although small compared with the large varieties, it has a peculiar value of its own in that it shows such a contrasting decorative effect among the light and beautiful foliage. Without doubt it is a variety that progressive florists cannot afford to be without. (fig. 29.)

From Price List of John White, Elizabeth, N. J.

## PHYSALIS FRANCHETTI

So-called from physa or bladder, alluding to the inflated calyx; ground or Winter cherry, Ord. Solanaceae. This particular species is a native of Japan and China, and has only lately attracted attention. It is in every way superior to any other species known, the flowers being a pure white, the leaves large, of a beautiful light green, very ornamental. The flowers are solitary in the axils of the branches. The inflated calyx forms around the blossom as the seed or berry ripens, growing larger and of a more brilliant red on reaching maturity. The color is of the most intense and brilliant scarlet, and as the time of its fruiting falls in the Winter or Christmas holidays, its growing in greenhouses could not fail to be of value. Another point to recommend it to the grower is its easy propagation, and its adaptability to any common soil. If cut and placed in a vase without water a useful winter decoration may be had. Propagation is effected by seeds or division. The calyx, if left on the plant, will in due course become skeletonized, affording another pretty change in the appearance of the plant. The physalis is a half hardy perennial.

The great beauty of the calyx is lost in the picture (page 81), as the superb coloring which constitutes its chief beauty cannot be shown.

From H. H. Berger & Co., San Francisco, and other introducers.

## DWARF PAPAYA (CARICA PAPAYA.)

A magnificent bedding plant for the north, of the easiest culture, as easy to grow as a ricinus. It forms a branchless palm-like trunk, crowned with a magnificent head of the grandest leaves, each 2 to 3 feet in diameter, deeply cut and divided, and on petioles 3 or 4 feet long. The leaves are of a rich, dark green color, with white midribs and veins, forming a beautiful contrast. The plant is dioecious, the male and female flowers being produced on different plants. The male flowers are produced on long racemes, are pale yellow and waxlike, somewhat resembling in size and shape those of the Catalonian jessamine, and are most exquisitely fragrant. The female flowers are much larger, are produced in small clusters at the base of the petioles, and are succeeded by most curious and odd melon-like fruits. The male plants are the most beautiful, and the flowers are produced in such extreme abundance, that a good sized plant will have thousands of flowers and buds on it at once, and so fragrant as to perfume the air for yards. Each raceme continues to produce flowers until the end of the season. They are splendid for cutting, lasting for days.

Not only is this one of the grandest of all bedding plants, but it is also a very valuable decorative plant, somewhat resembling a palm, and quite as beautiful, attaining a large size in a short time. No plant is easier grown bedded out.

We have spoken of its merits as an ornamental plant only; it also has its uses, producing a beautiful large orange colored fruit, large as a musk melon, exceedingly rich and spicy, and sometimes called vegetable pepsin, from the fact that the fruit is a remedy for indigestion.

Description furnished by The Rose Valley Nurseries, Dongola, Ill.

## Gold Medal Rose "Jubilee."

This grand rose was raised in 1892 by Mr. M. H. Walsh, gardener to Jos. S. Fay, Esq., Woods Holl, Mass., and is a pedigree seedling—Prince Camille de Rohan x Louis Van Houtte. It was first exhibited before the Massachusetts Horticultural Society, July 1, 1893, and even at that early stage of its development it was deemed so meritorious that it received a "first-class certificate of merit." Exhibited the following year, June 20, 1894, it sustained all that had been expected of it, but the special committee decided to subject it to another year's trial before passing upon it, for a rose that may win the "gold medal" must prove its worth by every test before the award is made. It was exhibited again on June 15, 1895, and commanded unbounded admiration. A special committee of experts visited Woods Holl to inspect it growing in the ground, and so, after three years of probation, it was triumphantly and deservedly awarded the Society's gold medal.

A technical description of the "Jubilee" rose is as follows: It is a true hybrid remontant rose, perfectly hardy, blooming in the Fall as well as in the early Summer, very vigorous, large, dark green foliage, one of its distinguishing features; short-jointed, long flower stems, and branches freely, blooms most abundantly, three flowers and over on each shoot, the ideal habit for a hardy garden rose. The flowers are very large, reaching six inches across under good culture; outer petals partially reflexed and recurved when the flowers are mature, the center petals upright and very gracefully disposed, giving grace and finish without showing the center; they last a long time when cut. The buds are long and rounded, the petals falling away gracefully, revealing the rich velvety texture and grand coloring. The fragrance is strong, delightfully rich and very lasting.

The rich coloring and soft velvety sheen are beyond description, and must be seen to be understood and appreciated. A pure red in its deepest tone, shading to deep crimson red and velvety maroon red in the depths of the petals. "The coloring is alive," as one expressed it. "It fairly glows in its rich warmth of coloring," another said. The rich velvety finish to the petals is all its own, and is not even approached by any other rose yet introduced. It is admirable, unique, and, as Mr. F. Schuyler Mathews, the celebrated artist, said: "This rose contains the darkest color, combined with pure color, of which nature is capable." It required centuries and the skill of the world's hybridizers to produce this peerless rose, perfect in all its attributes, peerless in its magnificent color, and it is fair to assume that it will again require the centuries to produce its equal—if it ever is produced—for nature is not prolific in repetitions.

*From the Catalogue of Peter Henderson & Co.*

## Violet PRINCESSE DE GALLES (Princess of Wales).

Though not a novelty in the strict sense of the word, this beautiful violet, which is comparatively new, we consider worthy of a place in our Novelty Supplement, the aim being to bring it more prominently before our readers, which it certainly deserves. Princess of Wales, as we have seen it grown, is probably the best single violet on the market to-day. It is of a vigorous growth, a very profuse bloomer, the stems being often over a foot in length. The flowers, as seen by the picture herewith presented, are very symmetrical, very large in size, one and a half inches in diameter not being uncommon, and have an extremely delicious fragrance. It is being introduced by several houses. (See fig. 33 page 92.)

## ASPARAGUS SPRENGERI.

The more this valuable new decorative green is seen, the more it is appreciated. Introduced by us only about a year ago, it is already grown by the thousands. Indeed, one enterprising Philadelphia florist recently bought 7,000 plants of us.

Our illustration hardly conveys a perfect idea of this beautiful plant. Its gracefulness and bright color always elicit exclamations of wonder. When well grown, it forms immense specimens in a couple of years, that will produce cut sprays 6 to 8 feet long. These remain fresh for much longer than any other green; in many instances for six weeks. As the roots are tuberous, the plant is able to stand heated atmosphere with greater impunity than can palms, ferns, etc. (fig. 30.)

*From the Catalogue of A. Blanc & Co., Philadelphia.*

## New Carnation HARRISON'S WHITE.

This variety has excited a great deal of interest among carnationists, the announcement that it is a pure white sport from Scott being in the main responsible. Sports from Scott are by no means uncommon, but the most of them are only variations in shade, being either darker or lighter pinks. All such have been of but little importance so far. Three years ago this white sport appeared on a Scott plant. Mr. Harrison took great care of the cuttings, and succeeded in obtaining nine plants. These were well cared for, and the result is to-day 1500 healthy plants, bearing large, well-formed flowers in great profusion, of great purity in color; and despite the fact that the plants are being largely used to supply cuttings, the flowers maintain their size to a marked degree. Much has been said about the character of the bloom and its similarity to the parent, also the nature of the growths. Experts have examined these with the result that the flower is pronounced similar to that of the parent. However, on Mr. Harrison's place, there is this distinction, it is much more robust than his regular Scott in other houses, but when the pipe, stems, grass, leads and breaks are all compared with those of Scott, they are none other than the same thing. The flower stem and the calyx are absolutely identical with the parent, but the petalage, in some instances, varies, being slightly flatter and broader, and the serrations are not so finely toothed or cut, yet many blooms can also be found with the same build, form and contour, this being more apparent now than in the early season. These slight variations in petalage are of no consequence, but rather help the flower than otherwise, giving it a larger spread and better appearance than the variety from which it has sported. The plants are singularly healthy and propagate well.

*John Harrison, Jersey City, N. J., originator and introducer.*

*New Dwarf Early Flowering Cosmos Dawn.*

free bloomer, color pure white, with a tinge of rose. Begins to bloom in July and lasts until frosts cuts it down; it is always loaded with flowers, and is not apt to be blown over by the wind, as the old tall variety." (fig. 31.)

*From the catalogue of Henry A. Dreer, Inc., Phila.*

### NEW DWARF EARLY FLOWERING COSMOS "DAWN."

This new variety of Cosmos comes into full flower in July and continues a mass of bloom until cut down by severe frost. This feature alone is sufficient to stamp it as a novelty of the first class and will make their successful cultivation possible in the most northerly states and Canada; but added to this, it is of dwarf, compact growth, growing only 4½ feet high, while the old variety, growing alongside, towers up nearly 7 feet, a victim to the first strong wind. The flowers are fully as large as in the best selections of the old type, the color is a beautiful white, relieved by a delicate tint of rose at the base of the petals, altogether the finest novelty introduced in many years. The originator, who resides in Northern New York, writes about it as follows: "Originated from seed purchased from your firm (H. A. Dreer) four years ago. We got only one plant out of the lot and saved the little seed therefrom to try another season. All the plants raised from this seed began flowering in July, and none of them reverted to the original late flowering type; it has acted this way ever since, and is certainly a great improvement on the original for our northern country, as we rarely can flower the common kind, they being cut down by frost before fairly in bloom. Plants of the new variety grow no higher than 4 feet 6 inches, while the late flowering kind is more than 7 feet. It grows more compact and bushy. The flowers are as large as in the old variety, the petal being rather broader, which makes the flowers appear rounder; it is a very

### New Geranium MARS.

Mr. Eichholz, Waynesboro, Pa., the introducer, has the following to say of it:

"Mars is a seedling obtained from a lot of seeds bought of a New York firm by the late J. Nitterhouse. He thought a great deal of it, but his death made it impossible for him to put it on the market. We have given it a thorough trial in beds, in the open field and under glass. The flower is single, deep salmon center and distinct white edge, a most pleasing and new color combination in geraniums. As a market or home seller, we claim it to be a rival to such good sorts as Beauty of Poltevine, Paul Bruant, etc. It is perfectly sunproof, and produces a quantity of flowers—completely hiding the foliage which is of a deep green color with dark brown zone, making a grand contrast to the white and salmon of the flower. It will prove one of the finest border plants on account of its dwarfness, a great market geranium, a great Christmas and Easter plant when grown with a little care. It loves a cool temperature, that of a carnation house suits it best. It requires to be kept on dry side during Winter, like all geraniums, but avoid syringing when in bloom as the flowers are not waterproof. With a little extra attention the finest specimen plants can be grown."

### New Hardy Mammoth-Flowering HOLLYHOCKS.

These exquisitely beautiful hollyhocks are an entire break from the old-style formal flowering ones. The flowers of this new Mammoth-flowering type measure up to 5½ inches in diameter, or over 15 inches in circumference—but their great merits lie in the

wondrous delicacy of coloring and texture; the semi-double flowers are gracefully composed of fringed and crinkled petals, resembling rosettes of daintiest crushed satin. The colors are shell pink, rose and ruby red. The plants are hardy and large robust growers; the flowers are not closely huddled up, like other hollyhocks, but gracefully and carelessly placed among the large leafy branches which exactly suits the airy style of the flowers, showing them off to the best advantage; every bud, clear to the top, develops into

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 12, 1896.

PUBLISHED BY  
A. T. DELAMARE PTO. & PUB. CO. LTD.  
ROSE AND DUANE STS.  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1697.

## Publishers' Announcements.

Checks. Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**\$150,000 for Free Seeds.** A CIRCULAR regarding the annual seed distribution has been issued by Secretary Morton, in which he shows exactly what the free seed for the various sections of the country has cost, and makes a comparative statement with preceding years, showing that the plan which he has adopted gets nearly twice as much seed, and that of a better quality.

The total appropriation for seeds this year was \$130,000, with \$20,000 additional for testing, inspection, and other expenses of distribution. This \$130,000 bought 19,053,839 packets of vegetable seeds, 1,012,500 packets of flower seeds, and 292,925 quarts of field seed, such as corn, timothy, clover, etc. Each packet of vegetable seed cost less than six mills, each packet of flower seed less than eight mills, and each quart of field seed only a fraction over four cents. The total weight of the seed purchased is over 1,200,000 pounds. As put up for distribution it would require seventy-five mail cars to contain it. The cost to the Post Office Department of handling this amount of seed is estimated at \$100,000. The vegetable and field seed would plant 227,346 acres.

After describing the improved system of purchase, the circular concludes: "The only further improvement that can be commended with sincerity is the

total abolition of the promiscuous and gratuitous distribution of seed by governmental agencies."

Secretary of Agriculture. IT is announced that the Secretary-elect of Agriculture is Prof. James Wilson, director of the Iowa State Experiment Station at Ames. It is thus a guarantee that a man who has acquaintance with the demands of agriculturists and horticulturists has been chosen for this important post, and so should not fail to be of service in his new sphere.

Professor Wilson is a Scot, having been born in the parish of Girvan, Ayrshire, Scotland, in 1840, and was brought to America by his parents when a small boy. The first settlement of the family was in Connecticut, from which State they removed to Iowa, in the fifties.

For many years Mr. Wilson was a teacher in the country schools near old Buckingham and West Union. In the course of time he accumulated money enough to purchase a farm of 1,200 acres, which he now owns in Tama County, Iowa.

For several years Mr. Wilson has been Professor of Agriculture in the State school at Ames, and, in connection with his other duties, has edited a farm department for a newspaper.

Prof. Wilson is, we believe, more distinctly interested in stock raising; and we trust that a representative horticulturist will be selected as Assistant Secretary.

Station Bulletins. THAT the great majority of cultivators in the States do not yet appreciate the work that the Stations are doing, is shown by the fact that at the Geneva Station in New York State, for example, only 25,000 copies of the bulletins are needed to satisfy all demands, at the same time the lists of those calling for the bulletins are gradually increasing. Director Jordan, of Geneva, now proposes to issue specially edited "farmers' bulletins," which will give in popular language the gist of the full bulletins, and to leave it to everyone more particularly interested in the subject of the bulletin, to ask for a copy of the entire bulletin. This surely seems to be a needed and worthy innovation. It is safe to say that the great majority of those who now receive the bulletins, look at them and throw them aside unread. Text and language are usually far beyond the understanding of the ordinary man. To send these scientific bulletins broadcast to the number of 25,000 is a great waste of effort, paper and printing ink. Now write up a little story, readable, practical, interesting, all the time keeping within the understanding of the simplest farmer, and much good can be accomplished.

Other stations please copy!

Seed Trade.—The annual meeting of the American Seed Trade Association will be held at Washington, D. C., June 8, 9, and 10.

Hudson Valley Horticultural Society (to embrace 18 counties) is the title under which the fruit growers and others of Eastern N. Y. duly organized at Poughkeepsie on February 3. Officers are: President, James Wood, Mount Kisco; Vice-President, F. W. Taber, Poughkeepsie; Secretary, E. Van Alestyne, Kinderhook; Treasurer, B. Van Buren, Stockport; Corresponding Secretary, E. G. Fowler, Port Jervis. The first regular meeting is to be held in the Court House, Poughkeepsie, March 11 and 12.

Notwithstanding the severe cold, raging storms, and delayed trains, with all the inconveniences of travel which these things imply, the Western New York Fruit Growers came to their 42d annual meeting at Rochester in almost more than the usual numbers. The seating capacity of the big council chamber in the City Hall, even with the exhibition tables and aldermanic chairs of former years removed, was taxed to its utmost during the entire session. Notwithstanding the low prices which have characterized the past season's fruit sales, all over the State, and the often very unsatisfactory outcome of the season's business for the fruit grower, the old-time interest, enthusiasm, and push were still prevailing, and there was no sign of dejected or depressed spirits.

## Thank You!

I want to congratulate and thank you for your very able report of the Fruit Growers' meeting at Cornwall on the 25th ult. Yours is the best I have yet seen of the proceedings, and your editorial shows you have the horticulturists' interest at heart.—T. J. DWYER.

## READERS' NOTES AND COMMENTS

A Good Investment.—I am, in connection with my son, engaged in growing vegetables under glass. While our plant does not compare very favorably as regards size with some in the east, still we think for the time we have been engaged in the business we have a very fair beginning. We started in October, 1894, with one house, 20x8 feet, heated with a brick flue; we now have eight houses in all, one 10x80 feet, two 20x80 feet, four 20x150 feet, one 52x150 feet, all steam heated; we have two 80 horsepower boilers, set low enough to allow all the condensed steam to return to them by gravity (we only use one boiler at a time, the other being held in reserve in case of accident), wood is used for fuel; we grow lettuce, cucumbers, tomatoes, mushrooms, and rhubarb in them; we grow the Grand Rapids lettuce, as the head lettuce does not sell as well as this variety; this winter we are growing as an experiment some of Rawson's Forcing lettuce; at this writing it looks fine; we also keep 12 head of A. J. J. C. Jerseys; our barn is so arranged we save all the manure, both solid and liquid; the liquid manure runs to a large cistern and the solid is kept under cover, and worked over to thoroughly compost it; we have a large well, and all the houses have eave troughs connecting them with it; have two tanks of a combined capacity of 1200 barrels, which are at an elevation to give good pressure for irrigating purposes. This is my second year's subscription for AMERICAN GARDENING, and I have found it a very satisfactory investment.—A. F. HAAS, Wash.

Horticulture and the Schools.—Two recent issues of AMERICAN GARDENING contain very interesting articles on the Horticultural Society, and on Ornamental Gardening; the interest attaching to these subjects is now more important to the people of this city than most other branches of culture which present themselves. Education has long been regarded as a necessity for the people, and our common school system is a complete and thoroughly organized

department requiring large and constantly increasing expenditure. The division of natural science, however, scarcely finds a place in the curriculum of the public school. This is unfortunate, as it deprives us of many skilled workmen. Instruction in botany and chemistry and mineralogy might easily be introduced with success into the elementary departments of education, preceding grammar, geography, and languages. As exercise of memory and of the reasoning faculties natural science is an elementary form would be the basis of a practical education for the people. Science still struggles with prejudice. As a preliminary stage to the cultivation of taste in all such matters, the publication and introduction of improved text books on natural science is essential. The expansion of the city has been the result of modern methods of locomotion. With larger gardens and lawns comes an increased taste for elegant shrubbery; and the refinements of taste indoors and in the architecture of the home little brook a desert of waste outside. Horticultural taste, therefore, must be fostered by educational instruction in the elementary departments. And if the children love fruit, flowers, and music, their advance in culture under the guidance of religion will be a safety from anarchy and disorder.—**PRO BONO PUBLICO, Columbus, O.**

**Chrysanthemum Pink Ivory.**—I hope amateur gardeners will not be frightened from trying the beautiful Pink Ivory Chrysanthemum by the remarks of Myra V. Norys in a recent issue of your paper: "White Ivory has never done well with us. Can the pink beauty do any better than its antecedent?" I am myself an amateur on the smallest scale, but I found Pink Ivory as vigorous and as easy to grow and flower well as any. My one plant of it was grown entirely outdoors. By judicious pinching, I managed to get about 40 shoots. Leaving only the terminal bud on each, I had about the middle of October as vigorous, beautiful, and bushy a plant as one would wish, the flowers being of excellent size, considering how many there were on the bush. It ought by all means to be in every collection.—**L. C. L. JORDAN, N. J.**

**Over Sanguine.**—I notice that your correspondent on page 55 considers my statements "extravagant." He should remember that I said those results could only be obtained when all the conditions were right; intensive cultivation on very rich soil, with irrigation, and a good market. Last year, on a field of early celery, with close planting on rich soil with irrigation, my sales were at the rate of \$2000 per acre. This statement I can verify if any one be doubtful; but the celery was retailed at summer resorts and in nearby villages at from 40c. to 60c. per dozen. At the same time some celery on not very rich soil, and without irrigation, but little more than paid expenses.—**W. H. JENKINS.**

**Begonias and Sunshine.**—Myra V. Norys would like to hear from some one on this head (page 58). I would say that a temperature of about 55° to 60° is about right for flowering Begonias. A sunny position is all right during the winter months, but in spring it will be necessary to shade lightly. Ornamental leaved Begonias require partial shade at all times, and a higher temperature than flowering Begonias, with a moist atmosphere when growing; when partly at rest a dryer atmosphere and less water will suffice.—**R. SHORE, Ithaca, N. Y.**

**Peach Prospects.**—The annual prophecies as to the future crop are beginning to turn up. The outlook for New Jersey is said to be promising, so far.

## Western New York Fruit Growers in Council.

In recognition of the fact that the fruit exhibits of the Western New York Horticulture Society have always been excellent and remarkable, even in years of comparative fruit failure, the particular excellence of the show of fruit at this year's meeting hardly excites much comment. It was to be a matter of course, especially in a season like this, and concerns like the Geneva Experiment Station and the firm of Ellwanger & Barry among the competitors. Of the apples, each specimen seemed to represent the type in its highest perfection, and nothing finer could possibly be imagined. The State Station had on exhibit 114 varieties of apples, pears and quinces, while Ellwanger & Barry's exhibit included 150 varieties of apples, pears, grapes, quinces, etc. There were also some fine specimens of Japan persimmon. Some slight improvements in spraying machines and fixings were shown again by their respective manufacturers, although it seemed that the number of exhibitors in this branch was smaller than for years. An unusually interesting exhibit was the Bemis transplanting machine, which promises to be a material help to those who plant cabbages, tomatoes, strawberries and other vegetable and fruit plants in large quantities.

### President's Address.

President Barry referred with evident feeling of pride to the constant growth of the society, and urged the members to make further efforts in order to reach the five hundred mark. He then made a comparison of olden times with the present for the sake of showing the wonderful developments from the modest beginning made by our ancestors. "Could they have been with us the past autumn," he says, "and have seen the glorious harvest of apples, the trees everywhere bending beneath the heavy burden of beautiful fruit, and then taken into consideration the quantity as well as the quality, how proud and happy would they have been of their achievements, begun in so small and modest a way, but completed on such a magnificent scale."

### The Apple Crop of 1896.

Mr. Barry spoke of the apple crop of the past year as one of the most remarkable in the history of fruit culture in this country and of the results upon the markets as surprising and discouraging. "Abroad and at home the crop was practically lost. The outlook is certainly discouraging, but if we are willing to profit by the experience of the year and learn a lesson, it will be of advantage to us. It must be self-evident that hereafter greater care must be exercised in packing, and choicer fruit must be selected for both home and foreign markets. It will probably be many years before a similar crop will be produced. In the meantime growers should provide themselves with storage houses, where the fruit can be kept till the time arrives to market it advantageously. Among the many kinds which growers in this vicinity have had an opportunity to test, the Jonathan heads the list as a handsome, delicious and profitable variety; its size, shape, color, flavor and shipping qualities are all that can be desired, and it is somewhat strange that an apple possessing so many desirable characteristics should not have received greater attention. An orchard of this kind is probably the most beautiful that can be seen. The tree is naturally graceful, the branches being willowy, and the dark-red apples against the green foliage present a picture that does not fail to arrest the attention and excite the admiration of the most indifferent observer.

### General Recommendations.

Mr. Barry thinks that as the years pass by and our experience increases it becomes evident that a greater variety of products is necessary to success. The fruit grower should enlarge his sphere of work and cultivate fruits for the various seasons of the year, thus giving employment to a regular force of hands, who, on account of their proficiency, become indispensable on the fruit farm. Crops should be anticipated and markets provided just as the manufacturer seeks and secures sales for his goods. The grower who realizes this and

who is alert and industrious will very often, if not always, have a favorable showing to make at the end of the year. In this way only can large and satisfactory crops be grown and harvested. Fruit growing is a business which must be conducted on business principles in order to secure success. It will not do to leave everything to chance.

### In Memoriam.

The society has lost the following members by death during the year: (1) William Brown Smith of Syracuse, born March 2, 1815, died March 10, 1896. (2) Professor Albert Nelson Prentiss, Ithaca, born May 22, 1836, died Aug. 14, 1896. (3) John K. Beckwith of Brighton, died June 21, 1896. (4) Ernest Gustavus Lodeman of Ithaca, born May 3, 1867, in Switzerland. (5) Dr. Peter Collier, the former director of the New York Experiment Station.

### What We Accomplish.

Amid the gloom and disappointment of the year and the present situation, President Barry sees circumstances which should cause us to be happy and grateful. The fruits of our labors are spread throughout the land, bringing comfort and pleasure to many a household. The poor as well as the rich are enjoying them; the pear, the apple, the peach, the plum, the orange, and the grape are so beautiful and so good and furnish such pure, unadulterated and healthful food for millions of people that as the growers of such products we can justly be proud of our occupation. We have at least the great satisfaction of knowing that our productions are beneficial and not harmful in the least to mankind. With the return of prosperous times we shall be sharers in the general prosperity of the country, and if we give to our pursuit the attention it merits, there is no doubt but we shall reap rewards as great and as satisfactory as those gained in other occupations.

### Plant Diseases and Spraying.

Professor S. A. Beach of the Geneva Experiment Station, from data gathered from about 100 replies received in response to the inquiries which were sent to every member of the society, gave an account of the distribution of diseases during 1896. In a general way it appeared that plant diseases have been less prevalent and less serious than in some other years, and that therefore less improvement has been observed as a result of spraying. For detailed information on plant diseases and their treatment Professor Beach refers to Bulletins Nos. 98, 100, and 101 of the Geneva Station, and Nos. 113 and 114 of the Ithaca Station.

### Some Newer Ornamentals.

George H. Ellwanger, on behalf of the Committee on Ornamentals, mentioned the following of the newer introductions as of especial merit, viz.: Acer circinatum, Acer Heldreichii, Acer platanoides O. Stall, Acer platanoides undulatum, Acer pseudo-platanus Simon Louis Freres; Morus tartarica pendula (weeping Russian Mulberry), this is of rapid growth and effective from the start, few ornamentals are more deserving. Pyrus angustifolia, Deutzia parviflora; Eleagnus longipes, Caryopteris mastacanthis (blue spiraea), Spiraea Anthony Waterer. Among Roses he mentioned Marchioness of Londonderry, Earl of Dufferin, Margaret Dickson, Mrs. R. G. Sharman, Crawford, and especially Ohio; tea rose Mrs. Pierpont Morgan; polyantha rose, Pink Souper; Double White rugosa and Brunt's rugosa Belle Politienne.

### The State Experiment Station.

Director W. H. Jordan spoke of the work that the station is doing for the farmers and horticulturists of the State. We now have a vocabulary entirely unintelligible to the growers of an earlier period, and use freely such terms as nitrogen, potash, phosphoric acid, carbohydrates. The Experiment Stations also seem to have developed into courts of arbitration for questions submitted to them by editors and farmers. The first Experiment Station, that of Connecticut, was established in 1875. Now we have fifty-five stations with 600 workers. The station is not an institution to provide farmers with arbitrary rules for carrying on their business. The question, How can I make more money? is not for the station

to solve. The legitimate work for the station is to discover the facts and principles which underlie agricultural operations, and which every farmer must handle in his own way to make a success.

#### The Fertilizer Trade.

Director Jordan deplors the condition of the fertilizer trade. Manufacturers take three different substances, mix them in different ways, and sell them to the farmer under 1,126 different trade names. This is a tangle that should be straightened out.

#### Desirable Station Work.

The stations might do more in two ways, says Professor Jordan. They should have a closer grip on the seeds sold in the State, which are so often adulterated and foul with weed seeds.

#### Recent Investigations.

In recent years the cucumber or "pickle" industry on Long Island has been seriously threatened by the cucumber blight. Experiments made by the station have shown that the disease can be controlled by persistent spraying. Unsprayed plots gave only one picking, while sprayed plots held out to the end of the season. A bacterial disease of cabbage has been discovered as a new enemy.

#### Variety Tests.

Professor Jordan differs from the critics who have held that variety tests are not proper work for the stations to undertake. He thinks that the advantages of such work to all concerned are too great to be neglected. People come to the station to get information on varieties, and the station should be able to furnish it.

#### Fruit and Vegetables as Diet.

Professor W. R. Lazenby combats the idea that fruits, etc., are medicines. The normally healthy body, he says, craves what is wholesome not what is medicinal. So it is wrong to think we must eat fruit when we do not feel well. Fruits are not perfect foods; in order to get all the nutrients required by a healthy person from strawberries or tomatoes, etc., a man must eat these fruits or vegetables by the bushel. The qualities which make fruits and vegetables useful are acids and flavor. The acids are cooling, allay feverishness and tend to keep the organs of nutrition, especially the liver, in good working order. The acids of sound, mature fruit are also in a measure germicidal, and therefore wholesome.

#### Apple Varieties.

In response to the question: What variety is best for the grower, Mr. J. S. Woodward stated that he had made most money from the Maiden Blush. On heavy clay soil the trees are healthy and bear uniformly, while the apple is always wanted at good prices; it keeps well. Oldenburg is profitable, but must be marketed when ready. Baldwin is a good apple. Hubbardston's Nonsuch is too early. Professor Lazenby mentioned the Lady apple as bringing big prices; it is not a heavy bearer. Mr. S. D. Willard speaks of Mackintosh Red as a good apple; it is beautiful, and the tree hardy; needs spraying. Longfield needs careful handling, being tender, but sells at high prices; its foliage is perfectly healthy, saving the trouble of spraying. Mr. Willard would select this as one of the varieties, picking and handling very carefully. Alexander drops badly from tree. Peck's Pleasant is a good apple, but hardly of the right style for market. Princess Louise was mentioned as a Canadian apple of the Fameuse type, beautiful and ripening in early winter.

### Ideas by Boston Market Gardeners.

**Dropping Unprofitable Crops. Women as Field Help. Taxation Farm Land. Management of Celery.**

At the recent meeting of the Boston Market Gardeners' Association, J. C. Stone, of Watertown, gave an interesting address on making the farm pay, in which he advocated cutting down expenses by dropping crops which return only the cost of production and substituting strawberries and hay in place of them. He said that 1895 was the fourth year that the business

had not returned a profit, and that if gardeners dropped some crops they would have money at the end of the year. He recommended each one present to set an acre of strawberries and to grow hay enough for his own use. One acre of strawberries in Belmont produced \$1000 worth of fruit. He could see no chance to make money on pears, apples, or currants, and advised reducing the acreage of onions and beets. The returns from the 1896 crop of celery were unsatisfactory, as the crop did not keep well, and has had to be rushed into market regardless of price.

In speaking of help, he said that one man was required to every two acres; that the price of labor had not decreased with the price of produce; that we were paying too high wages, and had got to let old men go and put younger and cheaper men and even women in their places. He cited an instance wherein a ten-acre field of beets last year all the labor except loading and unloading the beets was done by women who received 83c. per day. Referring to the manure question, he said that it cost too much at present. Market gardeners must have it, but they were foolish to pay for it. It has got to be removed from the stables, and if the members will support each other they can get it for nothing. He mentioned that irrigation was necessary to insure success, and said that the claim that when a market gardener was getting a living that he was doing well, and could depend upon the increase in the value of his land for his profits was N. G., as three-fourths of the market gardens are not worth more to-day than they were twenty years ago. He emphasized the fact that farmers should take an active interest and part in town affairs, and labor too.

Keep down taxes by limiting appropriations and by having it taxed on its agricultural value, which rarely exceeds \$300 per acre, rather than on its prospective house-lot value. He referred to the sewer question and favored paying for them by general taxation in a series of years, saying that it was only fair for those that come after us and receive benefit from the sewers to pay their share of the cost of construction.

B. P. Ware, of Marblehead, spoke on taxation, saying that land could be rented in Marblehead for the amount of taxes, and that ownership is no advantage except from sentiment. The average rate in Massachusetts is \$15 per 1000, but if all personal property eligible to taxation was taxed, the rate would be reduced to \$7.50 per 1000. Those who evade taxation do not consider themselves thieves and robbers, but what else are they? The farmer's property is all in sight, and all of it is taxed. Land should not be taxed at its prospective house-lot value. The agricultural value of his land is from \$100 to \$300, and it is taxed at \$12 per acre. This valuation and the high rate in Marblehead eat up the profits of the farm.

Captain Strange stated that it is cheaper and better for some farmers to have part of the cost of sewers assessed on abutters, than to have it all paid by general taxation. Location decides the question.

Mr. Sullivan, of Revere, said that if he wanted to punish a man he would put him in charge of a market garden with Italian laborers. He believes in keeping tried and trustworthy men, and hopes that the new tariff will make it possible to maintain the wages of the past. He agreed with Mr. Stone that farmers should take an active part in town affairs.

Mr. Derby believed that those vegetables that sell high one year, go low the next, and vice versa, and said that the Market Gardeners' Association, by disseminating information, had increased competition.

President Rawson stated that he had written Congressman Dingley in behalf of the association requesting a restoration of duties upon farm products equal to or above those which existed in the McKinley bill. His action was commended, and Mr. Sullivan said that cabbage should be included in the list as large quantities of Danish cabbage come into New York, and will soon make their appearance in Boston. Secretary J. H. Crosby, referring to the recommendation that farmers take an active part in town affairs, said that in most towns the farmers were a hopeless minority, and that the only effective way for them to work was to exert their moral influence and mould public opinion.—New England Farmer.

## The Classic Series OF MUSIC BOOKS

THE EMBODIMENT OF THE BEST IN MUSICAL ART . .

THE Classic Series of music books stand pre-eminently first among the music books of the world. They contain the very highest and finest grade of music ever written. All the best works of the great masters of music will be found in these volumes. Every music lover who desires to have the best examples of musical composition should order one or more of these volumes.

- Classic Vocal Gems for Soprano, 31 songs.
- Classic Vocal Gems for Alto, 33 songs.
- Classic Vocal Gems for Tenor, 30 songs.
- Classic Vocal Gems for Bass, 25 songs.
- Song Classics for Low Voice, 40 songs.
- Classic Tenor Songs, 36 songs.
- Classic Baritone or Bass Songs, 33 songs.
- Piano Classics, Vol. 1, 44 pianoforte pieces.
- Piano Classics, Vol. 2, 31 pianoforte pieces.
- Classical Pianist, 42 pianoforte pieces.
- Young People's Classics, No. 1, 51 easy pianoforte pieces.
- Young People's Classics, No. 2, 48 easy pianoforte pieces.
- Classic Four-Hand Collection, 19 pianoforte duets.
- Selected Classics, 32 pianoforte pieces.

For further particulars, send for descriptive circulars, giving list of contents, etc., free . . . . .

EACH book is printed in the best style of the music-printer's art. The modern engraved transfer process is employed; only the finest quality of paper is used; and the binding is artistic as well as substantial. In make-up as well as quality of contents, the Classic Series stand alone at the top.

Price, Each Volume, Postpaid, Paper, \$1.00. Boards, \$1.25. Cloth, Gift, \$2.00.

Any piece or book of music published at home or abroad can be secured from us at shortest notice.

## With a Produce Car.

How many readers of American Gardening know what a product car is? Probably not many are aware that it is a railroad car fitted out for the traveling exhibition of the agricultural and other products of a State, or some railroad having a land grant to dispose of and which takes this method of advertising its land and the possibilities of its production.

There are several such cars on the road advertising Florida and California, and the particular one here described is sent out by the Northern Pacific Railway with a full exhibit of the agricultural and mining products of the several States traversed by the line of road.

The history of this particular car will bring it dimly before the mind of many a reader when it is known that it is one of two cars specially constructed for the purpose and which were exhibited at the World's Fair at Chicago. After the Fair it was fitted out to advertise the products of the Northwest.

It is, perhaps, one of the most expensive methods of advertising possible. In the first place, the car and its contents cost about \$20,000, and the expense of running it, with its manager and assistants, together with the tons of literature put out, place it beyond anything but a railroad company to operate. The car is specially built for show purposes, and is as gaudy on its exterior as a circus van, while all the resources of the most skilful artisans are called on in its interior decoration to show the native woods in their most effective combinations. When all is ready for fitting up, the services of a collector are called on, and every plant of an economic character, minerals, specimens of the taxidermist's skill, preserved fruits and all that sort of thing, together with photographs of scenery, are artistically displayed in the interior. Before a wheel turns a good-sized fortune is expended. Then a route involving a hundred or more towns having been all arranged, the car is ready. The towns are all billed in advance and every means taken to secure attendance. Admission is free.

When the car pulls into a town and is placed on its siding it is at once swarmed with people, who pass to the right, around and around, asking all sorts of questions and getting the advertising material given out.

People who see these fruits and vegetables almost invariably imagine that the largest specimens are selected and that their method of display in glass magnifies their size. This is only partially true, if at all. It is a fact that some of the largest fruits and vegetables in the world grow on the Pacific coast.

What will interest our readers as much as anything else is the method of preparing fruit for exhibition. There are twelve different chemical preparations for as many different fruits, and with the right one a plum, for instance, can be preserved indefinitely in glass in such a way as to leave even the bloom intact. But it is not good to eat. There are few, if any, fruits that can be preserved in alcohol, as it extracts the color and shrivels the specimens. Cooking, or heat of any degree, ruins them. Without giving away any trade secrets, it may be said that almost every fruit or vegetable can be preserved fairly well for a good length of time if simply put in

glass and covered with clear, cold, soft water.

The attendance at a product car often mounts as high as 5,000 in a day, many coming miles to see it, and it is worth while, too, as it gives a fair showing, and a free one, of what can be done in the great West.

HOWARD MILLER.

## Orchards in Nebraska.

At the recent meeting of the State Horticultural Society, the following, among other topics, were presented: In "Orcharding in Western Nebraska," J. A. Hogg, of Shelton, told of his early experience with pruning, which he soon found was not a success if done heavily. He had found that one-year-old trees headed from four to six inches from the ground were the most likely to grow. He gave five reasons: Branching out protects the trunk from injury, it protects from sun scald, it keeps the ground moist and prevents evaporation, wind does not injure the fruit so readily, and the fruit is easier to pick. He used Russian Mulberry and Honey Locust for wind-break. For success with grapes, sub-irrigation is necessary.

C. A. Barnard, of Table Rock, discussed "Methods and Varieties of Apples for Commercial Orcharding." He said: "A man must lay aside all preferences. Soil should be prepared in the fall, and trees of two or three years planted in the spring. There should be some summer and some early fall apples, and not run all to winter varieties as many do. Early Harvest and Red Astrachan are the best for his locality for early varieties. Next come Fall Winesap, Maiden Blush, for winter use Winter Winesap, Jonathan, Junetia and Missouri Pippin."

In "Profitable Orcharding," by G. A. Marshall, of Arlington, it was held that Nebraska has a good climate for profitable orcharding. Early Harvest and Maiden Blush apples, which succeeded well in Southeastern Nebraska, will do well north of the Platte. Wallbridge and Iowa Blush take their place. The Whitney is good. Benova and Red June do nothing north of the Platte. He opposed giving local names to varieties, and this point was taken up in the following discussion.

J. M. Russell, of Wymore, talked on "The Peach—Our Experience in 1896 With It." The crop was very large, prices lower, but quality not so good as some other years. He heads the trees to the ground and does not prune.

**Quenched Fire With Wine.**—The dwelling of John Hauser, who owns large vineyards near Egg Harbor City, was on fire Jan. 25. There was no water available to fight the flames, but the firemen, to save the building, had recourse to the big wine vats, pumping wine upon the flames until the fire was out. The loss on the house is about \$2,000, but the loss in wine was considerably greater.

**Prevention of Insects.**—A convention is called for 10 A. M. on March 5 next, at the Ebbitt House, Washington, D. C., to consider the best measures to be taken in securing such national legislation and supplementary uniform State legislation as may be necessary to prevent the dissemination of noxious insects and fungi, and prevent their introduction into the United States from other countries.

**Popularity of Orchids.**—As proof of the growing popularity of Orchids this season, these figures concerning a recent dinner given by the Bradley-Martins in New York City are of interest: A large table set for 32 covers was decorated with 500 Cattleya blooms, 220 Dendrobium blooms, and 200 spikes of Lælia anceps; these were laid on a foundation of Adiantum Farleyense. In the center was a raised mound of Cattleyas, working down from which was a bed of Farleyense covered with Cattleya blooms. Corner mounds were made with Dendrobiums nobile and Wardenianum, with sprays of Lælia anceps gracefully laid around. Another feature of the table was the designs of the same flowers worked out on each corner.

Quackery is always discovering remedies which will act upon the germs of disease directly and kill them. But no discovery has ever yet been approved by doctors which will cure consumption that way. Germs can only be killed by making the body strong enough to overcome them, and the early use of such a remedy as Scott's Emulsion is one of the helps. In the daily warfare man keeps up, he wins best, who is provided with the needed strength, such as Scott's Emulsion supplies.

## The Window Garden.

Two Classes of Plants. Formula for Liquid Manure. Heat and Moisture.

Generally, only two classes of plants are grown; those requiring a temperature of from 50° to 60° Fahr., at night, with a rise of 10° to 15° during the day, and those which require a temperature of about 15° less. In the first class are included Geraniums (with the exception of Pelargoniums, often called Martha Washington Geraniums), Roses, Fuchsias, Ferns, Palms, Begonias, etc., and in the latter, Carnations, Hyacinths, Cyclamens, Cinerarias, Geraniums (Pelargoniums), Azaleas, Primroses, etc.

Plants grown in a dry, heated atmosphere do not thrive as well as those grown in a moist one, and are more subject to the attacks of red spider and aphids (lice). The air may be rendered moister by keeping an open vessel of water in the room. Red spider may be kept in check by frequently spraying the plants with water, while the aphids can usually be deterred from attacking the plants by dusting them occasionally with tobacco dust. If they should prove troublesome, they may be killed by spraying the plants with a liquid tobacco solution. A tobacco extract is sold which is a valuable insecticide.

A potting soil meeting the needs of most window plants is found in a mixture of two parts loam, and one part each of leaf mold, manure, and sand.

It is often necessary during the winter months to supply some liquid stimulants to the plants, in order, in the case of flowering

FIG. 33—VIOLET PRINCESS OF WALES.

(See page 86.)

plants, to increase the number and size of the flowers, and in that of foliage plants to give a darker and more luxuriant growth. These artificial stimulants may be applied in the form of manufactured plant foods or what is infinitely more satisfactory, if not quite as pleasant, in the form of liquid manure made from a mixture of cow and sheep manures, in the proportion of about four to one, with a small amount of ashes to furnish an excess of potash. These ingredients should be steeped in a barrel or tub of water for several days before using. Care should be exercised in the use of artificial stimulants of any kind, as they will injure the plants if applied too strong, or in too liberal amounts. Liquid manure made according to the method described, should be diluted until it resembles the color of weak tea. Plants should not at first be watered oftener than once a fortnight with it, gradually increasing in frequency until once or twice a week is reached.—Bulletin 41, Purdue University.

N. J. Cranberry Growers Met on January 26 at Trenton. J. H. Brakeley, of Bordentown, presided at the meeting. T. I. Budd, of Pemberton, made the opening address. The crop last year was unsatisfactory. Cape Cod had a full crop, but New Jersey had only half a crop. The growers do not take a cheerful view of the situation. The crop of 1895 was 400,000 in New England,

150,000 in New Jersey, and 30,000 in the Western States, making a total of 580,000 bushels against 630,000 in 1895. The officers elected are: President, Dr. J. H. Brakeley, Bordentown; first vice-president, the Rev. E. H. Darrell, Woodbury; second vice-president, C. L. Hulman, Lakewood; secretary, A. J. Rider, Trenton.

**Hemp and Jute.**—The demand during the past two years for information regarding the best practices for the successful growth of hemp and jute has caused the Department of Agriculture to issue "A Report on the Culture of Hemp and Jute in the United States, with statements concerning the practice employed in foreign countries, the preparation of the fiber for market, and remarks on the machine question," by Chas. Richards Dodge, special agent. Formerly the hemp-growing industry of this country was of considerable importance, large areas were devoted to the cultivation of the plant, and as much as 75,000 tons of the fiber were produced in one year, but last year hardly more than 5,000 tons were reported for the whole country. The bulletin treats of the history of hemp and the range of its culture, statistics, and production in the United States, soil selection, fertility, and preparation, the necessity for good seed, harvesting, and retting the crop, extracting the fiber, recent experiments in California and the South, and the uses to which the fiber is put. It is considered that the extension of the already established culture of hemp might supply a substitute for the jute in many of the coarse jute manufactures now produced in this country, and thus re-establish one of the decreasing products of American farms. The second part of this bulletin gives a history of the jute industry, and discusses the different kinds of fiber and its uses, culture, etc.

Is some branch of your farm work going wrong? Some hen or animal not doing well? Some tree or plant not producing well? Write the whole trouble to *The Rural New Yorker*, and you will get the advice and experience of the best authorities in the country on the matter. It costs only \$1 a year to have it come to you every week. We can send it and AMERICAN GARDENING, both one year for \$1.80, and your money back for *The Rural* in three months, if you want it.

### Business Cards.

Cards will be inserted under this heading at two CENTS PER WORD each insertion, payable in advance; the address to be counted part of the advertisement.

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

Grow the Best grade of fruits.

Feed the Soil and it will feed you.

An Even Temperature for the house plants.

Bouncer Strawberry seems not to be up to the claims made for it.

Peaches.—We planted more Early Crawford and Foster peaches last fall than any other variety.

Profits in Poultry depend more on the care it receives than most people think.

Woodruff Red Grape does not prove to be equal to the claims made for it.

The Land is Exhausted by frequent cropping. Let us then refill it with plant food by frequent manuring.

Quality Does Not always govern the price in small fruit as much as size and appearance.

All Purpose Fowl.—A cross of the Brown Leghorn and Wyandotte or the Plymouth Rock, makes a first-class "all purpose" fowl.

A New Orchard had better be planted out, to take the place of that old one that is on the decline.

New Strawberry.—Is your shortly to be introduced novelty free from the rust? If not, don't impose it on the public—too many new ones on that order now.

Gardening, skilfully managed, is one of the most independent and agreeable occupations.

Shall We Plan to have a fresh bouquet of flowers in center of the table during each meal next summer?

The More I See of setting rows of strawberry plants between rows of raspberry plants, the less I am in favor of it. Of course, it means economy in ground but not in labor.

Replanting.—I have seen farmers set young trees in an old orchard where trees had died out, and have noticed that they were mostly a failure.

The Most Beautiful Peach Orchard I ever saw was one in Michigan. When the proprietor set out the trees, he cut off all limbs, and cut the tops back to within twelve to eighteen inches from the ground, leaving a mere stub with three to five good buds near the top. The orchard is now in full growth, and during picking season the peaches can mostly be picked from a chair or low step-ladder.

Parker Earle is a fine strawberry on rich, heavy loam with a clayish subsoil, but on sandy land I find it will not mature one-half of the berries it sets.

Early in the Spring when the black raspberries are being set, it is good to put a large fork full of rotted manure in the row between each hill, and if poor sandy land, two forkfuls will be better. A vigorous healthy growth the first year will be the result, if well cultivated and hoed.

Study and Plan understandingly and carefully; try to avoid the mistakes of years past; step ahead cheerfully with a firm determination to improve, and there will be better times ahead for you.

Cracked Pears.—If you have a pear tree that bears cracked fruit scatter wood ashes all over the surface of the ground under the tree out about two feet beyond the outer limbs, then at fruiting time note the result. If the ashes can be stirred two or three inches into the soil, all the better.

## Successful

growers of fruits, berries, and all kinds of vegetables, know that the largest yields and best quality are produced by the liberal use of fertilizers containing at least 10% of

## Actual Potash.

Without the liberal use of Potash on sandy soils, it is impossible to grow fruits, berries and vegetables of a quality that will command the best prices.

All about Potash—the results of its use by actual experiment on the best farms in the United States—is told in a little book which we publish and will gladly mail free to any farmer in America who will write for it.

3 NEW AND POPULAR FLOWERS.

New Star Petunia. An exquisite variety for garden or pot culture, each flower having distinct white star-like stripes on rich purple-red ground. The flowers, about 2 1/2 inches across, almost hide the plant from view for months.

Double Calliopsis. Handsome double variety. Flowers golden yellow color, white-margined.

Sweet Scented Pansies. Have the perfume spots of the Violet; the beauty of the Pansy. One pack each of these New and Popular Flower Seeds sent by mail, postage prepaid, and three months' subscription to the

AGRICULTURAL EPITOMIST. ALL FOR 10 CTS

The Agricultural Epitomist now goes regularly into the homes of over 1,000,000 Practical, Prosperous and Progressive Farmers of the United States and Canada, and is said by them to be the most Practical, Timely and Interesting Farm, Garden and Household Paper published. It treats intelligently upon General Farming and Stock Raising; tells how to make the Garden pay; how to raise Poultry; treats on Floriculture; and its Household Department, known as "Chatter Corner," is alone worth a year's subscription to any live household. This offer to furnish a packet of each of the above described new and popular flower seeds and three months' subscription to the Agricultural Epitomist, all for 10 cents, is made for the purpose of introducing the Epitomist into new homes, believing that where it is read for three months, it will be found so valuable and interesting as to secure for us in nearly every case a yearly subscription, the regular price of which is 35 cents. The money we will receive from this offer will not be sufficient to more than pay for the advertising, to say nothing of the Flower Seeds and three months' subscription. Send 10 cents in silver or stamps, upon receipt of which the Flower Seeds and Epitomist will be promptly forwarded. Address: EPITOMIST PUBLISHING CO., Indianapolis, Ind.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### Begonia Semperflorens.

Begonia lovers who are distraught because of repeated failures with these favorite plants, would do well to turn their attention to the Semperflorens type. Semperflorens gigantea rosea will give satisfaction where no other type can be well grown. It is so sturdy and free, and so handsome withal, that to grow it once is to have it always on the list. Its fine crimson buds are replaced in the new Liberian Begonia, with those of a deep pink. Otherwise, the plants seem much the same. They do not, of course, take the place of the Rex varieties, but under certain conditions, may give more satisfaction than the latter.

### A Remarkable White Carnation.

People who love Carnations, and who like to keep up with the times, should have open eyes for the new white sort known as Flora Hill. Last spring, when shown at the meeting of the American Carnation Society in New York City—both plant and cut flowers—it created quite a buzz of excitement among the growers. It was certificated by the National Society, and has just received a special certificate from the Cincinnati Florists' Society. A rather prominent expert on Carnations states, without qualification of any sort, that, in his opinion, Flora Hill has all the good qualities that a Carnation can possibly have. The National Society gave it 86 points, if my memory is correct, out of a possible 100. It must mean

FIG. 34.—FRUIT LIFTING BOX.

a very stiff standard, when 86 points is as near as Carnation men expect to get to it. But the immense number of new seedlings necessitates strictness. This new beauty can now be had at retail.

### A Lilac-red Saintpaulia.

The typical Saintpaulia in dull blue is barely becoming known in this country to the people at large, but an improvement is already offered. The new style is known as Saintpaulia ionantha rubra. It is said to come true from seed, and as the type is long-blooming, the two are likely to be of much interest, and it may be hoped, of much pleasure and profit to window gardeners.

### Thriving Plants and Decorative Effect.

If there is difficulty in effectively arranging a general miscellaneous collection, what must be the trials of the experimenter? A larger range of sorts, and the necessity of giving each plant the conditions best suited to it in order to fairness, if nothing else—make the work far more difficult. Either the effort toward effect must be given up in favor of results plantward and blossomward, or else there must be a most judicious giving up of space to some few decorative things which may be considered from the standpoint of the room rather than of the sunshine and the plant's needs. Dracenas, Aspidistras, "Nile Lilies" and Palms may help much in this direction. The Rubber plant is also good, if young; older, it would take too much room from other things. Generally speaking, she who gives full con-

## A Little Child With a Little Cold.

That's all!  
What of it?

Little colds when neglected grow to large diseases and

**Ayer's Cherry Pectoral**  
**CURES COLDS.**

sideration to decorative effect, will find the plants soon failing, to be replaced by purchases of others. A supply window in an unfrequented room is a good thing to rely on.

### A Talk About Ornithogalum Arabicum.

"Honestly, now, does any one succeed in blooming Ornithogalum Arabicum? I've had it four different seasons, and it never has bloomed for me yet. One winter the bulb stood in the pot the whole season making never a root, and no foliage. The bulb was large, and notwithstanding this behavior was sound, and apparently all right in the spring. The difficulty doubtless lay, as is usually the case, in the fact that the bulbs were not as well ripened as they should be. What was the treatment they received from you?" "The same as the Hyacinths, with which I have no trouble; rather cool, always." "Perhaps it would be well to try more heat." "Would you try again this season?" "I think not; the bulbs now obtainable are culls and not in good condition."

## To Handle Fruit Without Bruising.

When fruit is sorted over in the winter, it must often be turned out of baskets or boxes, or picked out slowly by hand—a laborious process. The cut (fig. 34) shows a box—to hold a bushel or so—that is divided through the middle, hinged at the top on either side, and hooked at the bottom to keep the sides together. The box can be filled by hand at one bin, carried to another, the hook loosened, and the sides gently raised, when the apples will gently settle into place in the bin, many of them being moved scarcely at all. The bottom of the box can be covered with cloth to minimize risk of bruising. The same kind of a box will be found very useful also in the fall when securing the fruit crop.

Fruit Growers are learning the value of elevation and a northern exposure if they are to succeed well with certain lines of fruit. The elevation is a means of giving good air drainage, and is thus quite effective against injury to fruit buds by late frosts. There is also little danger from late growth to be injured by the cold of winter. The northern slope is an effective precaution against early bursting flower buds to be injured by late frosts. Fruit growing is one of the occupations wherein men are apt to make costly mistakes at the very outset unless they go about their work understandingly.—Nebraska Farmer.

## WHOLESALE MARKET REPORT

New York.

The cut flower trade still remains quite brisk in many lines, fully equal to that of last week. High grade roses are in demand and are realizing fair prices.

Cattleyas are now rivaling American Beauty roses in popular favor, at least with the most fashionable set, or for very expensive dinner decorations; possibly there is an average of 1,500 blooms per week used in this city. The highest wholesale price is \$50 per 100.

Sales of hothouse vegetables have improved considerably over previous reports; the freeze in Southern section has already had its effect, which possibly will be more felt in the near future.

Very heavy losses are reported from Florida owing to the cold snap. Accumulated stocks of many kinds are in our market, and there is a promise of a full clearance; then a boom in nearby stock may be anticipated.

Radishes still continue an excellent selling article. The high prices and ready sales have tempted growers to work in inferior stock and also to bunch slim; this is poor policy. Prices range from \$2 and \$2.50 per 100 bunches for moderate and mixed stock to \$3.50 and \$4 per 100 bunches for superior.

Lettuce has stiffened a little, and is quoted at 75 cents per dozen for strictly fancy, with inferior grades at from 50 cents to \$1 per barrel.

Tomatoes are poor generally; 35 cents is the top price for the few that are really good.

Cucumbers are still desirable stock for the grower; prices rule for seconds \$1 to \$1.50 per dozen; No. 1 making \$2 and \$2.50 per dozen. To obtain these figures grading needs to be done very closely indeed, evenness of stock being demanded.

Mushrooms remain practically as stated in previous report; a few very fancy have realized 50 cents per pound, but quantities still change hands at about 15 to 20 cents per pound.

Asparagus is seen here and there, but prices and demand are so irregular that no figures can be quoted.

Hothouse strawberries are in good demand, but prices are on the decline, \$3.75 per quart being about the figure for best; No. 2 at \$1.50 per cup. Florida berries are meeting with a wretched market; unless very fancy these make 35 to 50 cents per quart. Quantities are being peddled on the streets.

## Apples.

The arrivals of apples continue moderate. Recent sustained improvement in the foreign market has stimulated a larger export movement, and given considerable support to the recent improvement here. The market is quite firm. Possibly exceptionally fancy qualities might be placed above our top figures. The general offerings, however, are mostly of medium quality, and more sales of Baldwin and Greening are at about \$1.25 than higher.

Greening & Baldwin, ordinary, per bbl	75@1 00

## Vegetables.

Eastern onions are generally well sustained when of fine quality; Orange County stock about steady; State and western yellows are meeting a moderate demand at unchanged prices. Norfolk kale and spinach are nominally unchanged in absence of fresh arrivals. There are no fresh offerings of beans and the few lots carried over are mostly damaged by frost and of uncertain value. A letter from a well posted man at Tampa, Florida, dated January 30th, says that the vegetable crops in the Manatee River section and all south of Tampa are not materially injured by the recent frost, and that the crops in those sections are large and include nearly all kinds. At Winterhaven and all points north he reported more or less serious damage, with many crops entirely frozen and killed. He says that strawberries are set back at least three weeks.

## Philadelphia.

Owing to the cold snap extending well down South the market has presented quite a different appearance this past week; prices have become much firmer, but still not much trade is being done, as the extremely cold weather here prevents dealers from displaying stock, and all buyers purchase with extreme caution.

Apples have gone up somewhat and may raise still more unless more stock arrives. Many apples were frozen during the past week,

Mention American Gardening when you write.

as were also a great many potatoes.

Mushrooms have sold better these past few days, the present price is 20c. to 25c.

Tomatoes are arriving in larger quantities and of much better color; now selling at 25c. per lb.

There seems to be very little stock arriving in this market from local growers. Usually at this season there is a quantity of lettuce coming in, but this season hothouse lettuce is very scarce. Nothing has arrived from the South for several days and all stock that came last week is being held for higher prices. Lettuce is selling at \$2.00 to \$2.50 per basket. Spinach is being asked for, but little can be obtained.

Apples, Spitzburg, fancy, per bbl.	1 50@2 00
—Baldwin, fancy	1 35@1 60
—Baldwin, No. 2	75@1 00
—Greenings, N. Y., fancy	75@1 00

## Vegetables.

Beets, Florida, per 100 bunches	5 00@8 00
Beans, Florida, wax, per crate	3 00@3 50
Brussels Sprouts, per qt.	6@ 10
Cucumbers, Florida, per crate	2 00@2 25
Cabbages, new, per crate	2 50@3 00
Cauliflowers, per basket	2 25@2 50
Celery, extra, per doz, stalks	40@ 60
—Fair to good	25@ 40
Egg Plants, Fla., per 1/4 box, scarce	1 00@1 75
Kale, Norfolk, per bbl.	50@ 75
Lettuce, Florida, per 1/2 basket	2 00@2 50
—No. 2, per 1/2 basket	1 00@1 75

## Onions.

Nearly all the stock now coming in is from New York State and Ohio. Prices remain low and most commission houses do not care to carry many barrels on hand.

Eastern white, per bbl.	3 50@5 50
—Red, per bbl	3 00@4 25
—Yellow	2 50@3 50
Ohio, red	2 25@3 00
—White	2 50@4 00

Peas.—No good stock in the market.  
String Beans, green Fla., per crate. 2 00@3 00  
Spinach, Norfolk, scarce, per bbl. 4 00@ —

All Southern produce now selling has been on hand three or four days and does not look very tempting. The severe weather in the South has somewhat disgusted the commission men, many of whom have been supplying the growers with seed; one house alone sent down seed last fall amounting to \$2,000, and it now looks as though no returns will come.

Extra mixtures: Ingleside Hybrids, Dr. Van Fleet's choice collection, Burbank's California Select, Mt. Vernon Hybrids, Groff's Hybridized Seed and Seedlings. Cannas, Italia, Austria, and best standards. New Hybrid Clivias. Cannas Seed. H. H. Groff, Simcoe, Ontario, Canada.

### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

**GARDENER and Florist**, 30 years of age, single, German, 15 years' experience, wishes to take charge of gentleman's place, first-class references. Address L. D., care American Gardening.

**YOUNG** unmarried man wants situation to assist in plain gardening and greenhouse; have quite a good experience in violet growing; good references. John Lomus, Box 106, care of Elbert C. Howes, Brewster, N. Y.

**DANE**, 32, with 18 years experience in Denmark, Germany, Bohemia, Austria, Switzerland and United States; Ericas, cut flowers and Palms specialty; like landscape gardener; wants position. Address or call, Nelson, care of Mr. Thomas, 242 East One Hundred and Fourth St., New York City.

**SITUATION** wanted as assistant and gardener on large private place, by young married German. Would prefer place where opportunity is offered to get thoroughly acquainted with the culture of orchids and grapes under glass; good references given. Address H. M., Post Office Box 114, Edwardsville, Ill.

**WANTED**—A situation by a thorough practical gardener with 40 years practical experience in all branches, including palms, roses and greenhouse plants for conservatory, decorating and bedding out; fruit, vegetable and flower gardens and pleasure grounds; the building of greenhouses; hot water and steam heating, road making, grading and leveling and drainage on private or public grounds; can take the sole charge of a large estate or other works; first-class certificates; married; no family; state wages offered to L. E., Lakeside, Ill.

## PRIVATE GARDENERS.

We solicit for publication under this heading notices on the work being done by private gardeners, changes in appointment, and all matters of interest to horticulturists generally.

### Appointment.

Samuel Henshaw, landscape gardener of West New Brighton, Staten Island, N. Y., has been appointed head gardener to the New York Botanical Garden. The long experience and well known skill of Mr. Henshaw peculiarly fit him for the post.

Alexander McKenzie, who for the last three years has had charge of the greenhouse of W. S. Gurnee, at Blauvelt, N. Y., has bought three Rose and two Violet houses, a hundred feet each, in Nyack, N. Y., and is to start in the florist's business after March 1.

## The Professional Gardeners' Mission in Horticulture.\*

It is a few years since I was daily engaged in the working department of our business, and, therefore, did not feel justified in choosing as a theme any line of active operation. You will have before you from time to time, I am informed, men who are qualified to speak on these lines, and you will have a variety of subjects. Being in daily contact with men representing all branches of the profession, also with the classes who may properly be called the patrons of horticulture, people who own broad acres and employ gardeners; in daily contact, too, with the amateur gardener who cultivates his or her own little plot of ground, whose facilities for winter gardening are a small conservatory, an enclosed piazza, or, more frequently, a sunny window, it is natural that I should see many phases of the question, that I should sometimes ask myself if the gardener was filling the place which is his by right of environment and technical education, if he was using both to their full advantage for the benefit of all concerned, and 'twas thus I came to choose as my theme "The Professional Gardener's Mission in Horticulture."

To begin with, what is a gardener? Webster says: "One who makes and tends a garden; a horticulturist." He defines a horticulturist as: "One who practices the art of cultivating gardens." Before proceeding further, it is well to bear in mind that he distinctly calls cultivating gardens an art, and he is an authority who is careful in selecting words to convey his meaning. In this country the man who grows vegetables for a livelihood is called a gardener, a market-gardener, and, in some sections, a trucker and a truck-farmer. We also have the florist, which embraces the man and woman who keep a flower store, as well as those to whom the title properly belongs, viz., the persons who are cultivators of flowers. We have also the nurseryman, a calling separate and distinct from these, and yet the three must be combined in one individual to make a qualified gardener, or what is generally known as the "private" gardener.

Occasionally the so-called "private" gardener is known as a "manager" or "superintendent," but it may well be questioned if he gains honor thereby. When he leaves the place where the title was assumed or thrust upon him, it very frequently is left behind, but he still remains a gardener. It also tends to create an artificial distinction between many who are equals and many in and out of the ranks believe it should be discouraged. Gardeners who have charge of public parks, cemeteries and botanic gardens, it has always been admitted, may with perfect propriety assume the name of superintendent, but the fact remains that no man who loves his craft need be ashamed to be known professionally by the "grand old name of gardener." It was a title good enough for Sir Joseph

Paxton, and his claim to fame rests largely on his work as the gardener at Chatsworth. It was a title good enough for Peter Henderson, who claimed it as an honor to the last of his days. It was good enough for his son, who, in writing his memoir, inscribed upon the title-page: "Gardener—Author—Merchant," the gardener being the foundation stone. With two such honorable examples on two continents, even if there were no others, it may well be said that no man entitled to bear it should hesitate to be called by the simple, dignified title of gardener. However, as there may be some danger of a man's true position in gardening not being defined in that word, I would suggest that the word professional be used to qualify it. In the eyes of some outside the ranks, it might have weight, and it would certainly be a proper distinction from the amateur gardener, the trucker, the nurseryman and the commercial florist. It would be well also to have all gardeners' societies known as an association of professional gardeners. It might operate to properly classify those who are entitled by education, experience and natural ability to bear the title from those who, lacking all these, are yet bold enough to call themselves gardeners and to become candidates for positions which they are unable to fill with credit to themselves, with justice to their prospective employers or with a proper regard for the responsibilities they are so willing to assume. That class would be bolder than I imagine them to be if they would, under such circumstances, assume the title of professional gardener, and the well-merited ridicule which would inevitably follow the discovery of their false pretences would be a salutary check upon others.

To have a claim upon the title, a man should be able to grow flowers, fruits and vegetables both outdoors and under glass, care for trees and shrubs, lawns and roads, in short attend to every detail connected with his calling. If in addition he knows how to attend to the details of gentlemen's farming, his services should be all the more valuable. He could then assume entire charge of a place where both farming and gardening are done, and we would, if more men were capable of this, be spared the pain of seeing one or both suffer either from incompetence or want of co-operation between the gardener and farmer.

It is to that class, then, who may properly claim the title of professional gardener that I address myself; it is to them that we must look for developments of an upward tendency and they will be held responsible for any retrogression in ornamental horticulture, for they are before all others the recognized exponents of the art. It is their mission to improve, and the general opinion is that there is room for improvement, more especially in indoor horticulture. The overwhelming tendency during the past ten to fifteen years has been to make the so-called "private place" nothing more nor less than a cut flower establishment and a hospital for the decorative plants which are used in the dwelling house and for outside decoration in summer; as pronounced has this become that the only difference between the commercial establishment of to-day and the average private greenhouse is one of size and architecture. The latter instead of being maintained, as it should be, purely to gratify aesthetic tastes, is devoted to an utilitarian purpose mainly. The product is counted and reckoned at so many dollars and cents. The most the average owner sees of them is the daily or semi-weekly cut which is sent to the house. This is not as it should be, and while it is not the gardener's fault, and may not be within his power to control, yet by well-timed suggestion and persistence, he should be able to effect a gradual and much-to-be-desired change.

The greenhouses should be a place of recreation for the owners, who should be induced to visit them daily, to look forward with pleasure to that visit, and the best way to accomplish this is to induce them to get a good collection of plants. A house of roses, carnations, violets or chrysanthemums has not the attraction of a varied collection, a collection, too, that embraces in their season gladiolus, tuberous begonias, cinerarias, cyclamens, caladiums, lilies, sparaxis, primulas, and other seasonal pot plants, both flowering and ornamental

\*Paper read by Patrick O'Mara (of Peter Henderson & Co.) before the Lenox (Mass.) Horticultural Society, January 18, 1897.

foliage. The late A. W. Bennett set a brilliant example in this line among our latter day gardeners, both at Flatbush and Schenley Park. It is freely admitted that variety is the soul of gardening and not less so in small than in large places. The individual preferences of the proprietor or gardener should therefore in some measure be rendered subservient to the amount of pleasure which visitors are sure to obtain from a variety of plants. I am well aware that in many places the proprietor's residence is of short duration and very often during the summer months only, so that it is difficult, nay, well nigh impossible, for the gardener to influence him in the right direction; but if all earnestly try, some are sure to succeed, and the example once set, it will soon become general. It must not be understood that I advocate an entire abandonment of growing cut flowers, far from it; what I urge is a wider scope for purely ornamental indoor horticulture than obtains at present.

I once felt it necessary to call public attention to the monotony of our flower shows of the present time and to suggest some remedies. That monotony still exists is patent to most people, who have visited many of them. At Millbrook last fall, a new departure was taken, somewhat on the lines then suggested and with flattering results. The exhibition in itself was as a whole equal to any I ever saw and superior in some points, but attractions outside the flowers brought people who otherwise would not come. Now, if good collections of plants were more plentiful, much of the monotony complained of could be done away with, and it behooves the gardener for his own sake and the future of horticulture to strive to get them.

This thought suggests another. It was once said that: "A garden of plants without names is like a library of books without titles." There is food for thought in that observation. Have your plants distinctly labelled so that your employers may become acquainted with them; acquaintance begets friendship and will ripen into love. How often do we see a greenhouse where the labels are few and far between and that few partially obliterated. How embarrassing for the proprietor not to be able to tell the visitor what a plant is called, and how very awkward, as is often the case, that when the gardener is appealed to, he has the name "on the tip of his tongue" and can get it no farther.

An annual prize should be offered by every horticultural society for the best labeled collection of plants in the greenhouse and grounds and persisted in until its need should disappear. Not only should the botanical name be given, but the vernacular also, when the subject has one. "What's in a name?" Why even the stars in heaven have a deeper interest for us when we know their names. But to know the names of plants alone should not suffice. The gardener should know their history and should know how to tell it when asked. An hour should be set apart at every meeting wherein the president should call upon members to tell what they know of plants in their collection, no matter if it be only a China aster (or Callistephus.) Let the man get up and give the history of its introduction, the efforts made to improve it, who did it, etc. It will at all events give him practice in telling what any visitor may ask him and will encourage study in the young men. Let the president be asked questions, too, his position should not exempt him. Try it. Many a meeting can thus be made interesting which otherwise would be uneventful.

These then should be steps in the right direction and the gardener should take them.

Another thing, study the habits of your employers and at the time they may be expected to visit the greenhouses see to it that these are fit to be inspected. Just after, or while watering is being done, is not a good time, neither is the odor of liquid manure an inducement, particularly to ladies, to visit the greenhouses, and it is largely owing to these two causes that they are often associated in their minds with the stable or a malodorous swamp. Remember that the love you bear for plants is born of intimate association, and that you have it in your power to communicate

it, but remember, also, that it cannot, except in rare cases, be communicated on sight. Be patient, therefore; an enthusiasm is contagious, but a sustained enthusiasm is convincing. Loudon says: "Delicacy and intensity depend principally upon organization, and refinement conjointly upon organization and intellectual cultivation; they cannot be communicated by instruction except in a very limited degree, and yet the influence which education may have in giving a bias to taste is so obvious as hardly to require illustration." It is surely the mission of the professional gardener to provide education and so direct taste. He should, to properly fulfill his mission, be so imbued with the lore and love of his art as to be able to say with Horace Smith:

Floral apostles! that in dewy splendor  
Weep without woe and blush without a crime,  
Oh! may I deeply learn and ne'er surrender  
Your love divine.

A tendency born of the dominating influence of the commercial cut-flower grower on horticulture at the present time is to measure the beauty of a flower by its size. We may well pause and ask with the lady who, with Attic wit, inquired: "Do we measure beauty by the square yard?" It seems so. If Burns thought thus, the world would be the poorer by the loss of his exquisite lines, "To the Daisy." The poet in all climes and all ages has ever been the oracle who proclaims the merit of true beauty, and delicacy rather than exuberance has ever been his theme in flowers. It is the mission of the gardener to preserve varieties having delicacy of color, daintiness of perfume and beauty of contour, even though they lack mere bulk. True beauty is imperishable, the rage for size is sporadic. The Colossus of Rhodes is almost a mere myth, the Apollo Belvidere is a living reality. The Venus de Milo and de Medici will endure when Miss Liberty and Germania are only memories.

(To be continued.)

#### Orange, N. J.

The Floricultural Society of New Jersey held its regular monthly meeting Monday, Feb. 1, President McRorie in the chair, and about sixty members were present. The proposition to hold a fall show received attention. Dr. Kitchen thought it was very desirable that a show be held, and fully realized the necessity of calling in outside aid, and suggested that the executive of the Memorial Hospital Committee, the ladies of the Improvement Society and the committee of the Home for Orphans be asked to co-operate, allowing them a third of the net receipts and a flower booth. This would induce all the society people of the district to support the exhibition, and success would be assured. He also suggested that a dance be held each evening.

Messrs. O'Mara, Withers and May supported Dr. Kitchen, and the Exhibition Committee was instructed to see these various bodies and report at the next meeting.

It was decided to reduce dues for associate membership from \$3 to \$1, and that all those who were not active members and had paid \$3 or more be called sustaining members.

Joseph A. Manda read a paper on the culture and care of a limited number of popular orchids.

#### Boston, Mass.

At the exhibition of the Massachusetts Horticultural Society, held on Jan. 23, Walter E. Coburn made an extremely pretty exhibit of Chinese primulas. Jason S. Bailey (William Donald, gardener) brought two new seedling double cyclamen plants, a pink and a white—the former very handsome. H. A. Cook showed a vase of the new white seedling carnation, Nivea, for which a first-class certificate of merit was awarded. James Comley brought a primrose colored seedling carnation. Mrs. E. M. Gill was awarded a gratuity for a collection of flowers, including carnations E. G. Hill, Scott, and Lizzie McGowan; Clivia miniata, Cyperus alternifolius, Fuschia Black Prince, two kinds of Begonias, Coreopsis, Frezias, Azaleas and Narcissuses. Mrs. E. M. Gill exhibited a dish of mushrooms. Aaron Low exhibited good spinach, and George D. Moore lettuce.

1897-1847

## Not Since Adam Dug

in the gardens around Eden has there been seen the peer of our "JUBILEE" CATALOGUE for 1897.

To commemorate our fiftieth business year, we have prepared the most beautiful and valuable SEED and PLANT CATALOGUE the gardening world has ever seen. Every copy costs us 25 cts. to produce, but in honor of this our "JUBILEE" year, we will send it this season FREE of tax (in stamps) to cover postage and mailing. This "JUBILEE" CATALOGUE of "EVERYTHING FOR THE GARDEN" is a magnificent book of 170 pages, on which are displayed over 500 beautiful illustrations of Seeds and Plants, the work of our own artists. Also six full-size colored plates which in artistic beauty have probably never been equaled, certainly never surpassed.

The gorgeous products of our Gardens and Greenhouses are not only faithfully pictured and described in the Catalogue, but equally so every other desirable requisite, new and old, for both Farm and Garden.

A "JUBILEE SURPRISE SOUVENIR" will also be sent without charge to all applicants for the Catalogue who will state where they saw this advertisement.

## Manwell Strawberry

Is easily in the lead (a staminate). Of large size and firmness unequalled. Its color would be hard to improve upon, the quality is superb, while the quantity of fruit it matures is simply immense, the yield being greater by one half than Wardfield, Crescent, P. Earle, Beder Wood, Bubach, or Haverland, and several others that have been in the lead. The proof of its value is its ability to outsell all others on the market, bringing for the season 1/2 more than any other variety. For description see AMERICAN GARDENING, July 4th issue, page 419. I also have the exclusive sale of the Hawkeye Runner Cutter, the best and cheapest tool made, can be used by a 12-year old boy. Send for price list to

**ALLEN D. MANWELL,**  
P. O. Box, 686, VINTON, IOWA.

We find that good returns come from advertising in American Gardening.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\*We cannot undertake to reply by mail.

### Treatment of Azaleas.

[I have a large Azalea 26 inches across top in a 7-inch pot. Should it be repotted into say a 9 or 10-inch pot, and if so, when? It has just finished flowering (over 120 blossoms). It needs pruning badly to get it into shape, as many

branches ran out very long last summer. If pruned now, how late in the season can I again cut it back, in case it straggles out as it did last season, without losing flower buds? Will Azaleas stand bonemeal in soil?—F. S. C.]

—If your Azalea really needs repotting do it at once. Azaleas need very little pot room, owing to the roots being so fine, so if you do repot give only a very small shift. Before putting into the new pot slightly disturb the root surface of the old ball, using a blunt instrument. This will allow assimilation of roots with the new soil to take place quickly. Take care to make the new soil firm when potting; the rule is to beat it with a rammer till it is nearly as solid as the ball itself. Also be careful about drainage, and make that ample,

and remember to leave sufficient space to allow proper watering. Prick off the old flowers and syringe freely, keep the plant fairly warm, and to get it shapely pull the branches into the required positions and tie them, but do not do any pruning unless it be to remove an occasional gross growth; sometimes these start from the parent stock below where the plant is grafted; if so, they must be removed. But if breaking from the plant proper they can usually be tied to advantage, and thus fill up spaces. Remember it is the new growth formed now that makes flower for next year, so that to prune is to destroy flowers. Bonemeal is injurious; do not use it. The Azalea will not tolerate fertilizers.

....BEAUTIFUL....

## Twelve Everblooming Roses

Grower's selection from leading varieties.

Of all premium offers this is decidedly one of the most tempting and we fully guarantee its absolute reliability. Grower says: "We will fill your orders with strong well-ripened plants, grown specially for the purpose, from 2½ inch pots. This is our most popular collection

and it has made hundreds of customers for us, as the testimonials in our possession will show." In this collection will be found such varieties as:

Perle  
F. Kruger  
The Bride

Virginia  
Snowflake  
Bon Silene  
Empress of China

Bridesmaid  
Pink Soupert  
Naman Cochet  
Prince Hohenzollern

Cornelia Cook  
Maurice Rouvier  
Catherine Mermet

The collection embraces a variety of colors, each plant is distinctly labeled, and the collection will make a beautiful bed. Packed in stiff, telescoped pasteboard boxes, oil finished on inside, and shipped to any address in the U. S. in good condition.

Orders for this collection can be filled at any time, but subscribers in the North and West are advised not to have their orders filled until April 1, or later.

Offer No. 47.

Sent, Postpaid, for one NEW Subscription at \$1.00.

## NEW GIANT FANCY COSMOS

(MRS. SHEPHERD'S STRAIN).

Mrs. Shepherd's New Fancy Cosmos was offered for the first time last season, but this is the first time they have been offered, put up in separate colors, as here described:

Of this strain, five packets of which are offered in this collection, the grower, Mrs. T. B. Shepherd, of Ventura, California, says:

"No one else grows it, and it is so distinct as to be readily recognized anywhere by one who has once seen the different varieties in bloom. I have been working with it so long that it has an individuality peculiarly its own."

One packet of the above, in splendid assortment, containing over 35 varieties of beautiful flowers, in all shades of red, pink, mauve, tinted and white... 15c.

Three packets of above, in separate colors, Red, Pink and White, one packet of each, at 15c..... 45c.

"Tints of Dawn," one packet of above, lovely tinted flowers, white ground, delicately tinted or flecked with pink or mauve in lighter or darker shades..... 15c.

Curled and Crested ZINNIAS, splendid mixed, one pkt..... 10c.

These are the gayest, brightest and most esthetic bedding flowers imaginable, all colors and shades, with petals daintily curled and crested, having none of the coarseness of other Zinnias.

IPOMEEA, Heavenly Blue, one pkt..... 10c.  
A perfect dream of beauty.

SOABIOSA, New Large Flowering, red and pink varieties, mixed, one pkt..... 10c.  
These are very beautiful.

Total Value..... \$1.05

The Choicest Collection of Seeds ever sent out for the money; a poem in flowers and a revelation in nature.

### Moss Rose Not Flowering.

[What is the cause of a White Moss Rose not blooming? It is six years old. I trimmed it back last spring, and it grew clean, healthy foliage. It is now 10 feet high, but not a flower on it last summer. The year before it had two perfect Roses. Is it best to prune it in the spring or not?—J. M. B., Vicksburg.]

—We would suggest a transplanting of the bush; it need not be moved from present location providing that is a sunny and suitable spot. But the replanting acts as root pruning and tends to make flowering wood. Spring is the proper time for pruning.

### Violet Disease.

(To A., S. I.—Violet disease takes two forms: sometimes the spot, and sometimes the outer edge of the leaves goes off with a rot. This last named is the more disastrous.)

### Rose Leaves Dropping.

[I send some Rose leaves which have dropped from my Roses. Can you give me some information as to the cause and remedy. The varieties grown are Belle Siebrecht, Bride, Bridesmaid, Kaiserin Augusta, and Perle. They are growing on benches; inches deep, in good soil (old soda and rotted cow manure). They make a good healthy looking growth; then the leaves, or rather many leaves, drop off. I have kept the soil on top stirred, fumigated with tobacco stems, dusted flowers of sulphur over them, and a mild solution of kerosene emulsion about 1 to 20, without any apparent benefit. The night temperature is about 60°.—A., S. I.]

—The Roses are evidently lacking nutrition. From your description of soil and temperature, it cannot be from either of these. Possibly at some time the house was run up too high a temperature, and that would cause the trouble. Or it may be the reverse of that, and by being too cold the plants got checked; or it may be overwatering. Any one or all of these will cause the trouble.

### Silo Corn Wanted.

[Can you tell me where I can procure some of the Governor Morton's Improved Silo Corn? It is a white flint corn, developed in New Jersey.—C. F. C.]

—The corn spoken of is none other than Rural Thoroughbred White Flint, and as such appears in many catalogues.

### Ermisch's Caterpillar Lime.

[Is this any good as a remedy for canker worms, codlin moth, borers etc.?—G. R., Junction City, Ks.]

"Ermisch's Caterpillar Lime," or "Raupeleim," as the Germans call it, is a sticky preparation, apparently one of the petroleum products, mixed with some other material to give it color and odor. It is a smooth, greasy substance, which on exposure tends to harden something like tar; but will remain viscid for a considerable length of time under ordinary circumstances. Under the influence of heat it tends to thin out and run somewhat, and then to become coated with a crust. It chills readily, becoming quite hard under the chill and losing much of its sticky quality. The material is applied in Germany to the base of forest and other trees to prevent them from being girdled by deer, rabbits, and mice, and has been found very satisfactory and not at all injurious. It is also used in that country for banding trees to prevent the ascent of caterpillars of the "nun" moth and other similar pests. It can be used to good advantage to prevent injury from canker worms, by smearing it on the bark very early in spring, to prevent the ascent of the females to lay their eggs. It has been tried by a number of experimenters with good success, and it remains in perfect condition a long enough time to make one application answer. After the danger season from the canker worm is over, it

should be scraped from the trunks of the trees. Instead of applying it directly, a sheet of heavy paper can be nailed on the trunk and the "Raupenleim" applied to this, a little of it being smeared over the edges at the lower part of the band to prevent the insects from getting under it. If this be done, the whole band can be torn off at any time without trouble. As against the Codlin moth the "Raupenleim" cannot be successfully applied. As against borers it may be successfully applied at the base of old peach trees or old apple trees. Experiments have shown that it should not be applied to young trees, and particularly not to young peach trees. It is to be noted in this connection that it is not improbable that the material will act differently in some of the dry western regions, from our experience in the east. The substance cannot be used in California without danger to the trees. Professor Gillette thinks that in Colorado it should never be applied directly to the bark; but that it can be used there by interposing a band of paper. Just how the material may act in Kansas it is not possible to say without experiment, and I would advise a limited use of it only until its action is understood. I believe it to be a very useful material for certain purposes; but its use is still in the experimental stage.—J. B. SMITH, Rutgers College, N. J.

#### Potting Roses.

[In setting out grafted Rose bushes in pots; should roots as well as tops be pruned? What size pots would be required? How long should the plants take to root, before bringing into greenhouse to force for spring trade?—W., Westfield, N. J.]

—Do very little if any trimming on the roots, the shifting itself is check enough. Such stock should already be potted up, and in a cool house getting settled and established.

#### Rooting Carnations.

[I find some difficulty in rooting Carnation and some other cuttings; they seem to damp off, but on examining the decayed cuttings, I find them covered with a number of little worms, so small that they can scarcely be seen with the naked eye. They are white and thread-like. Are they in the sand or in the cuttings, or do they cause the trouble?—J. C., Del.]

—We have always considered the presence of the insects spoken of, as the consequence of the disease and not the cause, believing that they find a home in decaying vegetable matter; and if the worms are in the sand it is because of the presence of such matter, in some farm or other. Perhaps it was not clean, having soil or dirt in it. Try sharper and more gritty sand, and if for anything important wash the dirt out of it, and then dry it on the top of the furnace or hot pipes before using.

#### Persian Ranunculus.

[Having tried to grow Persian Ranunculus in pots, and not having been successful, would like to get some information as to what they require in outside cultivation.—J. H., Mass.]

—The Asiaticus section, or Hardy Tuberous Rooted class of Ranunculus does not thrive as pot plants under any treatment. The soil it best likes outdoors is a good rich loam.

#### Heating Trouble.

(To Jack.)—The trouble most likely is too much fire surface for the amount of piping to be heated, consequently it heats very rapidly—a difficult matter to prevent in such cold weather. We cannot think of any plan to prevent it except to put on another pipe and to coil the feed pipe to the boiler, and carry your escape pipe out through the gable, to prevent damage from a possible overflow of hot water. To have so much hot water escape as you speak of is a loss of heat and fire; a little extra piping would reduce this.

Lily of the Valley.—(To W., Westfield, N. J.)—Read the directions given in previous issues, for instance, page 810, Dec. 19 last.

Lettuce Culture.—(To J. M., Mass.)—We refer you to the extended articles in Vol. XVI., 1895, pages 89 and 135, where the subject is very fully treated.

Fertilizer Making.—G. B. R., Me.—We cannot devote space to the discussion of manufacturing fertilizers for commercial use, which is indeed entirely outside our scope, but stand always ready to advise on matters of their application and use.

Back Numbers.—Jack.—The numbers you ask for can be had, and will be sent on receipt of price, 25c.

OWING to pressure on our columns, the descriptions of two wonderful Novelty Premium Offers are unavoidably omitted:

## YELLOW RAMBLER ROSE (Aglaia) NEW HYBRID SWEET BRIARS

One Yellow Rambler Rose, out of 2½ inch pot, for one new subscription to AMERICAN GARDENING.

Two Lord Penzance New Hybrid Sweet Briars, out of 2½ inch pots, for one new subscription.

IF YOU ARE INTERESTED WRITE US FOR FULL PARTICULARS.

**\$1.00 THE CHAMPION OFFER \$1.00**  
OF THE SEASON.

**ELLIOTT'S \$1.00 COMBINATION!**

AS FOLLOWS:

**Eighteen Full Packets Choice Flower Seeds, value \$1.50**

And, by special arrangement with the publishers,

**Am. Gardening, one year, NEW names only, " 1.00**

**Total value, - \$2.50**

**\$1.00** under the terms of this offer, therefore, gives you AMERICAN GARDENING, the brightest gardening paper issued, one year, and sufficient seed to start a goodly sized garden with some to spare for your friends. We look for thousands of responses to this the greatest bargain of the season.

### THE SEEDS OFFERED

are not of the cheap varieties which one finds advertised and described in glowing terms in all the papers at this time, but are full-sized packets, of the most reliable sorts, such as we put up for the Trade. There is not one cent of profit to us in this offer; in fact we lose money on every order we fill, but in these days it is necessary to make some sacrifices to promote business. We want to obtain new patrons to whom to send our 1897 catalogue, and take this method as the most direct means to accomplish same.

#### THE FOLLOWING IS A LIST OF THE PACKETS:

Alyssum, Sweet. Good border plants.	Cosmos, mixed. The pride of the Fall in the open garden.	Petunias, in superb mixture.
Asters, fine mixed. Select strains.	Larkspur. Fine for mass planting, the herbaceous border, or a rock garden.	Phlox Drummondii, choicest strain, elegant for bedding.
Balsam, Lady's Slipper. Finest double mixed.	Marigold, French varieties.	Poppy, Elliott's mixture, double flowering.
Calendula. Needed in every garden.	Mignonette, most fragrant of all plants.	Sweet Peas, in mixture, including all the standard varieties.
Candytuft, mixed.	Nasturtium, assorted colors.	Ricinus, Castor Oil Plant. For sub-tropical effect, very showy.
Carnation Marguerite, Mixed. A genuine novelty for the garden.	Pansies, Giant strain, assorted colors.	
Batchelor's Button. The German Emperor's favorite flower.		

The above collection is all of choice, fresh seed, in full packets, such as retail at Ten Cents each, and is not made up of cheap, unreliable or worthless stock. Our reputation in the seed trade for the past fifty years is our voucher.

If you are already a subscriber to AMERICAN GARDENING, but want the above collection, it will not take you ten minutes to obtain the subscription of some one interested in gardening. Send in this new name, together with \$1.00, money order preferred. Orders filled without delay. Paper and seeds sent to separate addresses when so requested. Address

**WM. ELLIOTT & SONS, SEEDSMEN, 54 Dey St., New York.**  
Est. 1846.

# OUR PREMIUMS ARE OFFERED

with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will) he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, a rule, be in themselves worth the full subscription price of the paper.

## Offer No. 1.

### STRAWBERRIES

Your choice of 50 plants in any two varieties below mentioned, 25 of each. Sent postpaid for one new subscription. Plants guaranteed to arrive in good condition. Plants grown in New York. Order by Offer No. and Letter.

A Beder Wood (B)	J Jessie (B)
B Bubach (P)	K Haverland (P)
C Crescent (P)	L Michel's Early (B)
D Chas. Downing (B)	M Lovett (B)
E Cumberland (B)	O Sharpless (B)
F Eureka (P)	P Warfield (P)
G Gandy (B)	R Wilson (B)

H Greenville (P)

Grower states: "I only grow the varieties I find the best for all purposes; many hundreds offer no improvement on the standard sorts now in use. Two of the finest varieties for family use are Greenville and Beder Wood, or Bubach and Beder Wood."

## Offer No. 3.

### STRAWBERRIES

Plants raised in Ohio. This was one of our most taking offers in 1896, and we hope to see its success duplicated this year.

No. A—50 Brandywine (B)  
No. B—50 Staples (B)  
No. C—50 Cyclone (B)  
No. D—50 Marshall (B)  
No. E—50 Greenville (P)  
No. F—12 plants each of Brandywine, Staples, Cyclone, Marshall and Greenville. In all 60 plants.

For one new subscription, your selection of any one of the above offers will be sent postpaid. Order by Offer No. and Letter.

If the plants are ordered by express, receiver to pay charges, the grower will DOUBLE the number of plants above offered.

A book on transplanting and caring for all kinds of plants, free with each order.

## Offer No. 4.

### STRAWBERRIES

Grown in Michigan. Any one of these three collections will be sent postpaid for one new subscription:

#### Collection A.

12 Clyde (B) 6 Glen Mary (B)  
12 Wm Belt (B) 12 Enormous (P)

#### Collection B.

12 Brandywine (B) 12 Mary (P)  
12 Satisfaction 12 Marshall (B)

#### Collection C.

One hundred (100) plants of the following varieties, not less than 25 plants of one kind: Brandywine, Beder Wood, Bisel, Barton's Eclipse, Cyclone, Crescent, Columbian, Eleanor, Gandy, Greenville, Gov. Hoard, Haverland, Iowa Beauty, Jessie, Lovett, Muskingum, Michel's Early, Parker Earle, Princeton Chief, Princess, Staples, Sherman, Saunders, Smelter's Early, Tennessee Prolific, Van Deman, Warfield, Wilton and Woolverton.

Plants will be large, well rooted, true to name, and guaranteed to reach their destination in good growing condition. Orders filled soon as spring opens up.

## Offer No. 6.

### STRAWBERRIES

15 Plants Marshall (B) and  
15 " Brandywine (B)

By mail, postpaid, for One New subscription. This collection can be implicitly relied upon as being true to name and of the very best grade of stock. Raised in New York.

## Offer No. 7.

### STRAWBERRIES

12 Ima (P) New.....50c.  
(A new seedling of great promise.)  
12 Cumberland (B).....25c.  
12 Dayton (B).....25c.  
12 Gandy (B).....25c.

This entire collection of 48 plants, valued at \$1.25, will be sent, postpaid, for one NEW subscription to AMERICAN GARDENING. Plants raised in Ohio.

Introducer's Description of Ima.—"A seedling of great merit, and a berry which, having carefully watched for the past four years, we are now convinced deserves to be enrolled among the worthy members of the strawberry family. In ripening it is about midway between the early and late varieties. It is a long pointed berry. It will ripen quickly and perfectly all over. In color, a beautiful bright red, and in size equals the Crescent or Warfield. It is a strong grower and as large a producer as any variety we have ever fruited. To sum up its meritorious points, it is perfect in color, shape, and flavor; a good shipping berry of large size and very fruitful. A profitable berry for the fruit grower to raise."

## Offer No. 16.

### STRAWBERRIES

75 Plants Greenville (P)

Raised in Ohio. Mailed, postpaid, to any address for One New Subscription:

Berries of large size, good quality, medium texture, very productive, season medium to late, color very even and fine, flowers pistillate, plants very vigorous and free from rust. A first-class market berry and good enough for home use.

## Offer No. 18.

### COLLECTION OF 125 STRAWBERRIES

Good plants and named. Delivery postpaid, on and after April 1. Plants raised in Maryland.

Meek's Early (B.)  
Baltimore.  
Sharpless (B.)  
Levianth.  
Kentucky Late.

Grower says: Kentucky Late is a berry that is largely grown here for market and shipping purposes, coming in after the glut of other varieties is over; it is a very late berry, extending the season sometimes two weeks.

Levianth, very large, vigorous grower, suitable for family use where an extra-sized berry is looked for; fruit rather tender.

## Offer No. 51.

### LOUDON RED RASPBERRY.

Five (5) Plants for one new subscription at \$1.00.

This Red Raspberry is pronounced by Mr. Thayer and other leading horticulturists as the best of all reds for the East and West. It was originated by F. W. Loudon, of Wisconsin, originator of Jessie Strawberry.

## Offer No. 8.

### STRAWBERRIES

Your choice of fifty (50) plants, in two varieties, 25 of each, or 50 of any one variety. Free by mail for one NEW subscription.

A.—25 Brandywine	H.—25 Tennessee
B.—25 Murray's Extra Early (P)	I.—25 Prolific (B)
C.—25 Michel's Early	L.—25 Cyclone (B)
D.—25 Lovett (B)	J.—25 Bisel (P)
E.—25 Isabella (B)	K.—25 Greenville (P)
F.—25 Rio (B)	L.—25 Sunnyside (P)
G.—25 Lady Thompson (B)	M.—25 Weston (P)
	N.—25 Staples (B)

Order by Offer No. and Letter.

The above collection is a good one, and are all standard sorts, embracing the earliest and latest varieties. All nice plants and true to name. Raised in Virginia.

Rio is a fancy berry for early, and one of the best shippers; planted beside Bisel they make a splendid variety to ship together.

## Offer No. 15.

### STRAWBERRIES

25 Brandywine (B)  
25 Staples (B)

This collection will be sent postpaid to any address in the United States for one new subscription. Guaranteed to reach customers in good condition. Plants are extra rooted, and positively true to name. Will be mailed at any time after April 10. Plants raised in Ohio.

## Offer No. 13.

### STRAWBERRIES

Below mentioned collection of 36 Fine Plants will be sent, postpaid, for one new subscription. Grown in Maine.

New Seedling No. 4, 12 plants.  
12 plants of the celebrated Brandywine.

And your choice of 12 plants of any one of the following most popular standards: Bubach, Haverland, Warfield, Beverly, Parker Earle, Lovett, Princeton Chief.

Of Seedling No. 4, grower says: This is of exceedingly fine quality—the best of anything I have ever tasted, and so say they all who have sampled it. Good form, medium size, very productive, and a most remarkably strong and healthy grower. An A1 family berry, and a grand one for a nearby fancy market that appreciates quality. It has a pistillate blossom. Those who avail themselves of the present opportunity to procure this grand berry will be among the wise as, in the course of two years' time, it is likely to be introduced under name at \$2 per dozen.

Grower offers 36 plants in all, in three varieties packed in the best manner, for delivery in April or May, and says: These plants of standard varieties must not be confounded with the common commercial article, but comprise carefully selected stock that has been built up by an attentive selection of the best individual plants each year, for five consecutive years, by one of the most noted growers of fancy strawberries in the Eastern States.

## Offer No. 21.

**STRAWBERRIES**

Your choice of twenty-four (24) plants in two varieties, twelve (12) of each, or 25 of any one. Free by mail for one NEW subscription. Raised in Virginia.

12 Mary (P)	12 Aroma (B)
12 Edith (P)	12 Pride of Cumberland (B)
12 Splendid (B)	12 H. W. Beecher (B)
12 Enormous (P)	
12 Wm. Belt (B)	

The above comprise some of the largest berries in cultivation, particularly Edith. These are all nice plants and true to name.

## Offer No. 26.

**STRAWBERRIES**

Raised in Pennsylvania. Subscriber's choice of any one of these varieties sent postpaid for one new subscription. Order by Offer No. and Letter.

A-15 Glen Mary (P)	I-20 Ideal (B)
B-15 Clyde (B)	J-20 Oriole (P)
C-25 Michigan (B)	K-20 Howell's No. 2
D-25 Wm. Belt (B)	L-10 Flow City (B)
E-25 Champion of England (B)	M-60 Brandywine
F-25 Equinox	N-60 Enormous (P)
G-25 Sparta (B)	O-60 Bisel (P)
H-25 Murray	P-60 Staples (B)
	Q-35 Gertrude

All plants to be freshly dug and well packed in moss; all inferior plants discarded and only the best sent.

## Offer No. 9.

**STRAWBERRIES**

For One New Subscription at \$1.00. Plants raised in Indiana. Order by Offer No. and Letter.

- A.—Postpaid, six plants Ridgeway.  
 B.—Postpaid, three plants Ridgeway, three plants Tennyson, three plants No. 1000, six plants Parker Earle.  
 C.—Postpaid, three plants Ridgeway and one dozen plants, one variety. Your selection from this list: Brandywine, Clyde, Annie Laurie, Jersey Queen, Aroma, Moore's Prolific, Mary, Premium, Berlin, Tubbs, Parker Earle, Holland, Gen. Putnam, Dew, Columbian, Tennessee Prolific, Lady Thompson.  
 D.—Postpaid, three dozen plants, not less than one dozen of a kind, any variety named in C, the Ridgeway excepted.  
 E.—By express, at purchaser's expense, three plants Ridgeway, and 100 plants, not more than two varieties. Your selection from this list: Brandywine, Clyde, Dew, Holland, Gen. Putnam, Jersey Queen, Columbian, Lady Thompson, Tennessee Prolific, Annie Laurie, Staples, Parker Earle, Splendid or Isabella.

This is the first season the Ridgeway will be placed on the market, consequently our readers are given an opportunity to be among the first in the cultivation of the promising berry. Description is as follows:

**Ridgeway.**—Plant large and stocky, possessing the ability to make a large number of strong, healthy plants. Leaf large, broad, heavy and dark green in color. Blossom perfect, a good pollenizer for pistillate varieties, as it remains in bloom for a long time, an ideal plant.

Berry large to very large, the typical form nearly round, largest specimens broadly ovate, but always smooth. Color, as it grows at Rocky Glen, bright glossy crimson, with golden seeds. Firm for so large a berry, and will stand shipping to distant market, except in a very wet time. Quality as good as the best, an almost ideal berry, one that will command fancy prices on any market or suit the most exacting grower, who wishes the very best for his own use and pleasure.

Orders will be filled as early in the spring as conditions are favorable for shipping.

## Offer No. 22.

**STRAWBERRIES**

50 Plants Fountain Strawberry. Raised in Michigan. Sent, postpaid, for one new subscription.

One of the later introductions that is receiving much praise. The Fountain is described as large and handsome, of a deep, glossy, red color, flesh red and solid to the center. Firm and productive. Plant large, vigorous, healthy and hardy, with a perfect blossom. The grower who offers this variety states that it is one of the best all around good berries in his collection of over 100 varieties, and one that is likely to be in great demand in the near future as a choice shipping variety.

## Offer No. 23.

**STRAWBERRIES**

Grown in Michigan. The following collections are offered, postpaid, for one new subscription:

Collection A.  
 12 Beder Wood (P) | 12 Greenville (P)  
 12 Lovette (B) | 12 Haverland (P)  
 12 Woolverton (B)

This collection will be sent as advertised, or will give subscriber the choice of 75 of any one of the above varieties.

Collection B.  
 25 plants Gold Standard (B).

Grower says: This is a strong growing variety, large round leaves, free from rust, one plant weighs as much as two common plants. The fruits averages from one to one-and-a-half inches, light red in color, and the sweetest berry we ever tasted. Season late. Strongly staminate.

## Offer No. 27.

**STRAWBERRIES**

Your choice of any one of the below mentioned collections, postpaid, for one new subscription. Raised in Ohio.

A-25 Greenville and 15 Lovett.  
 B-40 Lovett or 40 Dayton Early.  
 C-20 Bubach No. 5 and 20 Jessie.  
 D-40 Warfield and 20 Cumberland.  
 E-20 Haverland, 10 Dayton, 10 Parker Earle.

In the above collections when one is a pistillate sort the other is a perfect bloomer, so that they can be planted together perfectly.

## Offer No. 28.

**STRAWBERRIES**

This collection will be sent for one new subscription. Plants raised in Wisconsin.

25 Plants Sparta.  
 6 " Thayer's No. 5.

The Sparta is Wisconsin's premium berry (staminate), very large, beautiful in color, and a great favorite with M. A. Thayer, who introduced it. Thayer's No. 5 is a new seedling, originated on the Thayer Fruit Farms, and this year for the first time sent to any one.

## Offer No. 29.

**STRAWBERRIES**

Sent postpaid for one new subscription. Plants raised in Michigan. Strictly first-class plants, mailed same day they are dug, put up in sphagnum moss, wrapped in oiled paper to retain moisture. Your choice of two kinds, 18 of each; or 25 plants, one kind, good count. No orders filled after April 15th. I offer the following varieties:

Brandywine (B)	Splendid (P)
Greenville (P)	Bisel (P)
Bubach No. 5 (B)	Lovett (B)
Parker Earle (P)	Jessie (B)
Haverland (B)	

## Offer No. 24.

**STRAWBERRIES**

A-50 Plants Brandywine (B)  
 B-12 " Bismarck (B)  
 C-24 " Wm. Belt (B)

Order by Offer No. and Letter. Subscriber's choice of any one of these three varieties for one new subscription. All first-class and new varieties. Grown in Michigan.

## Offer No. 25.

**STRAWBERRIES**

We will send Twelve (12) plants, two each of the following varieties: 2 Carrie; 2 Earliest, the earliest berry yet introduced; 2 Equinox, the latest; 2 Clyde, one of the earliest, will do better where land is not too rich; 2 Belle; 2 Evans. One dozen in all of these choice novelties. Select plants and guaranteed true to name. Raised in Virginia. Sent, postpaid, for one NEW subscription.

## Offer No. 30.

**STRAWBERRIES**

Your choice of any one of the following offers, postpaid, for one new subscription. Order by offer No. and Letter. Plants raised in Maryland.

Every Gardener Needs a

### ...GOOD GOOSEBERRY...

And, we will send two one-year plants, of the best new variety known, for one new subscription; safe delivery guaranteed.

## THE PEARL GOOSEBERRY.

Read what the Introducer has to say:

"The Pearl is a gooseberry grown from the seed of Houghton, crossed with Ashton seedling, by Prof. Wm. Saunders, and worthy of special notice because (1) of its good quality; (2) its size; (3) its productiveness; (4) its freedom from mildew. As a result of my observation I find the quality good, very much like the Downing in this respect, as well as in color marking; but in size it averages nearly double that berry, and that in spite of the prodigious crop under which the bushes are laden. There was a row of some sixty fine bushes one year planted, and most of them were literally bent to the ground with heaps of fruit. The average was eight berries per inch of wood, and on one bush we estimated that there must have been 2,500 berries. Should this productiveness prove constant the berry will be of great value for the market. With regard to the mildew, all I can say is what I have seen, namely: After seven years of trial I have never found any trace of mildew."

## Offer No. 57.

### Collection of Flower Seeds

Sent, postpaid, for one new subscription to AMERICAN GARDENING. The following list embraces 16 varieties of choice flower seeds; fresh and true to name, eight of which are of 5 cent packets, six of 10 cent packets, and two of 15 cent packets; valued in all at \$1.30. This collection is offered by a reliable grower, in whom we have full confidence.

Alyssum, Sweet	Nasturtium, Dwarf
Asters, mixed	mixed
Cosmos, Large	Poppy, Carnation
Flowered	flowered, mixed
Calendula, Price of	Sweet Peas, Eck-
Orange	ford's mixed
Calliopais, mixed	Heliotrope

mixed	double
Carnation Marguer-	Cobaea Scandens
ite, finest double	Zinnia, Double,
mixed	mixed
Mignonette Machet	Lobelia compacta

## Offer No. 42.

For one NEW subscription at \$1.00, receiver to pay express charges, or by mail, postpaid, for \$1.25.

### 25 NIAGARA GRAPE VINES

Comment on this offer is unnecessary, beyond stating the fact never before was such an opportunity offered to start a vineyard at so small an outlay.

## Offer No. 40.

### THE COMPLETE

## Flower Garden

This is a collection which everybody should be sure to obtain. It only requires one NEW subscription to become the possessor of all the plants here mentioned. Ready for delivery May 1st. Postpaid. Grown in Maryland. Save time growing from seed and get this lot all ready to set out.

10 Antirrhinums,	10 Phlox Drum-
choice mixed.	mondii, mixed.
10 Asters, mixed.	10 Marigold Eldora.
10 China Pinks,	10 Scabiosa, mixed.
mixed.	choice.
10 Cosmos, choice	10 Zinnias, mixed,
mixed.	choice.
10 Petunias, mixed.	10 Scarlet Sage.

100 Choice Flowering Plants and AMERICAN GARDENING, one year, to a NEW name, for only \$1.00.

## Offer No. 43.

## COLLECTION OF ROSES.

From Maryland. Strong 2-inch pot grown

p'ants. Delivery on and after April 1, postpaid.

## One Crimson Rambler

One Perle One Meteor  
One Safrano One Papa Gentier  
One Mme. Camille One Hermosa  
One Marie Guillot One La France  
One Niphetos One Bride  
One Bridesmaid

Surely the good things of this earth are open to everyone who exhibits a little energy. Realize you can obtain the above set of Twelve Magnificent Roses as a premium for one new subscription to AMERICAN GARDENING, and that it will not take you more than a few minutes' work to accomplish this, then send and get your reward.

## Offer No. 41.

## GREENVILLE APPLE.

(Downing's Winter Maiden Blush).

For one new subscription we will send by express, receiver to pay charges,

Four 3-Year-Old Plants.

Read the description: This fine apple was produced from seed of the Fall Maiden Blush by Jason Downing, in Darke County, O., in the Spring of 1774. It made a vigorous growth, and at the age of 7 years it bore some excellent fruit, from which time it has produced fruit annually. The originator states that in 1888, at the age of 14 years from seed, it yielded 15 bushels of picked apples. Grower has been noticing the behavior of this apple for the past 10 years, growing it both in nursery and orchard, and from the weight of testimony in its favor, has decided to grow it in quantities to supply the increased demand. Description: Fruit large, irregular, sometimes flattened, and at other times slightly elongated, inclining to conic; generally angular, skin light waxen yellow, with a bright red cheek in the sun; stock short, usually projecting half as high as cavity, though in a few specimens it projects to its surface and beyond, inserted in a deep cavity, often surrounded with russet; calyx small, basin of moderate depth, flesh yellowish, crisp, tender, juicy, with a very pleasant, mild, sub-acid flavor. It has a fragrant odor; quality very good. Season, December to April. Tree a good grower and bearer.

## Offer No. 53.

## HARDY EVERGREENS.

Your choice of any one of the below offers of Hardy Evergreens for one NEW subscription. This is a great big offer for the money, and invaluable to any one wishing to set out a young plantation. Plants from Illinois.

- A—50 Scotch Pine, 6 inches.
- B—50 White Pine, 4 inches.
- C—50 Norway Spruce, 3 to 4 inches.
- D—50 American Arbor Vitae, 4 inches.
- E—25 Red Cedar, 4 inches.
- F—25 Hemlock Spruce, 4 inches.
- G—15 Blue Spruce, 4 inches.
- H—25 Douglas Spruce, 4 inches.
- J—15 Picea Concolor, 4 inches.

## Offer No. 58.

## CHRYSANTHEMUMS

This collection comprises a very fine assortment of eleven standard large flowering varieties, from 2½-inch pots, good plants, and will be sent, postpaid, for one new subscription; plants grown in Maryland. Ready for delivery on and after April 15. These plants will do well outdoors in mild climate, whilst in more exposed sections to bring them to full maturity in the fall they should have partial shelter.

Mdme. F. Bergmann.—The earliest of all large varieties; color white, of great excellence.

Ivory.—A popular favorite; very dwarf and free flowering.

Miss Minnie Wanamaker.—Pure white Japanese; one of the standard varieties.

Golden Wedding.—The most exquisite yellow Japanese extant.

Eugene Dailledouse.—Monster flowers; yellow Japanese.

W. H. Lincoln.—The champion late flowering yellow; a grand variety.

Col. W. B. Smith.—Japanese incurved bronze.

Mrs. J. G. Whilldin.—Earliest of the Japanese yellows. In flower same time as Mdme. F. Bergmann, Oct. 4 to 7.

V. H. Hallock.—Color rosy pearl; Japanese.

Maud Dean.—The most charming pink Japanese ever introduced; a good market variety.

Cullingfordii.—A reflexed variety of good reputation; color deepest crimson.

## Offer No. 61.

## THE CELEBRATED

## GREEN MOUNTAIN GRAPE

One 2 or 3 year vine and one 1 year vine; two vines in all. Sent, postpaid, for one new subscription.

The Celebrated Green Mountain Grape is fast coming to the front and is bound to stay. It is acknowledged to be the earliest good grape on the market. It is the most delicate and delicious grape grown out of doors. It is a strong-growing, healthy vine, an enormous and early bearer, with well shouldered and handsome bunches.

No one grape possesses so many merits as the Green Mountain. The firm making this offer are headquarters for this vine and have over an acre out as a vineyard.

## Offer No. 51.

Sent, Postpaid, for only one NEW Subscription at \$1.

## TEN FINE

## CHRYSANTHEMUMS

NEWEST, EARLIEST, BEST.

In Splendid Assortment of Varieties,

Forme, Substance and Color.

Mrs. Higginbotham. Best of all Ostrich Plumes.  
Gloriana. The pretty twisted petalled yellow.  
Marie Louise. A grand white.  
Pitcher and Maud. A variety of two colors.  
Kate Brown. Earliest and best for the garden.  
Flea Smith. A robust pink.  
Silver Cloud. Pale salmon.  
G. W. Childs. Finest of the reds.  
Major Henshaw. The best yellow.  
Mrs. Henry Robinson. The queen of all the whites.

Amongst all the wealth of Flora's bountiful store, and the wonderful offers by the various growers who have contributed to our rich and varied premium list, there will be found none more enticing nor more valuable than the above. Requiring but a minimum of care in warm localities and slight protection to mature in more severe climate, and rewarding the cultivator with a wealth of bloom at a time of the year when the other glories of the garden are fast disappearing, what flower lover would ignore the claim of the Chrysanthemum? And where, we ask, will you find a duplicate of this wonderful offer? This collection comprises several different types, incurved, reflexed, early, late, ostrich plume, variegated, as well as a representation of all colors.

## Strawberries in Matted Rows.

It strikes me that friend Greiner's "Some Notes on Fruits" in your issue of January 30, are somewhat misleading in relation to strawberries when it is said, "in order to have a full crop we must have full matted rows." This statement without any qualification would lead to a heap of trouble and loss; for "full matted rows" with most people would mean all the plants that would naturally root in the average matted row.

Now many other fruit growers as well as I, know from dearly bought experience that in the case of the free running varieties that the strawberry plant itself is the worst weed of the strawberry bed, and if all are allowed to take root they crowd out all hope of first-class fruit and greatly diminish the chance for a full crop. Few, if any of our very best cultivators now allow plants to mat so thickly.

The only "full matted row" that it is safe to depend on is one 18 inches to 2 feet wide, with plants evenly dis-

tributed not closer than 6 inches apart. Such rows yield heavily where plant food and moisture are abundant, and may be formed by striking runners first when wanted, and keeping the rest cut off, or by letting plants mat at will in the old way, then trimming out the surplus in early September.

According to Prof. Hutt, Warfield ranks first in yield; here in the East this variety is a tremendous plant maker, and if allowed to mat freely is a moderate yielder of inferior berries, while in narrow rows or well thinned, matted rows it is fine. Clyde and Isabella are both enormous yielders of berries of great size; they are also great plant makers, and will not do their best in "full matted rows." Plants need light, air, and moisture, and it is not reasonable or fair to expect a strawberry to do its best when overcrowded and thirsty. For my plant trade I grow many acres of strawberries in thickly matted rows, and whatever are not sold are left for fruitage. My brother, just across the way, on similar land, and with the same varieties in thin mat-

FIG. 35.—NEW GIANT MARGUERITE: SLIGHTLY REDUCED. (See page 108).

ted rows beats me in yield and quality of fruit every time.

The Tennessee strawberry, I note, is spoken of by a few as not a great yielder, and by many others as one of the best early varieties; it is another great plant maker, and I think that those who prize it so highly are those who do not attempt to fruit it in "full matted rows."

J. H. HALE.

South Glastonbury, Conn.

### That Plant Registration Bureau.

After reading the many excellent contributions to your journal on this subject, I am fully convinced that, as Mr. Corbett says (page 36), "the person who neglects to secure official recognition will be disregarded by enlightened buyers."

But can we not already secure official recognition? To be sure, we have no "registration bureau," but we have a Division of Pomology, and any one who discovers or originates a new fruit or vegetable or nut or anything of the kind would certainly be more than foolish if he did not submit it for inspection before he introduced it. There is no way that I can see to register such a thing as an apple, strawberry or potato; it has to have some distinguishing characteristic before it can be done. Can you so minutely describe a strawberry as to distinguish it under all conditions from any other? Merely registering Bouncer, Greenville or Gandy will not help the sale much nor protect the public from fraud, as, while the variety may be all the originator or the registration bureau claims it to be in their respective localities, when taken away it may not compare with others. The Albemarle or Newtown pippin apple is a great success in some portions of Virginia, but when taken elsewhere how does it behave? The bureau could certainly say it was of the best quality and brought the highest prices known, but would this help the average grower if he could not grow it? The chemist who analyzes a particular brand of fertilizer knows it contains so much phosphoric acid, potash or ammonia, but how is the registration bureau to be able to do more than simply register the name of a new fruit, and full description as seen in a particular specimen? Good or bad qualities, soil, climate and other conditions make such changes it would hardly be a safe undertaking.

As the matter now stands, we can send a new fruit to the United States Pomologist, and if it be deserving he will describe it in his annual report as promising or desirable, and this certainly is an advantage as far as it goes. Any intelligent grower or originator of new fruits, flowers or vegetables will thus submit samples.

Mr. Ridgeway is certainly correct when he says substantially that station reports count for little. The worst strawberry fraud we have had in many years was the Van Deman, "fully tested" and favorably reported by almost every station in the United States, yet when planted commercially not one grower in ten made a success of it; and a strawberry can be tested in a few years, but a pear, peach or apple cannot.

I don't want to be understood as throwing cold water on the proceedings, but we must have a better plan than has been suggested so far. No one would be more glad than I to see originators liberally rewarded for all they have done, and I know they rarely, if ever, realize any fair compensa-

tion for their labors. The skill and labor expended to produce a new fruit, flower or vegetable are greater than to invent an electric motor or a mowing machine, but the compensation does not stand in like proportion.

A few years ago I wrote a letter to the "Country Gentleman" on the same lines as Mr. Ridgeway's in regard to trial grounds. Every intelligent, up-to-date grower must have such, else how is he to know what to plant? The man who would plant a peach or pear or apple orchard on this peninsula and select the varieties that were standard only twenty years ago would, to use an everyday expression, "not be in it" now.

Twenty years ago the bulk of the trees in a peach orchard here would have been Troth's Early; now it is never planted. The Kieffer pear has displaced almost every other variety, and the old Wilson strawberry cannot be found outside a few nursery catalogues. We must have our own trial grounds, and they do not cost much.

Del. CHARLES WRIGHT.

### Horticulturists Lazy Club.

Many of the more important papers and journals of interest to the horticulturist and florist are received at the Lazy Club room, Cornell University, and that the attention of the members may be called to as many of the leading articles as possible, a member is appointed each week to review the publications received, and report at the following meeting.

#### Arctic Flora.

At a meeting on Jan. 25, J. O. Martin gave a sketch of his recent trip to Greenland. A party from Cornell, accompanied Lieutenant Peary in his expedition to Greenland the past summer. They landed July 7 and remained at various points along the coast in all about two months.

In substance the speaker said: The northernmost station inhabited by white people is Upernavik. This is in latitude 74.10. The climate here is very rigorous, and the arctic sun shines only about three months, setting in September. The soil is very shallow and is found only in hollows and crevices between the rocks. All the herbage is much dwarfed, the tallest growth being not more than sixteen or eighteen inches high, and it attains this height only in the most sheltered and favored places. Species of the willow are quite common, and these are frequently found with branches five or six feet long, but of a trailing habit.

Of the 379 species of plants which have been reported from Greenland, the Cornell party collected about one hundred species in the short time which they were there. Among them, the willow, heath, saxifrage, sedge, poppy are the most common.

The growing season extends over a period of six or eight weeks. The plants, however, make the most of this short time and grow with remarkable rapidity while the favorable season lasts, though some species take the precaution to flower and ripen their fruit before making growth. By the first of August many of the plants were past full bloom and some had even gone to seed.

Mr. Martin does not agree with the commonly accepted notion in regard to the intense brilliancy of the Arctic flowers, but thinks that they are no more bright than those with which we are more familiar. Possibly the contrast of the colors of the flowers with their bleak surroundings has given rise to the common idea. One of the photographs represented the Arctic poppy, *Papaver nudicaule* var. *arcticum*, with its blossoms growing up through the snow.

The summer temperature as recorded by the party ranged from 26 to 56 degrees Fahrenheit above zero. The frost never leaves the ground beyond the depth of a very few feet.

H. P. GOULD.

### Plant Beauty.

At a recent meeting of the Massachusetts Horticultural Society, Mr. Henry T. Bailey, State Supervisor of Drawing, lectured on this subject. The hints contained in the following abstract will be of value as guides to those who use flowers as indoor decorations:

"Plant beauty is of two sorts, beauty of color and beauty of form. In some plants, like the calla, beauty of form predominates; in others, like the paeony, beauty of color; in still others, like the gladiolus, the lines of stalk, flower and bud are as noticeably lovely as their colors. Plants conspicuously beautiful for their form should not be gathered together in tight bouquets; each should be enjoyed by itself or with two or three companions so grouped in a vase or other receptacle that the beautiful lines of each are enhanced by those of the others. Plants of lovely color, on the other hand, are more effective when massed. One snowball is insignificant; a bushel basket full of branches crowded with the balls of creamy white glowing against the rich green of their foliage is highly effective. In the arrangement of flowers of beautiful form, we have much to learn from the Japanese.

"The Studio for October and December, 1896, has suggestive articles with more suggestive illustrations of the fine art of flower arrangement as practiced by the floral artists of the Sunrise Kingdom. Mr. Conder's book on the subject will repay thoughtful study. Even the Japanese prints, now so easily obtainable, are not to be despised by the wide-awake florist.

"Form beauty is dependent largely upon contrast, proportion, and curvature, and the grouping of plants or sprays is to be governed by the law of balance.

"Beautiful color has such qualities as purity, gradation, depth; and when colored flowers are massed, harmonious relations of the different hues should be secured.

"There are five typical color groups or harmonies. The first may be called a contrasted harmony. All green leaved plants with white flowers are in this group. The second is dominant harmony, produced by combining tints and shades of one color, as for example a head of hyacinths or a bunch of double violet asters with no green foliage in sight. This combination of tints and shades, so common in the decorative arts and in dress goods, is rarely found in nature, and is least satisfactory as a harmony. The third is analogous harmony, composed of related hues of color. All green-leaved plants with yellow flowers are in this group. A bunch of gladioli tinted with violet-red, crimson, rose, scarlet, and salmon, forms an analogous harmony of exquisite beauty. The fourth is complementary harmony—a harmony brought about by the juxtaposition of complementary colors. A violet-red camellia seen against its glossy green leaves is a complementary harmony; so also is a bunch of violets with their rich yellow-green leaves. The fifth is perfected harmony; a color group composed of analogous hues combined with a color complementary to the general effect of all the group. For example, the gladioli forming an analogous harmony if placed against a background of old *Ampelopsis* leaves, of rich bluish green color, would be greatly enhanced in color effect, and the whole would form a perfected harmony. A bowl full of pansies is in perfected harmony. The analogous group runs through varying hues, from pure yellow in the flower centers to the yellowish-green of the foliage. The complementary to the effect of this group is to be seen in the rich purple of the petals.

"The American people are becoming more sensitive to beauty every year. The florists who furnish flowers to decorate their homes and halls can do much to elevate public taste. A really beautiful thing is always attractive. What was true of Emerson is true for us all. Speaking of beauty he said:

"When first my eyes saw thee  
I found me thy thrall."

It costs no more to make a beautiful bouquet than to make an ugly one, and ultimately he who produces beauty gives the greater pleasure and receives the larger reward."

## The Vegetable Garden.

**Egg Plant, Tomatoes and Peppers.**—If not already started these should now be sown in flats or pans. We prefer to cover such seeds with clean sand, as they will then come up more evenly. Cover with a pane of glass, over which should be placed a piece of brown paper, to be removed after germination takes place. The glass should be reversed daily, so that the accumulated moisture on the underside can dry off. It is a good plan to plunge the flats to the top in a bottom heat of about 70 degrees. Care should be exercised in watering these plants while small. The best method is to immerse the pan or flat in a tub containing sufficient water to reach three-fourths of its height, allowing the water to soak upwards.

**Carrots, Beets.**—A mild hot bed made with one foot of hot manure, covered with six inches of good rich loam is admirable for an early crop of these. A few seeds of Early Forcing Carrot can be sown broadcast, and the seedlings when large enough thinned out to two inches apart, the largest to be retained and the roots used in succession as ready to give room to the others.

be secured; the seed stores now supply a very convenient wire support. Powder bellows distribute hellebore and tobacco dust better and more economically than the hand. Raffle for tying, insecticides, fertilizers, nitrate of soda, wood ashes, plaster, soot, etc., all will be needed later on, and supplies should be got in.

**Out of Date.**—The case of a nearby farmer which has just come to my notice is worthy attention. He has for years been growing vegetables to sell in the villages, and although possessing, right on his own premises, the materials ready to make a complete hot-bed, it never occurred to him that by utilizing these he could raise all his own plants, having always purchased them from a greenhouse. Thus, a good percentage of his profits were lost to him. Had he invested one dollar a year for a good gardening paper, and set aside one hour of one evening weekly to its perusal, he would have learned much to his own advantage and profit. It does not pay to be lacking in mental capacity, as, without a knowledge of the best and latest methods of culture, no amount of industry or hard work will make the business successful.

W. M. EDWARDS, R. I.

FIG. 36.—NEW HELIANTHUS. (See page 103.)

Early Egyptian beet sown in the same manner should be thinned out to three inches apart, and the plants may be readily transplanted into other beds for succession. Ventilate freely every fine day.

**Early Spinach.**—This may be sown as directed for carrots, but if space be not available it will grow in a cold frame in a sheltered corner, if protected during frosty weather. This will give a crop much earlier than from outside sowings. A three-inch potfull of nitrate of soda to a sash well mixed with the soil before sowing the seed will induce a vigorous growth.

**Mint.**—A few roots of this planted in the hot bed will be useful before Easter.

**Spring Catalogues.**—These are now distributed and should be carefully examined, otherwise something wanted will be overlooked. The best varieties suited to our wants and locality must be selected. To avoid the rush seed should be ordered at once. It is better to have a supply on hand on time than risk any delays when the planting season opens.

**Garden Requisites.**—For convenience it is necessary to have many sundries on hand. Tomato supports of some kind should

be secured; the seed stores now supply a

house, was eminently satisfactory. Great care should be exercised in selecting seeds for winter forcing crops, as the expense connected with the work is too great for worthless varieties to be grown.

**Cauliflower.**—Keep the soil stirred about the plants. They are moisture-loving plants. If allowed to dry, buttons will result. Cauliflower as a rule does not amount to much in the house after March; but a hotbed should be made at once and nice young plants set in it. A useful crop will result in April or the first part of May. Cauliflower will also make rapid headway in a frame, especially where there is a little bottom heat.

**Tomatoes.**—It may be interesting to the readers of American Gardening to know why I claim Sutton's Best of All to be superior to Lorillard. In a few words the reasons are: It matures more quickly than Lorillard. We had Sutton's carrying fifty perfect fruits to the vine, when Lorillard did not average more than twenty-five. This was in the month of January, which is the crucial month. A good free-setting tomato for winter forcing is worth having.

W. TURNER, N. Y.

## The Fruit Garden.

**Manure for the Bearing Trees,** and they all need it every year. If you have not given the annual coat, it may be applied at the first opportunity; a little snow will not be in the way, and labor, horses and carts are more readily secured now than later. Have you noted the contrast between fruit on a Bartlett pear growing in cultivated ground and getting its due allowance of food and that on another tree that does not, and even also shows misfeeding? Both styles can be seen without traveling far.

**Peaches.**—The many sudden changes of temperature experienced this winter are likely to seriously affect the fruit prospects. The pruning of the trees should be left to the very last possible moment.

**Blackberries.**—The pruning of the laterals is often overdone (to make the lines look well), and so we get more wood than flowers. Leave the laterals quite long—fifteen to twenty inches—and cut out the small canes, unless you want to plant another line. The time to decide on the number of canes for bearing next season is when cultivating in summer.

**The Fruit Cellar.**—This will need attention more frequently as the days lengthen, and there are greater variations in outside temperature. Than the cellar few places connected with the garden are more interesting when every corner is kept snug and clean, or more disgusting when rotten fruit is visible.

**Winter Pruning.**—When there is a foot or more of snow on the ground a man does not feel like whistling when pruning, even if the temperature is above the freezing point and neither do I think pruning necessary work when the wood is frozen and the pruner's feet very little better, for there are plenty of days for the work when it will be better for both. Don't hurry too much. There are a few other items which can be attended to just now; such are seeing if there are any tools, etc., needed for the summer, light ladders, saw benches, berry baskets, hand barrows, stakes for trees, lists of fruits wanted. We are getting into the time of year when there has to be some hustling done in other than the fruit departments.

J. HOLLOWAY, L. I.

## The Forcing House.

**Cucumbers,** from this time on, will make rapid growth. Still, when the vines are making rapid headway and probably a little soft tissue, care must be exercised in regard to airing, etc., otherwise mildew will set in, and that means disaster. It is poor policy to allow the temperature to rise above, say 65 degrees, without having a chink of air on, it does not matter whether the crop be cucumbers or any other.

**Strain of Seed.**—All growers will agree that Telegraph is one of the very best varieties for winter forcing, if the true Telegraph can be had. Why is there so much inferior so-called Telegraph cucumber seed put on the market? I have seen cucumbers forced on and off for twenty years, and know a good strain when I see it. If the true strain be not in the seed disappointment will follow. I do not know that I ever had stronger growing vines than this winter, but the fruit was of a mighty poor quality, though plentiful. I would much rather have had half the quantity and perfect quality. The treatment is not to be blamed, for a plant of Sutton's Progress cucumber, growing in the same

**Tests on Cabbages.**—Three varieties were grown at the Maine station to test the effect of size of seed on the heads. In two varieties the larger seed was found to produce much heavier heads. Tying up the outer leaves was found to have no influence upon the maturity of the head, while it caused a marked decrease in size, the moisture collecting within the leaves almost invariably caused the heads to decay. Mulching the plants with swale hay produced heads slightly larger than were borne by unmulched plants. But little effect on the size of the heads was produced by deep cultivation, but the plants appeared to mature more uniformly than when shallow cultivation was given.

# Novelties of the Season.

*In this issue we continue the presentation of a selection of the Novelties of the Season, as seen in the various trade catalogues and lists. The present series will be followed up by others during the next few weeks, when fruits and vegetables will also be included. The descriptions given are those of the introducers.*

## THE NEW GIANT CALIFORNIAN DAISY.

(*Chrysanthemum Frutescens Giganteum*.)

This is one of the best Californian novelties of recent introduction, and is truly a giant in size and in every way superior to all the older varieties now in cultivation. The habit of the plant is very compact and symmetrical. The individual flowers are gigantic in size, measuring fully  $4\frac{1}{2}$  inches in diameter. The petals are of good substance and are arranged in two rows around a bright yellow center. It is a very free flowering variety and the flowers last a long time in perfection. Was awarded a first class certificate by the New Jersey Floricultural Society, November 10, 1896. (Fig. 35.)

*From the Catalogue of Garrett & Rose, Jersey City, N. J.*

## Double White Fringed Poppy.

This splendid flower is the outcome of the labors of an enthusiastic flower lover who has been skillfully and patiently at work on it for years. Starting with the old Double White Carnation Poppy, he has increased the number and length of the petals and their purity of color, at the same time diminishing their width until he has produced an immense, dazzling white flower, so double and yet so finely divided that it resembles a ball of silk floss. It is rare to find a plant coming so absolutely free from variation as this does, and it is evident that there has been great care used in its development. It is a most distinct and evident improvement on any form of Carnation Poppy in cultivation, and will be welcomed by all flower lovers. (Fig. 37.)

*Introduced by D. M. Ferry & Co., Detroit, Mich.*

## Rudbeckia Golden Glow.

This is a form of *Rudbeckia laciniata* with perfectly double flowers from 3 to 4 inches in diameter and of a rich golden-yellow color. The plant is a hardy herbaceous perennial, and once planted will continue to grow and bloom indefinitely without further attention. (Fig. 39.)

*From Catalogue of G. W. Childs, Floral Park, N. Y.*

## BIOTA AUREA NANA.

This is a seedling of *Biota semper aurea* and originated ten years ago in our grounds. The original plant measures only 36 inches in height, is of most perfect form, and surpasses all the other varieties of *Biota aurea* so far introduced. During Fall and Winter the foliage assumes a beautiful golden color, and in Summer is of bright green. It has also the merit of being perfectly hardy in the latitude of New York. Nothing is more desirable in the way of a dwarf conifer. It has also proven valuable as a pot plant. (Fig. 38.)

*From the Catalogue of P. J. Berckmans, Fruitland Nurseries, Augusta, Ga.*

## New Chrysanthemum-Flowered HELIANTHUS

The new chrysanthemum-flowered helianthus has an entirely different appearance from the old helianthus that has been so popular for many years as a garden plant; the blooms do not have that appearance of the common sunflower, the flowers opening from the center with a long narrow petal, similar to the chrysanthemum, and keeping this resemblance until fully opened. The petals are long enough to completely hide the small, green foliage on back of bloom, which makes it not unlike the "Lincoln chrysanthemum," only the color is a clear orange.

The photograph was taken of one plant grown from seed planted in May. This helianthus was awarded a certificate of merit by Massachusetts Horticultural Society. (Fig. 36, page 107.)

*From the Catalogue of W. W. Rawson, Boston, Mass.*

## Double, Large-Flowering CYCLAMEN.

Cyclamens are among the most beautiful Winter and Spring flowering plants for the window and greenhouse. Not only are the flowers of striking beauty, but the foliage is also highly ornamental. This new double-flowering strain is even more beautiful, each flower having usually eight to ten petals, often twelve to fifteen, which are more spreading than in single varieties. There is the same range of colors, crimson, pink, white, spotted, etc., and, like all double flowers, they remain much longer in perfection than singles, the season of blooming lasting fully three months. The strain is not yet quite fixed, but produces a sufficient proportion of doubles to justify us in offering it this season. (Fig. 40.)

*From the Catalogue of Peter Henderson & Co.*

## THE NEW BEGONIA VULCAN.

(This will be botanically known as *Begonia Semperflorens Atrococcineum*.)

This new variety originated at FORDHOOK FARM. It is a seedling of the well-known BEGONIA VERNON, which is so popular all over the world as the best variety for bedding on account of profusion of bloom, beautiful foliage, and hardy growth. The many good qualities of Vernon are intensified in the Vulcan, which might be called appropriately the new Scarlet Vernon Begonia. Planted side by side, the Vulcan is similar in growth and free-flowering character, while it completely eclipses the Vernon in the rich brilliancy of its flowers. Each plant is covered with flowers, which are of the most intense fiery scarlet color, even the stamens being tipped with bright red. The entire plant is so brilliant that our head-gardener says, "It looks like a mass of burning coals." BEGONIA VULCAN comes perfectly true from seed and stands the most intense heat of summer, growing vigorously, without wilting, even in hot weather. (Fig. 41.)

*From the Catalogue of W. Atlee Burpee & Co.*

## CHRYSANTHEMUM Miss Lottie D. Berry.

This variety was certificated under the name of Garret A. Hobart. It is a large, pure white incurved Japanese; very full and double, borne on a good, strong, stiff stem, well furnished with foliage up to the flower; blooms in mid season, and is a first-class keeper. It secured the certificate of the Chrysanthemum Society of America, November 7, 1896. Our illustration shows the character and symmetry of the flower to perfection. (Fig. 42.)

*From Catalogue of Pitcher & Manda, Inc.,  
Short Hills, N. J.*

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1894.

PUBLISHED BY

A. T. DELAMARE Ptg. & Pub. Co. Ltd.  
ROSE AND DUANE BLDG.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1697.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**The Apple** THE apple is the most highly esteemed of all Down South. fruits. Those who have enjoyed early life on the farm cannot forget the old apple trees that were a part of the home. We remember every tree in the orchard, but most vividly those that stood near the house. How we admired them in the spring time, when the flowers, with petals of delicate pink and white, almost covered the branches. It was in their crotches, too, that the robins made homes and reared broods of little fellows which we watched with peculiar interest. When loaded with ripe fruit the trees had special attractions to the occupants of the farm. They were not only objects of beauty, but who can describe the feeling of satisfaction and contentment that took possession of one when, with a keen appetite, he visited the favorite tree, plucked a handsome specimen and enjoyed its delicious flavor! And our minds are filled with pleasant memories of the long winter evenings spent before a cheerful fire in the happy farm home, with basket after basket of luscious red apples from the well-stored cellar.

What fruit is more useful than the apple? How could we get along without it? Apples in their natural state, apples stewed, apples baked, apple jelly, apple pies, apple marmalade, apple butter, apple cider, apple vinegar, are among the var-

ious culinary uses of this fruit. And yet there are farms which do not produce enough apples for home consumption. Not long since a prominent agricultural writer advocated that it was better and cheaper for the general farmer to buy the fruit necessary for his family. This plan is absurd to people who are accustomed to growing all the fruit they want in the home garden and orchard.

But does it pay to grow apples for market? is a question that a great many people are now asking. That depends on the locality and the man behind the business. We would not recommend the extensive cultivation of apples in all sections of the South. We would not advise a man to engage in this enterprise who has already proven his inability and lack of energy in caring for the family orchard. If his trees are sickly, thick-topped, unsymmetrical in form, and full of dead limbs, while the soil is badly infested with weeds and briars, it is safe to conclude that such a person would not make a success of orcharding. If, on the other hand, he carefully cultivates, prunes, fertilizes, and sprays the few trees he may have, resulting in a good yield of fruit, this person would be running no risk in setting a large orchard for commercial purposes, provided good judgment is used in the selection of varieties, and business tact and skill in the sale of the fruit.

There are many paying apple orchards in the South. We know of some that yield handsome returns. A general collection of summer, fall, and winter sorts is grown to supply the local demands, and summer apples for shipping north. Hundreds of new orchards have been established in the more mountainous sections during the past few years. If these plantations receive the proper care they will doubtless prove remunerative.

## Garden Tools.

This, being the winter of our discontent, is a most opportune time to overhaul our tools before the busy season opens. In my experience during the last few years I find the quality of the tools now made inferior in material, although improved in form, as compared with those of a decade ago. The average steel spade of to-day is more generally soft, easily bent and wears dull. The spades of twenty years ago were better; usually the face was made of hardened steel, the back was made of soft iron, and as the latter wore away from the steel facing the more the tool was used the sharper it became. It was a delight to work with such a tool. Do we not to-day find grass sickles made of tin or soft iron? Many will not hold any edge at all. Pruning knives used to be made of well tempered steel that would hold a good edge for a considerable time, an important matter in many operations of the garden. Most of those now made are soft and useless, though expensive enough, but the "stuff" is not in them.

I see no reason why the verge edging knife should have the crescent shape on both edges. It is right

enough for the cutting edge, but it is often necessary in edging tough or dry sod to press it down with the foot, and there being no foot rest, or even a straight edge, the only thing that can be done is to press the foot on the inside curve, and hack our souls (soles) in the bargain. We have no power whatever on the tool, the handle being made only of a straight stick. I wonder why some are not made with a cross or box handle, similar to that of a short handled fork.

For opening drills and hoeing small stuff, as onions, lettuce, I have always preferred the triangular shaped hoe. It has three corners and as many edges. With one of the corners we can most effectually hoe up the weeds on a gravel walk. Yet we seldom see such a hoe used. I could not buy one last year. It is a useful tool, and if its merits were known it would become popular.

Now let us take such tools as grass edging, lopping and clipping shears, hoes, iron rakes. In dry weather the handles will drop off even if soaked in water. I see no reason why a small rivet could not be put in when the article is made to save the worker trotting off to the blacksmith's shop when busy, thus causing waste of time and vexatious delays.

A year ago we had some brush and roots to dig up. To facilitate the work we bought two grub hoes that were, from all appearances, strong enough to grub up oak trees. They might just as well have been made of pewter. They were so weak and poor that, although costing \$1.25 each, we did not get twenty-five cents' worth of work from them. They were made by a New England firm, and I consider to place such tools on the market is fraudulent.

Tools are not purchased to look at, but to do work. Inferior or badly tempered tools are dear at any price. Are the best methods of tempering a lost art? It being the duty of the gardener in the matter of tools, as well as many other items, to guard the interests of his employer, he will, therefore, for future reference make a note of any inferior tools that may have been purchased. W. M. EDWARDS, R. I.

L. E. Bailey, the well known professor of horticulture at Cornell University, has possibly done as much as any man to attract general attention to scientific horticulture. It is with pleasure we learn that the trustees of the Veitch Memorial, of London, England, have this year awarded Prof. Bailey one of their silver medals for distinguished services to horticulture "in recognition of his efforts by means of his lectures and his writings, to place the cultivation of plants on a scientific basis; to promote the extension of horticultural education, and by numerous trials and experiments, to improve and render more productive, plants grown for economic purposes."

The Veitch Memorial is a fund raised by popular subscription to the memory of J. G. Veitch, the celebrated plantsman, of London, who was instrumental in introducing many valuable plants into commerce. For some years after its foundation, the fund was used in giving medals for various competitions at horticultural exhibitions of prominent Societies, which practice is still indulged to some degree. This medal is of bronze. A few years ago, the trustees decided upon the course of annually presenting large silver medals to one or more men who, by their labors, had rendered signal services to practical horticulture. Mr. A. F. Barron, then of the Royal Horticultural Society, was selected as the first recipient of the award, *ex honoris causa*, which now, we believe, comes to America for the second time. Professor Sargent, of the Arnold Arboretum, having received the medal last year.

## Western New York Fruit Growers in Council.

(Continued from page 90.)

### Pruning Peach Trees.

The discussion on pruning peaches did not bring out anything new or startling save Mr. J. S. Woodward's warning against the scheme of an Ohio nursery firm which is canvassing portions of New York State for the sale of peach trees, offering to do the pruning for a year or two, with the guarantee that trees thus pruned by them will be absolutely safe from the attacks of the yellows. He states that no system of pruning is a protection against the disease.

### Canker Worm.

Professor Lowe of Geneva Station stated that much injury had been done in many orchards by the canker worm; some orchards had been almost ruined. Spraying had been delayed too long and should have been commenced quite early in the season. Paris green and lime is recommended. The addition of the lime makes the poison spread better over the surface and adhere more closely to the leaf. Some samples of Paris green were found to be badly adulterated even to as high as 40 per cent. Professor Jordan again offers to analyze samples free of cost for any one in the State who may send them to the station. The ammonia test, however, is simple and safe, and can be made by any one who uses Paris green. The unadulterated green dissolves perfectly in strong ammonia. The earthy matter usually selected for an adulterant remains as setthings.

### Embellishing Home Grounds.

Mr. E. A. Long spoke of the great quantity of embellishing material, consisting of native growths, by the hundreds and thousands. The causes of barrenness of many homes in ornamental growths which might make them spots of beauty are, firstly, lack of knowledge of the embellishing material suitable for the climate and soil, and, secondly, cost. A large number of shrubs and trees, hardy at the north and of easy culture, is available at a minimum cost. (Perhaps Mr. Long will give the lists in full.) Treat these as you would potatoes; dig around them, hoe and weed them, etc. You want two main features, the lawn and the beds. The beds are tilled; the rest is lawn. But first convert the whole ground into a lawn. Then cut the beds into the lawn, making a well-defined edge and the bed slightly rounded.

### Insects Injurious to Nursery Stock.

Victor H. Lowe spoke about three important insects injurious to nursery stock, namely, the peach tree borer, the woolly aphis of the apple and the San Jose scale. The way to deal with the peach borer is to dig it out when it first appears in spring, and trees should be watched at that time for the purpose; for the two other insects the trees should be pruned where branches interlace and be then thoroughly sprayed with strong kerosene emulsion.

### Experiments with Fertilizers.

Dr. Caldwell, the chemist of Cornell University, stated that few experiments in this line are recorded. As a source of nitrogen, nitrate of soda is one of the cheapest, and is very quick acting. It should be used more in this country, and will be when growers learn to make their own mixtures. Oil meal, at present prices, is also a good and cheap form in which to apply nitrogen. He gives the following formulae:

#### For light soils

1,000 lbs. basic slag.  
500 lbs. kainit.  
1,000 lbs. oil meal.

#### For heavy soils

1,000 lbs. acid phosphate.  
180 lbs. muriate of potash.  
1,000 lbs. oil meal.

Two entirely new ideas in applying fertilizers to fruit trees were mentioned. One is to dig out a wide trench, ten inches deep, around each tree, mix the fertilizers with a portion of the soil, throw this mixture back into the trench, and then fill up with the other part of the soil thrown out. By this method the plant food is put just where it is most desirable to have root develop and feed. The other idea, although on first sight it may remind one

of a humbug much mentioned a dozen years ago, may yet open up new possibilities in feeding trees. A little above the surface of the ground a hole, 1½ to 2 inches through, is bored into the body of the tree and about two-thirds through, slanting downward at an angle of about 45 degrees. Through this opening the tree is fed with a substitute for plant sap, prepared by dissolving nitrogen, phosphoric acid, potash, iron, etc., in proper proportions. Dr. Caldwell says he can see no chemical obstacle to this plan, although there may be physiological reasons for its non-operation.

In the discussion following Dr. Caldwell's address Professor Jordan spoke in favor of the home mixing of fertilizers. Cultivators are using what manufacturers are putting in their hands. The manufacturers do not know any more what you and your particular soils need than the man in the moon. Progress must come through home study. As a source of nitrogen cotton seed meal is cheap. The nitrogen in it only costs 12 or 13 cents a pound. Nitrate of soda is good for a portion of the nitrogen needed. Fruit growers have paid manufacturers 17 cents a pound for nitrogen, 5 to 6 cents a pound for potash, and 6 to 8 cents a pound for phosphoric acid.

In response to Mr. Willard's question about the availability of basic slag, Dr. Caldwell says it is a somewhat uncertain quantity, because it has not yet come into general use in this country, while large quantities are used in Europe.

Professor Clinton of Cornell tells of a crop of crimson clover, sowed Aug. 1, which by Nov. 3 had made \$18 worth of nitrogen per acre, figured on the basis of 12 cents per pound for organic nitrogen. On hard clay, or dry knolls, where crimson clover will not thrive, he would first sow rye and plough this under. The clover would then grow all right. Professor Beach (Geneva Station) says he loosens up the ground by sowing a mixture of Canada peas and buckwheat, while Professor Roberts recommends barley and peas for the same purpose.

### Trimming Standard Pear Trees.

Mr. C. M. Hooker's way of trimming standard pear trees is to let them grow pretty freely, heading say three or four feet high, thus making them half standards every year. During winter very strong or excessive growth is cut back about one-half. W. C. Barry is in favor of rather severe pruning. The fruit spurs are often too numerous. It is just as bad to have too heavy a yield as to have one too small. What we want is the proper amount every year. This we can secure by proper pruning. He promises to give an object lesson in pruning for next year's meeting. Winter Nells is inclined to overbear and to bring small pears. By proper pruning large specimens can be secured.

### Five Best Pears for Fall and Winter.

Mr. Hooker named the following four as his choice: Bartlett, which always stands at the head; Duchesse, Anjou and Clairgeau. For the fifth he thinks there are many of equal value from which to select. Members present named Lawrence, Bosc, Louise Bonne de Jersey and others. Lawrence and Clairgeau should always be well headed back. On direct request Mr. S. D. Willard gave his opinion of the Kieffer. He stated that we plant for money, not for taste, and more money has been made per barrel from the Kieffer than from any other pear. But it seems we have now come to the point where we are going to have more Kieffer pears than the world wants, and he would not advise any one to plant largely of that any more. He has never heard of the San Jose scale touching a Kieffer.

### Thinning Apples.

Professor Beach, of the Geneva station, says we now begin to fear superabundance of apples more than we do insects' attacks. Severe thinning in 1896 would have increased the crop of A No. 1 fruit, decreased the proportion of inferior apples, relieved the trees, and left them vigorous enough to produce fruit buds for next season. In experiments made last season at the station three methods were tested. The first one consisted of the simple removal of inferior fruit; the second, in addition to this, the thinning of the remain-

ing specimens to a uniform distance of four inches; the third, in leaving the good specimens, after the removal of the inferior ones, six inches apart. Baldwins, thinned after the first method, gave 16 per cent. less apples, but 10 per cent. more A No. 1 fruit; Baldwins, thinned to four inches apart, gave 26 per cent. less fruit, but 22 per cent. more A No. 1, and Hubbardstones, thinned to six inches apart, gave 25 per cent. less fruit, but 17 per cent. more A No. 1. Greenings set a fair crop only and needed no thinning. One tree, from which all the inferior specimens were removed, gave 6 per cent. more fruit altogether, and 10 per cent. more A No. 1 fruit. All grades of fruit were thinned were decidedly superior in size and color. The color does not depend alone on the amount of sunlight, but to a large extent on the amount of the available food.

The second method of thinning seems superior to the first, and to pay well for the difference in labor. If we thin at all we should make a good job of it. The chief objection to thinning is the expense of the operation, when apples are so low in price. But the methods often recommended, as, for instance, that of thinning with a garden rake (by Green), or shaking and clubbing off (by Greiner), are too crude. Where thinning is needed most is on the lower or under branches. This can be done while standing on the ground, or from step ladders, and at moderate expense. Mr. Beach says he is in favor of the practice, but the question is one for every fruit grower to decide in his particular case.

Mr. Willard mentions the results of judicious thinning, as (1) improvement in color; (2) in quality; (3) probability of an other crop in sight, at least on trees which had the fruit thinned to six inches apart. By thinning we have disposed of the excessive tax upon the vitality of the tree and curtailed excessive seed production. There is a positive gain in four lines which makes the question one worthy of consideration. We would have improved our chances of profit if we had removed the whole crop off one-half the trees and one-half the crop off the other half of the trees.

Mr. Collamer says he has practiced thinning apples right along and it has paid him every time. The cost is less than the gain in good apples.

Professor Roberts considers the question practically settled by California experience. A Chinaman thins the peaches on ten trees per day and receives \$1 for the job. The increased price of one barrel of apples or one basket of peaches will pay for thinning the fruit on the ten trees.

### Election of Officers.

The officers for 1897 were elected in the usual informal way by committee and ballot cast by the secretary. They were almost without exception re-elections as follows: President, W. C. Barry, Rochester; vice-presidents, S. D. Willard, Geneva; George A. Sweet, Dansville, Irving R. Smith, Syracuse, and Claudius Hoag, Lockport; secretary and treasurer, John Hall, Rochester; Executive Committee, C. M. Hooker, Rochester; C. W. Stewart, Newark; Nelson Bogueau, Batavia; E. A. Powell, Syracuse, and H. S. Wiley, Cayuga.

Committee on Native Fruits—W. C. Barry, Rochester; Prof. L. H. Bailey, Ithaca; E. A. Bronson, Geneva, J. S. Woodward, Lockport, L. Woolverton, Grimsby, Ont.

Committee on Foreign Fruits—George Ellwanger, Rochester, J. H. Babcock, Lockport, John Charlton, Rochester, W. P. Rupert, Seneca, George H. Moody, Lockport.

Committee on Nomenclature—W. C. Barry, Rochester, S. D. Willard, Geneva, D. Bogue, Medina, S. A. Beach, Geneva.

Committee on Ornamental Trees and Shrubs—George H. Ellwanger, Rochester, George G. Atwood, Geneva, Irving Rouse, Charles Little, Robert Ades, Rochester.

Committee on Entomology—M. V. Slingerland, Ithaca, C. M. Hooker, Rochester, J. F. Rose, South Byron, R. C. Hewson, Penn Yan, C. H. Stewart, Newark.

Committee on Garden Vegetables—C. H. Perkins, Newark, Abram Frank, Irondequoit, Prof. W. H. Jordan, Geneva, M. V. Slingerland, Ithaca.

### Pedigree Strawberry Plants.

Pedigree plants or animals are those having a known line of ancestry—presumably good ancestry.

New varieties of strawberries originate from seed sown by man or nature. A variety thus originated propagates itself by means of runners which grow out from an old plant, take root and form young plants. A pedigree strawberry plant, as I use the term, means usually, but not always, one of the above kinds (for the ancestry of some of the best varieties is not known), which has been still further improved by repeatedly selecting plants noted for general excellence as fruit bearers, from whose runners young plants are obtained to set all new fields.

From these young plants, the most excellent ones, are again in fruiting time selected the most excellent ones, and so on indefinitely. But the berries should not be allowed to remain on these plants an hour longer than is necessary to prove the fruitfulness and general excellence of the plant. The berries should always be pulled off before they ripen or the seeds mature, which is the process so exhausting to the plant.

It is denied that this selection does any good at all, and asserted that one plant of any given variety is just as good as any other plant of that variety. That the assertion is erroneous, I know from actual and repeated tests. I have long followed this plan of selection, and proven that it does tell strongly in the improvement of a variety, provided of course that it is intelligently and persistently carried out. In fact improvement in plant or animal can come in no other way. To assert that all strawberry plant of any given variety are equally good, no matter how the one may have been allowed to run down by neglect, or the other bred up by careful selection and high culture, is an error, and an error of a very harmful kind. It is as erroneous as to hold that one herd or strain of Jersey cows is as good as any other herd or strain, although one might have been highly and judiciously fed and bred from only the best cows, and the other herd or strain had been starved and bred from scrubs for twenty generations.

The fact is that all varieties of strawberry plants as soon as originated begin a gradual process of change. It may be slow, but it is sure, and almost inevitably tends to deterioration.

My plan is to arrest, and even to some extent reverse, this process of deterioration by raising young plants from old plants of conspicuous merit. O. W. BLACKNALL.

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

Worden grape is taking the place of the Concord in many places.

It is evident that plants have peculiarities similar to those of animals.

A well pruned and well cared for peach orchard is a beauty to behold.

Do not plant the blackberry on soil which cannot be thoroughly drained.

London and Miller's Red Raspberry.—I should like to hear the experience of some of the readers of American Gardening with these.

Chicory can be grown on a small scale and the dried roots mixed with coffee.

Mulch the Quince.—It is said that it is not the top, but the root of the quince which is the most tender; hence the necessity of a heavy mulch around the trees.

Novelties.—No money consideration should induce a grower to introduce a variety of small fruit which is not in some point superior to varieties already grown.

Peach Borers.—Some one thinks the borer is less liable to attack vigorous trees. Is it not a fact that most insects attack trees which make a feeble growth sooner than those of strong vitality?

Making Boxes, Etc.—We will have more time to make berry boxes, crates and packages now than later on. One grower makes his boxes in winter, cleans out the divisions in his granary and puts up in neat layers as many thousands as he wants to use at picking time. He thus never gets short of boxes, as he figures on making up enough to have some left over for another year.

Roses can be bought so reasonably now; why not order a dozen assorted varieties and make the children a present of them for their flower garden?

Evaporators.—Every fruit grower should have an evaporator to dispose of his surplus fruit.

Wood Ashes for Berries.—Now is a good time to haul on ashes and scatter them over the ground where the new strawberry patch is to be set; provided the surface is level. If hilly wait till spring, when the ashes can be worked in by the cultivator.

Habit Is Strong.—We might as well get in the way of doing our garden work promptly, neatly and thoroughly as to be slack with it.

Gooseberries should be trimmed so that air and sunshine can get among the branches. It is a mistake to let them fill up with wood and cause a dark shade which will be a harbor for insects and an invitation for the mildew to step in.

Early Pollenizer.—I used to like Jessie strawberry for fertilizing pistillate varieties, but the spring frost is about sure to blast most of its blossoms; hence others more hardy take its place.

Victoria Currant.—One reason why this keeps its fruit looking so nice for a considerable length of time is that its foliage stays on longer than that of some other varieties, and so protects the fruit from sunscald.

Salt for Radishes.—One of my neighbors says the way he grows such crisp radishes and keeps them so free from worms is, he sows salt, and plenty of it, over the ground after it is prepared for sowing them, sows broadcast, rakes in and lets the plants take care of themselves until time to market.

Lucretia Dewberry.—One of the catalogues in describing this says it is as hardy as the Snyder Blackberry. I am inclined to think the author put it a little too strong. The Lucretia Dewberry proves to be more tender than Snyder, but is desirable because it can easily be protected.

New Strawberry Culture.—I am anxious to try the new method of growing strawberries recommended by L. J. Farmer. I doubt its being very practical, but will sport its real merits as soon as thoroughly tested.

C. C. NASH.

When the army worm appeared last summer, *The Rural New-Yorker* readers were promptly told all about it, and they saved their crops by knowing how to fight them; you may want to know how to fight some other pest next year. It will tell you. We can send it and AMERICAN GARDENING both one year for \$1.80 and your money back in three months for *The Rural*, if you want it. Address *The Rural New-Yorker*, New York, for free sample copy.

FOR \$4 we will send *Leslie's Weekly* (formerly *Frank Leslie's Illustrated Weekly*) and AMERICAN GARDENING to any address, one year. *Leslie's* is one of the most attractive of New York's numerous illustrated weeklies, and its subscription price alone is \$4 a year; therefore, it will be seen that our offer is a very liberal one. Address your orders to AMERICAN GARDENING. Sample copies of *Leslie's* on application.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### Value of Fancy Fowls.

The question as to what is a fair value to place on a thoroughbred fowl is one that is oft recurring. Often the seller doesn't know, especially if he be a newly fledged fancier. Still oftener is the buyer at sea. He knows that he wants good birds, but he does not know good birds, perhaps, when he sees them. If the fowls have been reliably scored a recognized scale of values may be applied to them. In good hands 85 to 88 point birds are classed as culls. Those showing 90 to 92 points may run from \$2 to \$10 each, according to breed and sex. Ninety-four point birds may bring from \$6 to \$15, if the owner knows how to work them off. Above 94 points it is a matter of how strong is the desire of the few buyers who can pay the price. A little more than a year ago \$50 and \$75 was repeatedly refused for one of the first prize winners at New York.

### Snow as Poultry Food.

Inquiry is often made as to whether snow when taken into the crop is injurious to the fowls. We do not need to be told that extremely cold substances taken into the human stomach chill the whole system. Given exposure added and fatal results may supervene. Reasoning from analogy, and knowing that fowls are peculiarly susceptible to the effects of chilling, how can we come to any other conclusion than that they are decidedly better off without snow and ice, particularly as a diet?

### A Unique Forget-Me-Not.

An apparently revolutionary plant among the varieties of *Myosotis* appears this season under the subtitle of *rosea stricta*. As pictured, the plant is nearly cylindrical, strictly upright in growth, entirely innocent of anything that might be called grace, but thickly covered with bloom; it is called a plant of striking beauty. Quite as much of an advance, perhaps, but in another direction, is the new sort known as *Distinction*, which, unlike other forms of the Alpine sorts, blooms the first season from seed. It is said to force well, and to bloom all winter after having done duty on the veranda during the summer. Do not amateurs generally leave the forget-me-not too much to the garden?

### Twiners and Trailers.

It is not too soon to be thinking of material for the veranda baskets and boxes, especially if these are to be raised from seed. Among the dependable things are *Petunias*, *Verbenas*, *Thunbergias*, *Lobellias* and *Nasturtiums*. To these may be added the *Kenilworth ivy*, *Lantana*, *Torenia*, and for shaded places *Mimulus*. All these may be raised from seed, but they must be started early if they are to be satisfactory. Most of them come from cuttings also. The *Lantana* is an especially good plant for outdoor work, where it is too seldom seen. A new sort, having an unusual disposition to trail, which is now offered, may prove helpful toward bringing this plant into recognition as a subject for baskets and veranda boxes.

### Blooming an Amaryllis.

It is possible that those who may have berated themselves on account of the ill behavior of some precious amaryllis may not be so wholly to blame as they have thought. Very often the bulbs sold are barely of blooming elze, and they cannot always be called well ripened. If a properly ripened bulb has the bud formed within its circling walls it must be very bad treatment indeed, from which it will emerge failing to bloom. As a sample of the rapidity and sureness with which these bulbs come into bloom, it may be noted that a Johnsoni bought from the dealer and potted during the second week in December was in full bloom on Jan. 23. Of course, the bud was all ready to push at the time of potting.

## Naked Pills

are fit only, for naked savages. Clothes are the marks of civilization—in pills as well as people. A good coat does not make a good pill, any more than good clothes make a good man. But as sure as you'd look on a clothesless man as a mad one, you may look on a coatless pill as a bad one. After fifty years of test no pills stand higher than

**AYER'S  
Cathartic Pills**  
SUGAR COATED.

### The Best Fern.

That beautiful fern called *Adiantum Farleyense* is often referred to as the queen of maiden-hairs. When at its best, words cannot adequately describe its beauty. But it needs more heat than many who essay its culture realize. A newer form, known as *Adiantum Capillus-veneris imbricatum*, is sometimes, but of course wrongly, called the hardy *Farleyense*. It seems to be worth attention and trial by those who may not have succeeded with the older form.

### Protect from Dampness.

Among all the conditions of which we must say "Shield the fowls absolutely from these if you wish them to prosper," none demands more emphasis than this; for it is a fact to which those long in the work bear universal testimony—that dampness alone may nullify all other attention that may be lavished on the birds subjected to it. It is, too, one of the most difficult things to overcome wholly. Tightly closed houses and earth floors tend always in the fatal direction. Conversely, dry raised floors and daily fresh air with sunshine are always helpful.

### Lime and Poultry Droppings.

On page 42 was a paragraph on this subject, and a comment from a reader brings out a fact often noticed, viz., that one is almost sure to say too much, or too little. If the conservative note on page 42 be carefully scanned, it will be seen that neither lime nor land plaster was recommended. This was simply for the reason that the writer neither believes in nor advocates their use. Science, speaking usually through the mouths of the large number who read the various poultry papers, but do little thinking or observing for themselves, may say that lime frees the ammonia from the droppings, while gypsum fixes it. Yet there are many who find by experience that lime is a good thing in the poultry house; and one of our best poultry papers says, editorially, that in six years' use of lime no odor has ever been noticeable in the houses; if there were escaping ammonia this could not be true. Those who are pronounced in favor of lime are careful to say that they use it in the air-slaked form. Possibly others may not have done this. It is not an easy matter to stand up in opposition to the whole army of poultry experts, especially when they believe themselves to be backed by science, but for ourselves, we have no good word for gypsum. The ill-odor in our fowl houses has never been so pronounced as when using gypsum as a supposed deodorizer! In using coal ashes on the platforms we dispose of a waste product with one handling, in a way to make it of present and future value. This we consider the essence of good gardening, or, indeed, of good business generally, where there is waste to handle.

MYRA V. NORRIS.

## WHOLESALE MARKET REPORT

## New York.

The demand in the cut flower market fell away in a most disastrous manner during the latter part of last week and prices ruled very low. It is expected that the Bradley-Martin ball and other social functions this week will change the conditions and make the averages of this week much higher.

The market in fruits and vegetables generally is much firmer and stock of all kinds is moving in favor of the producer. This is as we predicted last week. The frost in Florida has wiped out the greater part of the fall plantings, and what stock is coming in now is from the extreme South, and the quantities are not sufficiently large to largely influence the market.

Asparagus is arriving regularly, but quality is poor.

Hot house lettuce is, generally speaking, so poor just now that select Florida is over-selling it. Quantities have to be sold at from \$1 to \$2 per barrel, with extra fancy at 75 cents per doz., as top notch, while select Floridas are making as high as \$2.50 to \$3.50 per half basket.

Radishes have slackened up in price; what were quoted at \$4 per 100 bunches are now selling \$2.50 and \$3.

Cucumbers, fancy stock, are still making \$2 and \$2.50 per dozen.

Mushrooms are still hanging fire and a clearance has not yet been effected; but it is hoped that this week will about see the end of the surplus, after which the market will get back to a more normal condition.

Some very fine cauliflowers are coming in from Long Island growers. These are selling from \$6 to \$8 per barrel for fancy, and \$2 to \$3 for seconds.

Hot house strawberries have improved in price and are again back to \$4.50 per quart.

Hot house grapes (European) \$1.25 to \$1.50 per lb.; domestic grapes, N. Y. Catawba fancy, per 4 pound basket, 12 cents to 15 cents per pound; second, or inferior, 8 cents to 10 cents per pound.

Apples are steady at last week's quotations. The receipts and exports for the week ending Feb. 6 were as follows:

Receipts for week.....	27,660
Receipts since Sept. 1.....	1,032,948
Receipts same time last year.....	566,884
Exports for week.....	7,939
Exports since Sept. 1.....	498,630
Exports same time last year.....	244,708

Ginseng.

Prime dry root is in moderate supply, and steady at \$2.75 to \$3.75 per pound.

Apples.

## Philadelphia.

There has been a wonderful improvement in this market during the latter part of last week and the early part of this week and all kinds of stock have been moving more readily.

That the cold snap has not extended so far South as was anticipated is evident from the arrival of Florida vegetables during the past few days; the weather has also been milder here, and all kinds of vegetables have been in demand.

Prices are much firmer; apples have advanced and many are still held at higher figures than quoted here; selling prices have been:

Spitzenburg, fancy.....	2 25@2 50
Kings, fancy.....	2 00@2 25
Baldwins, fancy.....	1 60@1 75
Baldwins, fair to good.....	1 30@1 50
Greenings.....	1 40@1 60

Strawberries have fallen off very much; those arriving are mostly of inferior quality and go to the street men. Good fruit has been

selling at \$1.00 per qt. The general opinion is that no quantity of good fruit will arrive from Florida for five or six weeks yet.

Mushrooms have sold better and remain firm at 20 to 25c. per lb.

Hothouse tomatoes continue in fair supply and of fair quality; color not quite so good as last week; these bring 25 to 30c. per lb.

## Vegetables.

Beets, Florida, new, per 100 bunches.....	4 00@6 00
Brussels Sprouts, per qt.....	75@ 10
Cabbages, new, Florida, per crate.....	2 50@3 00
Cauliflowers, per basket, Florida.....	1 50@2 00
Celery, extra, per doz. stalks.....	50@ 75
Kale, Norfolk.....	75@1 00
Lettuce, Florida, per 1/2 basket.....	1 50@2 50
Spinach.....	1 50@2 00
Tomatoes, Florida, fancy.....	2 50@3 00
Tomatoes, Florida, fair.....	1 50@2 00

Onions have moved much better; the best seller has been Yellow Globe Danvers, N. Y. stock; these sold at \$3.00@3.50. White are not so plentiful, and average \$4.50@6.00. Red are rather scarce this week; they have sold at from 3.25 to 4.00. There are very few Western onions to be seen.

There were no peas or string beans to be found on the market this week, and hothouse vegetables are very scarce. The lettuce now arriving from Florida is very good, and but few baskets remain unsold. Cabbage is the only vegetable that is not selling freely.

## Catalogues Received.

**PHOTO**, 5x7, of celery with paper tubes on and two girls who grew it. First at State and County Fair. You big men make a great fuss about growing celery. Try of information 10 cents. Richard Branson, Syracuse, N. Y.

**PRIVATE GARDENERS.****Honor to Whom Due.**

On page 77 your correspondent, Mr. Napier, alludes to having charge of the house of grapes in Polmont, Scotland. I say, give credit to whom credit is due; I have known Mr. Murray, superintendent gardener at Park Hall, Polmont, for years, and it is but little over two years since I last met him. Mr. Murray is a famed grape grower, and while Mr. Napier or another might have been his foreman, he never had entire charge. When I was a bit younger I was foreman under gardeners when they came to the front in producing first class grapes, but it was not I that deserved the credit. D. MURDOCH, Marlon, Mass.

**Poughkeepsie, N. Y.**

The Dutchess County Horticultural Society met in the Court House Thursday, Feb. 4. There was a large attendance. The following committee was appointed to take in charge the arrangements for the next exhibition: James Blair, W. G. Gomer-sall, Harold Cottam, Thomas Harrison, Peter Devoy, James Sloan and I. L. Powell. An appropriation of \$50 was made to secure the services of essayists when considered advisable. William J. Stewart, of Boston, was elected an honorary member of the society.

I. L. Powell, of Millbrook, N. Y., read an excellent paper on "Herbaceous Plants." The society now numbers 97 members, and has about \$500 in the treasury.

In the evening the second annual dinner was held in the Nelson House. The tables were elaborately decorated, conspicuous among the flowers being three baskets of orchids from Thomas Emerson (the center basket of Cattleya blooms was, owing to the excellence of the varieties, perhaps one of the grandest ever put on a dinner table), and a large bunch of Lily Dean carnation from J. N. May, of Summit, N. J.

P. O'Mara, of New York, acted as toastmaster in his usual able manner. President George Siltford replied for "Our Society," mentioning the phenomenal growth of the association during the short period of its existence, since January, 1895. "The Horticultural Press" was responded to by James Withers, of the American Gardening, who explained the relation of the press to the trade and their mutual helpfulness.

**Situations Wanted.**

Advertisements will be inserted under this heading at ONE CENT per word each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

**GARDENER**, a German man, married, 30 years old would like to take care of a gentleman's private place. Best of references. Address C. A. care of American Gardening.

**GARDENER** and Florist, 30 years of age, single, German, 15 years' experience, wishes to take charge of gentleman's place, first-class references. Address L. D., care American Gardening.

**BY** women, each with an infant or young child, situations in the country (general housework, plain cooking, etc.) in New York and adjacent States. Small wages expected. Railroad fare paid by Association. Apply State Charities Aid Association, 105 East Twenty-second St., New York City.

**GARDENER and Florist's** assistant, English, 35 years of age, single, 3 years' experience at florist work, also years at kitchen garden, understands growing vegetables in greenhouse, good references, desires situation with florist or market gardener near New York. Address A, care American Gardening.

**HEAD GARDENERS**.—We have constantly on hand Gardeners of all kinds, single and married—men competent to take charge of graperies, greenhouses, vegetable gardens, lawns, roads, and the usual work pertaining to their profession. Correspondence solicited. Peter Henderson & Co., 35 & 37 Cortlandt St., New York.

**SITUATION** wanted.—First-class Gardener with diploma from both sides of the Atlantic, will guarantee financial success in producing choicest roses, also mushrooms under glass, in same building, and heat, thereby saving expense in labor, space and fuel; forcing vegetables under glass and European grapes specialties; thorough artist at table decorations; good landscape gardener; best city references. Wm. Thompson, 741 First Ave., N. Y. City.

**Boston, Mass.**

The chief exhibitor at the exhibition of the Massachusetts Horticultural Society on Jan. 30 was Oakes Ames (Carl Blomberg, gardener), who sent a handsome vase of Bride and Bridesmaid Roses, and smaller vases of Anna Olivier, Perle des Jardins and Lamarque Roses, a vase of twelve varieties of Cyprripediums, Odontoglossum Roezili alba and Cat'leya Trianae, also Mahernia glabrata; Clematis Mme. Lemoine, Chrysanthemum frutescens, Acacia pubescens, Antirrhinum majus, and Camellias. James Comley exhibited fine specimens of President Clark Camellia, a beautiful pink seedling Azalea and California Violets. William Wallace Lunt exhibited a seedling Cyprripedium bearing his name; it is a hybrid between C. insignis Maule and C. Boxalli stratum, originated by H. Low & Co., of London. P. E. Simpson (J. H. Hemingway, gardener) showed a plant of the Farquhar Violet.

**Lenox, Mass.**

The regular meeting of the Lenox Horticultural Society, held Feb. 6, was marked by a fine display of carnations, which included two new varieties, Mr. Hugh Graham's "Victor" and Mr. Cook's "Nivea," the former gaining a first class certificate and the latter "special mention." Mr. William Griffin exhibited well grown examples of Albertina, Scott, Emily Pierson and Brutus. For the collection he was awarded a first class certificate. Mr. A. H. Wingett exhibited some extra fine blooms of Bouton d'Or (first class certificate), and Mr. George H. Thompson showed a nice vase of Tidal Wave (diploma). Mr. A. J. Loveless showed Browallia, a very pretty, purple-flowered annual (first class certificate), and a well flowered spray of Desmodium Nobile (album). Mr. E. J. Norman read a paper on the history of orchids, treating chiefly upon the dates of introduction of the different species and of the early futile attempts at their cultivation; also telling something of the conditions under which they grow in their native countries.

At the meeting on Feb. 20 Rev. W. T. Hutchins, of Sweet Peas fame, will read an essay on "Sweet Peas."

**Private Gardeners' Mission.**

BY P. O'MARA.

(Continued from page 97.)

While on the subject of size I am reminded of reading recently in an old magazine the following: "It is a prevailing and most erroneous opinion that the enjoyments derivable from a garden are just in proportion to its magnitude. So far from this being the case, it may be said to be a fact that it would confer a most essential service to the science of gardening, either to lessen by one-half almost every ornamental garden, or allow double the amount of labor to that usually bestowed upon them. In ninety-nine gardens in every hundred it will be found that their extent is such, compared with the labor allowed for keeping, that the time and attention required for the nicer operations of the art are almost, if not wholly, absorbed in the manual labor demanded in keeping in repair the beds, grass, walks, etc. This ought not to be. The pleasures and enjoyments of a garden by no means depend on its extent, but on its high state of culture and keeping." This was written nearly fifty years ago in relation to American gardens and is applicable in a great measure to-day. Its incontrovertible truth and sound common sense appeal to the veriest tyro in the craft and it should be part of the gardener's mission to keep this before the minds of such employers as require to be reminded of it. You all know that no practical man should attempt more in horticulture than the labor allowed can cope with. Laudable ambition to do much with little is to be admired, but it rarely succeeds in horticulture, and if when occasion required it the gardener would take a firm stand, explain the situation to his employer in an intelligent, forcible manner much of the poor results from insufficient help would be avoided. The untrained eye—and the eyes of many proprietors are

untrained—may not be able to see wherein labor could be profitably employed, and where, if rendered necessary by circumstances, a saving in labor could be effected. It is here where the trained skill of the professional gardener should assert itself, and in ninety-nine cases out of a hundred, if the case is put in its proper light by him, he can improve the situation some, even if he is unable to have things done just as they should be.

A gentleman who owns a large place on the Hudson River and who has traveled abroad extensively once said to me that we were now about fifteen years behind Europe in gardening. I mention this to show what is the opinion of one who had evidently watched gardening on both continents. His own place is well kept, and in his immediate neighborhood are some fine estates. It was a broad statement, and like others of its kind opens up a wide field for discussion. It will be generally conceded by most men capable of judging that we are at least that much behind in some things and far more in many, while it would not be hard to select others where we are on equal terms if not ahead. With varying conditions of soil and climate every practical man knows that an exact comparison is impossible, but the question is rather should we remain under the influence of any country, or should we rather define our own orbit, accepting what is useful and rejecting what is unsuited to our conditions? The professional gardener above all others occupies the place in ornamental horticulture which enables him to decide this question. In our vast country, with professional gardeners scattered from the Atlantic to the Pacific and from Hudson Bay to the Gulf of Mexico, there should be keen eyes to select what is best adapted to meet varying conditions, and if varieties are not yet produced suitable to meet requirements he should use his skill to produce them. The native flora of the world has been pretty well explored, and now hybridization more than ever must be looked to for supplying new and improved forms. This is a fair field for the professional gardener, and it is his mission to test its resources. It is a field in which honor is to be found, wherein he may win imperishable laurels, wherein he has the opportunity to benefit himself peculiarly and confer a benefit on millions now and on untold millions yet to be. It is not a field that he should surrender to the commercial florist and nurseryman. It is, in fact, a field to which they invite and welcome him. He has already done much in it, but there remains yet much to be done. Let us take a glance at what the professional gardener has already done. I wish that I could give a complete list of contributions to American horticulture from this source, but reliable information is difficult to obtain, as I found from experience.

Full fifty years ago the Massachusetts Horticultural Society offered a prospective prize of a gold medal for the best seedling garden rose. The honor of winning that prize belongs to Mr. Michael Walsh, gardener to Jos. S. Fay, Esq., of Wood's Holl, Mass., who won it with his magnificent seedling introduced this year by Peter Henderson & Co. under the name of Jubilee. In this connection I do not think it amiss to say that the commercial florist or nurseryman who obtains a new variety from a gardener should give him due credit for raising it by announcing the fact in the published description. It is only fair and giving honor where honor is due. The carnations Lizzie McGowan and Louise Porch were raised by a gardener, Mr. Carl Schaeffer, then at Orange, N. J., now at Tuxedo Park, N. Y. Alexander MacPherson, then gardener to John Burke, Esq., raised the canna Nellie Bowden, which for a pure yellow, when viewed in a mass, was in its day considered good and is not without merit even yet. That grand nymphaea O'Mahana, raised by my friend Peter Bisset, gardener to Gardiner Greene Hubbard, Esq., Washington, D. C., and which he honored me by naming after me, is a variety of which he may well feel proud. John Fraser, of Baltimore, Md., contributed some fine seedling abutilons to horticulture. The coleus Golden Bedder, one of the best contributions to American horticulture, a "sport" from "The Shah," was raised by Richard Johnston, then gardener

to Mr. Bowie Dash, Kingsbridge, New York city, and introduced to commerce by Mr. F. R. Pierson, to whom I am indebted for full information concerning this still very useful plant. The coleus Mrs. D. I. Haight was raised by Mr. John Logan, Goheen, N. Y., gardener to the lady whose name it bears. The achyranthus Gilsonii was raised by a gardener whose name it bears, and who I am informed was a colored man. The purple salvia Mrs. Mitchell was raised by I. H. Slocum, New Haven, Conn., gardener to Hon. Charles Mitchell. The canna Mrs. Fairman Rogers was raised by Mr. James Cowles, and canna Robert Christy was raised by the gentleman whose name it bears, still gardener to J. Peabody Wetmore, Esq., Newport, R. I. Mr. Jackson Dawson, of the Arnold Arboretum, who may be classed among professional gardeners, has done yeoman service for American horticulture, not the least of which was the production of the now famous Dawson rose. To enumerate all he has done would make an interesting chapter in itself, if I had the material, but his work on Rosa Wichuriana and multiflora japonica should receive special praise. Mr. William Falconer, lately gardener to Charles A. Dana, Esq., Glen Cove, N. Y., has rendered inestimable service to American horticulture by developing many plants that would have otherwise remained in obscurity. His name is indelibly linked with the horticulture of this day, not alone by his practical work but also by his invaluable contributions to its literature. Mr. William Dogue, the public gardener of Boston, Mass., has raised some fine seedling coleus. In new chrysanthemums the gardener has played a prominent part. T. D. Hatfield, gardener to Mr. Walter Hunnewell, Wellesley, Mass., originated Lady Playfair, A. H. Fewkes, Walter Hunnewell, J. Pithers, Frank Hatfield, Elderdawn, Signal Light, Columbia, Mrs. T. D. Hatfield and Sundew. John Marshall, gardener to Mr. Trenor L. Park, Purchase, N. Y., received a certificate last fall for his fine chrysanthemum Mrs. Trenor L. Park. Wallace G. Gomersall, gardener to Professor Winthrop Sargent, Flatbush-on-Hudson, N. Y., raised good varieties in Wodene-the and Mrs. J. R. Van Duzer. Joseph Monahan, gardener to Mr. Charles Trotter, Germantown, Pa., received a certificate last fall for a chrysanthemum, Thomas Monahan, also for another new seedling, Miss Helen Trotter. His father, to whom he succeeded, raised some of our best varieties, including E. H. Fittler, Mrs. J. G. Whilldin, Black Beauty, Molly Bawn, Sugar Leaf, Mrs. W. H. Trotter, Goliath and El Dorado. James Brydon, gardener to Hon. John Simpkins, Yarmouth, Mass., has raised some fine chrysanthemums, and last year obtained a certificate for another, named Quito. Robert G. Carey, gardener to T. C. Price, Esq., Chestnut Hill, Philadelphia, Pa., the raiser of Liberty, Oakland and other fine varieties, received a certificate for his new seedling, Robert Edgerton, last year. Richard Gardener, Newport, R. I., formerly gardener to Cornelius Vanderbilt, Esq., has raised some good varieties. James Comley, gardener to the late F. B. Hayes, Esq., raised some good sorts, including one called F. B. Hayes, for which he received a medal at the New York show in 1895. He also brought a fine collection from Japan, some of which have been introduced into commerce. Another claim he has on horticulture in the production of his fine rose Oakmont. No mention of the work done by gardeners in this line would seem to me to be complete without reference to the raiser of that grand variety, Mrs. Jerome Jones, viz., H. A. Gane, West Newton, Mass. He is not a professional gardener, but many wish he could be named in the ranks. However, his gardener, John Hargadon, is entitled to some praise. Last year his new seedling, Marcia Jones (exhibited by T. H. Spaulding), was certificated in Boston and Philadelphia. John Farrell, gardener to William Barr, Esq., Orange, N. J., raised Baronald, which subsequently was found to be synonymous with G. F. Moseman. Miss Alice Broome, Mrs. William Barr and John Farrell were also raised by him. He has also raised other meritorious and unique sorts, which Mr. Barr prefers to keep as his private property.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

•• We cannot undertake to reply by mail.

### Grafting Japan Maple.

[Give directions for grafting Japan Maples.—G.]

—The choicest varieties of Japanese Maples are grafted in winter, on stock of Acer polymorphum, by whip grafting.]

### Propagating Privet from Cuttings.

[I have a fence of California Privet, four years old about five feet high, from which I wish to take cuttings this year. Please give directions as to the time of planting, length of cuttings, and treatment, etc.—G.]

—Take wood of last summer's growth and cut into lengths of ten to twelve inches, cutting the tops in a slanting direction and the bottoms straight across. As early in spring as the ground can be worked, open with the spade a line having one side almost perpendicular and about five inches deep. Lay the cuttings four or five inches apart against the side, pressing the ends down, fill slightly and tread firmly with the foot, then fill up to the level.

### Raising Lettuce in Hotbeds.

[Please inform me in your paper about lettuce in hotbeds. I want to start them now. The beds are deep; from 1½ to 2 feet. Is that right? I have plenty of horse manure.—V. A.]

—For making hotbeds for lettuce, etc., the month of February is a suitable time. Good

results can be had from hotbed frames from now on; frames should not be less than two feet in depth, and two and a half feet is not too much. Such a frame allows sufficient manure to be used to hold the heat for a considerable time, for which purpose horse manure is best; or horse manure and leaves. In making a hotbed, it is best to put in a layer of material, then firm it down. I don't know of any better way than tramping regularly over the frame with the feet. If the manure be not firmed all over the beds alike, hills and holes will be the result when the manure begins to heat. The manure can be brought up to within five inches from the sash. It does not matter how firmly the bed is made, the manure will sink down, but if it has been firmed all over alike, it will sink evenly. Soil should be put on soon enough to get thoroughly warmed before planting. Six inches of soil is sufficient. This may seem to be a full frame, but it will sink down and leave head room enough for lettuce, radishes, etc., and the result will be better when the plants are near the glass. Hotbeds do not require much water. When the soil shows signs of needing water, I have found it a good plan, if weather will permit, to take off the sash when rain falls, but never allow the plants and soil to get saturated. Lettuce enjoys fresh air, and if kept too close will damp off; air should be given on every chance. Lettuce can be planted five or six days after making the beds, and should they get hot keep a chink of air on all night.

### Budding vs. Grafting.

[Whether is budding or grafting attended with the greater degree of success on the plum, cherry and peach; if grafting is more successful, what kind of grafting do you approve of, and what is the best time to bud the above fruits? Where can I procure seedling apples to graft on?—J. D. Owl.]

—Budding is practiced for all kinds of fruit trees in preference to grafting. The latter practice is used more in grafting large trees with choice varieties. The time to bud is when the bark will lift freely from the wood, and buds can be procured for insertion, which will range from July to the middle of September. J. D. would get many points from The Nursery Book, by L. H. Bailey (supplied from this office for \$1.00.). Apply to the nearest nurseryman for information about seedling stock.

### For a Showy Garden.

[Between my dwelling and the street in front is a lawn about fifty feet in width. In this lawn are five circular beds in which I wish to plant flowers; the centers of these beds are on a straight line that is parallel with the street. The beds are ten feet in diameter. I want to put in these beds such flowers as commence blooming early, continue blooming until autumn frosts, and make a fine display throughout the season. I am well pleased with such flowers as Celosia, Gaillardia, Petunia, Phlox, Salpiglossis, Salvia, and Zinnia, and want such others as are not expensive, and will not require much care. Are any of the fine Chrysanthemums so hardy that they can remain, uninjured, in the ground where the temperature occasionally gets as low as twelve degrees below zero?

The grass in my lawn is not near so regular as I desire it. There are many small bare spots. Give directions for getting it in really nice condition.—S. G. Johnson, Va.]

[The list named embraces the choicest annuals. So it seems that there is nothing to do but either try them again, or else go in for foliage plants such as Crotons, Sanchezias, etc., but they are more expensive. You could use Cannas in the newer kinds; at least two beds could be filled with these, and be bordered with Pennisetum longistylum (one of the Hare-tail grasses). Pompon Chrysanthemums will stand the temperature spoken of, but you get no results from these till fall, and then they are grand. If the position is not too hot and exposed, Fuchsias and Tuberosus Begonias suggest themselves, or Begonia Vernon and B. Erfordia. For the grass, see Care of Lawns, in our last volume, pages 354 and 370.

### Field Planting of Asparagus.

[Give directions for planting one acre of asparagus, the preparation of the soil, the width of row, variety, age of plants, number to an acre, exposure of land, and manner of cultivation.—Charles B. Long, Mo.]

—The first requisite for asparagus is deeply cultivated and well enriched soil. Being naturally a maritime plant, it prefers soil near the salt water, or land that has been at some time under salt water; it also does well where there is a shale subsoil, possibly owing to the moisture which ascends from such. But almost any land can be made to produce satisfactory crops by liberal dressings of animal and straw manures, and good dressings of common salt from time to time. For your section, we should think that the Palmetto would be the best variety to grow. Two-year-old plants are the best to set out. For one acre, you would need 11,000 plants, and these would be set out one foot between each plant in the row, with four feet space between the rows. This system gives an opportunity, if need be, to secure a crop between the asparagus.

### Scale and Thrip.

[I have a number of Opuntias infested with scale. Will frost kill them? They are on a hardy Opuntia as well as on two tender varieties. If in scraping off the scale I do it outdoors on a mild day, will they be killed by subsequent freezing? What are thrip like? My Pereskia and Epiphyllums have a small, long slim, black insect on them, in summer time, which is exceedingly difficult to get rid of. The leaves or stems turn brown where they have been. Are they thrip? How should I get rid of them?—F. S. C.]

—Thoroughly wash the Opuntias with whale oil soap, kerosene emulsion, or fir tree oil. Scraping will injure the tissue. It is thrips on the Cacti; washing will remove them; they do not like water. If it should be Mexican thrip they are harder to destroy. But the XL vaporizer, an English preparation of nicotine, has been successful in destroying these on orchids in the conservatory of Mr. Hicks-Arnold in this city.

### Fruit Prospects of Eastern Alabama.

(To P. A. W. A.)—The location you name is favorable to grape growing; provided a local market can be found for the crop, or is it to be made into wine on the spot? If it is intended to ship to the New York or Eastern markets, it would, we fear, be a losing venture to enter into fruit raising.

# A Winter Bath in White River

## WHAT CAME OF BREAKING THROUGH THE ICE IN A WISCONSIN RIVER IN FEBRUARY.

From the Chronicle, Chicago, Ill.

Five years ago last winter there was considerable commotion on the banks of the White River, Wisconsin, as a young man named E. N. Halleck, had broken through the ice, and was for some moments lost to view. It was not long, however, before Mr. Halleck came in sight again, and by artistic means was fished from the fluid and restored to society. If the ducking had been all, it would have been well, but unfortunately, the young gentleman contracted a heavy cold, resulting in chronic rheumatism, complicated with disease of kidney and urinary organs.

"For six months," writes Mr. Halleck, "I was laid up, and not able to do anything. During this time I suffered with pains in the stomach and small of the back, and headache, urination was frequent and painful, my heart's action was increased, and I had aches all over my body, and was generally used up. Then I was able to go out, but was a confirmed invalid, and for nearly four years I was in that condition, and expected then that I should always be disabled for nothing that I took gave me any relief.

"In December, 1895, I read an advertisement about Dr. Williams' Pink Pills, and on speaking of it to Mrs. A. E. Derby, she strongly urged that I should take them, as she said she believed they would cure me. I had been under physicians' care for over two years, but as they did me no good I did not ask their advice about taking these pills, but laid in a supply and began to take them. In about ten days I began to experience substantial relief, and continued to take them for four months, by which time I was

cured. The first benefit I obtained was a less frequent desire to urinate, and lessening of that dreadful pain in the back, which ceased altogether very soon. My stomach became comfortable, and my heart's action normal. After the first break my recovery was rapid, and to-day I flatter myself I am a sound man, and able to attend to my business better than I ever could before."

(Signed) E. N. HALLECK.  
I, E. N. Halleck, do hereby certify, that the foregoing statement signed by me is true.  
E. N. HALLECK.

STATE OF ILLINOIS, } ss.  
COOK COUNTY, }

I, John T. Derby, a Notary Public in and for the County and State, do hereby certify that E. N. Halleck, whose name is signed to the foregoing statement, is personally known to me, and that he did in my presence and of his own free will and accord, sign and swear to the same.

[SEAL.] JOHN T. DERBY, Notary Public.  
Dr. Williams' Pink Pills for Pale People are not a patent medicine in the sense that name implies. They are first compounded as a prescription and used as such in general practice by an eminent physician. So great was their efficacy that it was deemed wise to place them within the reach of all. They are now manufactured by the Dr. Williams' Medicine Company, Schenectady, N. Y., and are sold in boxes (never in loose form by the dozen or hundred, and the public are cautioned against numerous imitations sold in this shape) at 50 cents a box, or six boxes for \$2.50; and may be had of all druggists or direct by mail from Dr. Williams' Med. Co.

## OUR PREMIUMS ARE OFFERED

we expect them to obtain the new subscriber and retain the premium. If the subscriber they procure wants a premium (and he doubtless will), he, in turn, should interest himself in the same way. New names sent in direct are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

In our issue of February 6 we published Premium Offers, embracing a vast assortment of Standard, Fancy and Novelty Collections in Seeds, Fruits, Flowers and Vegetables, to which we invite the careful attention of every one of our readers, in the hope that, becoming interested, they will seek to earn these premiums and so increase our subscription list.

The Premiums offered are all of exceptional value; there is nothing bordering on the sensational in the various announcements, and great pains have been taken to secure offers from reliable growers and specialists. As we have previously stated, the publishers of AMERICAN GARDENING neither buy, sell, nor in any way do they trade in the stocks offered, except to mail the orders as received to the growers or dealers making the offers. This arrangement makes it satisfactory to our advertisers, who, in turn, being thus afforded an opportunity to introduce their specialties to likely new customers, at practically no cost for advertising in any of its ramifications, are thus enabled to give values which are unprecedented in the annals of Premiums Offers.

If you are interested, and want more copies of our issue of February 6 for yourself or your friends, kindly drop us a postal card; it will receive prompt attention.

### Some New Roses.

It was but a natural thing that the so-called Memorial Rose (*Rosa Wichuraiana*) should be used as one parent in the production of a group of new Roses; its striking distinctiveness and adaptability to the "wild garden," its free flowering qualities, all were factors to this end.

During last summer we had occasion to call attention to the results obtained by crossing this with some Hybrid perpetual

variety of garden rose, and we now place before our readers representations of some of the best of the progeny thus raised, for some, if not all, of which we venture to predict a happy future.

Than the Rose no flower flourishes so much in popular favor, and there is to-day a noticeable and growing tendency for owners of gardens to look more favorably on sections other than the Teas and H. Ps.

## Connecticut Pomologists Meet.

The sixth annual meeting of the Connecticut Pomological Society was held at Jewel Hall, Y. M. C. A. Building, Hartford, Conn., on Feb. 9 and 10. President J. H. Hale presiding. Those present appeared to be hungry for hard practical discussion.

### Secretary's Report.

The report of the secretary, G. S. Butler of Cromwell, was as follows: He thought a membership of 400 is necessary in order to secure the full benefits of association. It was not thought that the State, which shows a disposition to retrench expenses, will be willing to afford assistance. There has been an increase of more than 75 per cent. during the year in the paying membership. Last August the summer meeting was held at the farm of J. C. Eddy in Simsbury, which proved to be a tip-top affair. The receipts for the year amounted to \$113. The paying membership at the present time is 107. There has been a membership of 162 in the past.

### Treasurer's Report.

R. A. Moore of Kensington, treasurer of the society, being kept at home through sickness, was represented by the secretary. The receipts from membership fees amounted to \$110. The balance on hand a year ago was \$108.63, making the year's funds \$218.63. The expenses were \$11.65, leaving a balance of \$206.98 for the current year.

### Suggestions and Committee Reports.

J. B. Smith of New Britain recommended the offering of premiums for the best acre of orchards. The premium would involve some history of the orchards in the competition. It is desired to find out the effects of pruning, spraying and fertilization. The premium would be \$50. There should also be premiums for fruits grown in the State.

### New Fruits.

Mr. N. S. Platt thought the new fruit crop last season was the most scanty that he had ever known. The new Lewis peach was introduced, but not enough is known about it yet to speak of it intelligently. The Grand Duke and the Prince of Wales plums were spoken of highly by the State pomologist. The new grafted chestnuts commanded his approval. In apples, the Princess Louise, which came from Canada, is a fall product; it is fair in quality, and saleable. The Mackintosh Red comes in the early fall; it is a beautiful apple, but will not keep till the cold weather. The Jacobs Sweet is regarded with favor. He thought our cherries are dwindling away, and approved of the president's disposition to revive the cultivation of this fruit.

### Fruits at Fairs.

Professor A. G. Gulley, who occupies the chair of horticulture at the Storrs Agricultural College, thought every fruit grower ought to be interested in fairs. For the sake of increasing the spirit of rivalry in fruit growing, if for no other reason, the fairs should be encouraged. The arrangement of fruits in the fairs was explained, showing that great care should be taken in putting the fruit on plates, color and form being regarded, and do not be afraid of putting the exhibitor's name right on the exhibit to help the public and the exhibitor. "It is folly not to do this till the judges have passed," remarked the professor, "for if you cannot find judges sufficiently unbiased to render a proper decision when they know the names of those exhibiting, then I say it is time to shut up shop and wait until you can." He offered some excellent advice to officers who have the management of fairs in regard to the arrangement of classes, advising them to have the varieties grouped together, to have all collections and single dishes in competition also grouped. This would add to the appearance of the display and save the judges considerable walking and annoyance. To secretaries and schedule makers, he said, avoid cumbersome rules and do not use the superlative too much, i. e., "Best" plate of Baldwins, etc. The judges will say whether they are best or not. See that the premium list is explicit and that the rules are lived up to. No exhibitor should be permitted to make two entries in the same class, otherwise the large grower

is enabled to grab all the premiums. All exhibits should be correctly named. Offer premiums for the most correctly named exhibits.

### Judges.

Men who take this work upon themselves are not worthless, pay them well. They have reputations to maintain and are worth something more than a dinner (which, by the way, they do not always get.) Judging should be done by score on a scale of points, the day of judging by comparisons is past. There should be but one judge. If possible, the society should have on hand correct fruit models illustrated by two sections, Fall and Winter. After decisions have been made the exhibitors should remain near their collection to help the visitor with information, etc. One gentleman who had often acted as judge, said that from his experience it would be unwise to place the exhibitors' names at first, for the losers would always say the judge was biased. The consensus of opinion was that expert judges would not mind if they did know who the exhibit belonged to and that it would not influence their judgment. Mr. Taber, Poughkeepsie, N. Y., paid a very high tribute to the fruit display at the American Institute Fair at Madison Square Garden last fall. There he said was to have been seen the full advantage of correct naming, and in the display from the Geneva experiment station a man could learn more in a few hours than in a lifetime of reading.

### Bordeaux Mixture.

Professor W. G. Sturges, State Experiment Station, spoke of the substances used in fighting insects in Europe since 1763. Sulphur had almost from the beginning been used in some form or other. In 1842 one receipt consisted of sulphur, snuff, nux vomica, cayenne pepper and tar. In 1881 in the famous vineyards of Bordeaux, France, verdigris which had been put on the vines to keep children from stealing the fruit was thus accidentally discovered to have preserved the vines from the ravages of mildew; from this date the use of copper solutions, and in 1884 the Bordeaux mixture was perfected. In order to get the proper mixture, one in which the copper salt remained in suspension the greatest length of time, good lime was a first essential; both constituents should be properly and thoroughly diluted before being brought together. Then bring them together in the shortest possible time. No matter which was dumped into the other if stirred the effect would be the same and clogging would be avoided. His formula was lime 6, copper 4, in 50 gallons water.

Professor Van Deman advised 6-6-50. Professor Gulley recommended 5-5-50. Asked how he would mix the parts so abruptly when out in the field, Professor Sturges said he would advise the use of a pot boiler which should be going briskly. Next have 45 gallons thoroughly diluted with lime, and into this it was easy to dump the five gallons of copper solution. Bordeaux had proved effectual against black knot since 1886. He would use it for plums and strawberries.

### Preserving Fertility.

Professor Van Deman showed that, in the main, it was brains, not muscles, that were to do the work for the future, and brains were wanted just now to save both farmers and land from bankruptcy. The farmer must cease wasting his brute force in dragging from the city stable manure which only contained 28 pounds of nutriment in 2,000 pounds bulk. He must get his manures in a cheaper form than that, and he would have to adopt measures to rob the atmosphere of its nitrogen, which existed in such large quantities everywhere and could be had for the collecting. Soil needed to be aerated and supplied with humus, and the moisture needed to be conserved, and this could all be done by the use of crimson clover, or cow pea. The clover roots would go down deep and thus bring into action soils that needed nitrogen, and through the tops and roots supply the same. Then by plowing in the whole green crop the necessary humus would be supplied. In recommending hard wood ashes he did not mean pine wood ashes; they were worthless. Phosphoric acid was needed, and they must seek this

through bone, and that was at command in the shape of South Carolina rock. The supply of this was unlimited, it now being obtained in Florida, Canada and Tennessee. Water was needed to dissolve this, therefore keep the cultivator going and endeavor to provide a dust blanket, to prevent evaporation. Cultivate and smooth down the surface immediately. He here remarked that some men work so hard that they have not time to think, and that was why they overlooked the points elucidated.

### Pruning Fruit Trees.

Professor Van Deman said: Head low; peaches at two feet; apples two and a half feet. When these trees get into shape they stand the wind better and fruits are more easily gathered. At the fruiting stage cultivation near the bole of the tree would not be needed, for the shade of the tree would keep down the weeds; the Acme harrow would reach under far enough.

### Fertilisers for Fruit.

For strawberries, grapes, etc., Mr. Taber applied phosphoric acid by means of muriate of potash, with ground bone. Crimson clover, rye and turnip were all used as green crop to plough under; by using a reversible sulky plow he was enabled to turn these crops under a foot deep, and could get value back, approximating \$300 per acre. Professor Van Deman said cultivated land was 3 degrees warmer than uncultivated land, and as warmth was of importance to plant growth this was an essential point, and should not be forgotten. Early cultivation was also necessary.

### Crimson Clover.

Edwin Hoyt of New Canaan opposed Professor Van Deman in his methods of cultivation and the use of crimson clover, arguing that there was a great waste of time, and that it was the most expensive method possible. Humus does not always guarantee moisture, that, he had proved upon swamp lands in a dry summer on his own farm; in Delaware and other Southern sections perhaps the clover would do well. But in Connecticut crimson clover would not stand the winter, or at most where there would be one success with it there would be nineteen failures. As to clover going down deep and stirring up new matter, he seriously doubted whether there was much down below that was worth bringing up. Professor Van Deman remarked that Mr. Hoyt overlooked the point that the clover roots would bring up soils which would absorb nitrogen; that was an important point. Mr. Hoyt's contention was that commercial fertilisers were cheaper, and he could not be persuaded that the soil benefited further than that you returned to the soil just exactly what the plants had taken out and no more.

Professor Gulley remarked: "That is not so; the soil is being benefited more than that; there is an increase of nitrogen." The question was asked can crimson clover be sown in the spring and be cut the same season? Answer, No. One grower said he had succeeded in doing so. This was said to be the only case known. Mr. Roberts said: Why not pass the clover through the cow? The answer was feeding cows doesn't pay. Mr. Barnes asked whether the mulch, which the green crop when growing provided, was not the most potent factor in producing the results spoken of. Mr. Hoyt replied: "Why, yes; you can scatter dry straw over a meadow and even from that see a difference."

### Election.

The election of officers for the ensuing year resulted as follows: President, J. H. Hale, South Glastonbury; vice-president, J. H. Merriman, Southington; secretary, H. C. Miles, Milford; treasurer, R. A. Moore, Kensington; county vice-presidents, W. H. Mansfield, West Hartford, Hartford County; Dennis Fenn, Milford, New Haven; S. B. Wakeman, Saugatuck, Fairfield County; C. I. Allen, Litchfield County; George Webster, Rockville, Tolland County; Lucian Bass, Windham, Windham County; L. P. Smith, Lebanon, New London County; G. S. Butler, Cromwell, Middlesex County.

[The President's address and other valuable matter are held over for want of space.]

## The Fruit Garden.

**Work, read and inwardly digest.**—Keep your eyes open when visiting.

**Ask Questions.**—Don't be afraid of letting the other fellow see you don't know it all; and there is no better way of taking the stiffness out of the first meeting.

**Order List.**—Make out your order for fruits, fighting a little shy of the novelties, unless you have a good stock of standard varieties and have the opportunity and room to experiment for the benefit of yourself and others. If there is a nursery within a few miles make a visit and take your list along and see what they can supply. Know what you want and stick to that, rather than buy something said to be "just as good."

**Planting, My Way.**—For an ordinary nursery tree take two-thirds of a garden barrowload of manure, locate center for tree and have the hole opened three feet wide and a foot deep (more or less, according to the subsoil); now work thoroughly in the bottom half the manure with some of the top soil and tread firm. In the meantime you have seen that the label is all right; cut off any broken roots and mentally pruned the top; next put into the center two or three shovelfuls of soil. Stepping into the hole, a slight movement of the foot will scatter the soil toward the sides, leaving a slightly rounded surface. Having the tree in hand, a quick upward motion, followed by a quicker downward motion of the butt into its place, will practically spread every fine root ready for covering with 1½ to 2 inches of soil. Make firm by pounding. Mix the balance of manure with soil, fill and pound solid to surface. Prune, rake over the surface and mulch. This, followed by the treatment advised in the "Fruit Garden," backed by thorough cultivation, will produce creditable trees. **Joists:** Use only rotten manure, and as close as possible without touching the roots. Bed the roots firmly in the soil by treading and pounding.

**Quince.**—Most housekeepers call for this spicy fruit once a year, and wonder why they are not as plentiful as apples. But, between borers, fire blight, rust, etc., we seldom see a flourishing tree, or, rather, bush, as they do not often reach 20 feet in height. Quinces like a rich, moist soil, require little pruning and when in bloom rank next to the apple in beauty. Champion has taken the place of Orange here, but it ripens later, which makes it undesirable further North. *Rea's Mammoth*, a seedling of Orange, but larger, is said to do well North.

**Correction.**—In "Fruit Garden" for Feb. 6 the note on *Spy* should read: "Transplanted in '93. No fruits."

J. HOLLOWAY, L. I.

**Strawberries for Succession.**—For extremely early, improved Westbrook and Murray's Extra Early, pollenized with Meek's Early every fourth row. These are not only prolific, but are the earliest, the most splendidly colored, and the firmest and best shippers I ever saw. They ripen so early that they can be picked and sold before medium early varieties begin to ripen at all. To follow close on the heels of these I should have Brandywine, Tennessee Prolific, Woolvorton, West Lawn, and Bubach, pollenizing the Bubach and West Lawn with one of the three preceding varieties. These are all superb market varieties and heavy bearers. Then to come next, Aroma and Gandy will give a large crop of the finest late berries. The season can be still further prolonged by having the *Lucretia dewberry*, which ripens just as strawberries are gone.—O. W. BLACKNALL.

**Small Fruits on the Farm.**—I have known a farmer leave his work and tramp all day over the fields, and return at night with a quart or two of wild strawberries that a fruit dealer would have rejected with scorn. He exhibits them triumphantly, and it is scarcely worth while to tell him that one-half his labor would have set out a strawberry bed that would have furnished him with fine berries every day for weeks.—New York *Edger*.

## The Casabanana Again.

An intelligent and evidently close reader of *American Gardening* asks for a little additional information regarding the new claimant for notice from those who love vines. In my remarks on the subject in *American Gardening* for Jan. 30 a misprint made the botanical name *Licania odorifera*. It should have been *Sicana odorifera*.

The plant is quite new even here in the South, and when submitted to botanists last year was not identified by any of them. Finally, however, it was brought to the notice of Dr. Morris, of the Royal Botanical Gardens of Kew (England), who was in New York. He saw the fruit and recognized it as that of "*Sicana odorifera*." I know of no other plant of the genus *Sicana*, and it is possible that the plant is otherwise named in some standard botany. An amateur might well suggest that it belongs to the *Cucurbita*. Yes; "*Cucurbita odorifera*" or "*Cucurbita saccharatum*." Internally when ripe it has more of the appearance of *Cucurbita pepo* than any other of the *Cucurbitaceae*. But for the present, at any rate, the name must stand as above given. So far as we know the best authority gives it that name.

"*Inquirer*" asks what is the best soil for *Casabanana*, and will it grow satisfactorily when planted in the open ground, and what is the best support for the vines. A rich, sandy loam is the best soil for it, but with proper preparation it can be made to grow upon most any kind of soil if fairly rich. Very stiff clay is the worst soil, but even it might be so prepared with the aid of a little sand or leaf mold with a little ashes as to fit it for satisfactory growth. Make the soil fairly rich with any good old compost that will not heat up any more or very little. The soil should be deeply broken, and the manure well worked in and three or four feet in every direction from where the plant will stand. Where it is practicable I think it is desirable to use a cold frame to get the plants started early, then as soon as safe remove the glass and let the plant take to its trellis or support. Transplanted plants, however, seem to do as well as those not removed, but a little gain is made in high latitudes (40 to 45 degrees) by using movable frames. Small frames will answer—2x2 or 2x3 feet.

Any good fertilizer will do to enrich your soil with, using say three pounds of such to an area 6 or 8 feet in diameter. This should be well worked in through a depth of twelve to fifteen inches. On soil inclined to be dry it is well to give a good mulch of straw or leaves. Where the plant is simply staked, the stake should be a stout one and as long as possible, larger even than hop poles. The *Casabanana* will grow up and cover a chimney very much like ivy, but its prettiest growth is on a trellis or fence. The past summer one vine planted in the middle of a forty-foot wire trellis (6 feet high) completely covered the trellis and presented a very pleasing appearance with its twenty-five or thirty well grown and richly covered melons suspended every three or four feet along the entire length. I do not care to say anything that would lead any one to expect to find the most wonderful thing in the way of a vine. There are other vines that are prettier and no one should do the foolish thing of destroying any pretty perennial and replacing it with *Casabanana*. But there is one thing about this plant that renders it superior to many other vines. It has an edible fruit, a fruit of wonderful fragrance, after it becomes fully ripe, and it makes an excellent preserve, for which purpose the fruit should be taken before fully ripe. One perfectly ripe "melon" will pervade a large house with indescribable fragrance. The seeds are much like those of squash; color light brown, with a dark brown band near the edge. The above, I think, contains all the information sought by several inquirers in different sections of the country.—Samuel A. Cook, Milledgeville, Ga.

**Succession.**—It is all important that a strawberry grower should plant varieties that ripen in succession from the very earliest to mid-season, or in many cases very late, because it enables him to sell at a profit a great many more.—O. W. BLACKNALL.

## The Vegetable Garden.

**Thyme and Sage.**—To secure permanency, beds should be renewed every spring; old plants may be divided, and replanted, but cuttings made from the younger growth will root easily; or plants may be readily grown from seed, which is the most satisfactory method.

**Fennel.**—This is a pretty herb, useful and fine for garnishing; once established, will last for years. It may be propagated by division, and will grow easy from seeds sown in spring.

**Mint.**—This should have a corner to itself, otherwise it will overrun the patch, and smother any other plants growing near.

**Chives.**—The green tops of these are much used for flavoring. It starts growing very early in spring; is perfectly hardy, and by its compact and pretty growth, and innumerable purple flowers, makes it a handsome, as well as a desirable, plant for the vegetable garden.

**Paraley.**—Two sowings of this should be made annually—one early in spring, the other about July 20. Plants from this last sowing make the best plants for transplanting into frames for winter use.

**Asparagus.**—Those who have a good bed of asparagus can very easily get some heads some two to three weeks before the main crop, by placing an ordinary frame with sash over a part of the bed, closing the sashes early in the afternoons, so as to keep in the heat. If hot manure is banked round the frame, and the glass covered during cold nights, the crop will come in still earlier.

**Plantations of Asparagus** should receive liberal treatment by a good covering of manure every fall, and when the coarse manure is raked off in early spring. It is a good plan to broadcast a dressing of bone dust and kainit, or nitrate of soda and muriate of potash, at the rate of about 500 pounds each to the acre. When new plantings are contemplated, ground of a sandy texture should be selected, and plenty of manure and crushed bone thoroughly incorporated with the soil. Set out one-year old plants in spring in beds of five feet in width, three rows in each bed, plants 18 inches apart in the rows. This is a convenient width for setting a cold frame on for pushing on in the spring.

**Rhubarb.**—If the best crowns are covered with barrels or boxes, and these, covered with hot manure, shoots will soon commence to push and give an early supply for use. The small, undesirable variety is still too often seen in gardens; there is better satisfaction in being able to pull large, long stalks, which results from having the best varieties planted. *Linnaeus* is the best early variety; *Victoria* is an excellent later sort. Seeds can be sown on well-prepared ground in spring, in rows one foot apart; thinned out in about six weeks to three inches apart. These, by good cultivation, will make good roots for planting in their permanent quarters the following spring. Plant in rows four feet apart, and three feet apart in the rows. For a small garden it is better to buy a few roots.

W. M. EDWARDS, R. I.

It is amusing to see how some of the catalogues give descriptions of fruits which are far from giving the reader an exact description. One which I have before me describes the *Wager* peach as very large, and as bearing heavy crops. Now the facts are, it is a medium-sized peach, and bears fair crops; is an excellent yellow peach for canning, and will bear some years when many other varieties will not.

**If Your Garden Be Very Small,** with but a few hills of blackberries in it, try covering the surface of the ground around them, between rows and hills, twelve inches deep with leaves. Your neighbors will be glad to have you take them away after they have raked them into piles from their lawns. At fruiting time, you will be highly pleased with the result, and will wonder that such fine blackberries can be grown.

# Novelties of the Season.

(THIRD SERIES.)

*In this issue we continue the presentation of a selection of the Novelties of the Season, as seen in the various trade catalogues and lists. The present series will be followed up by others during the next few weeks, when fruits and vegetables will also be included. The descriptions given are those of the introducers.*

## NEW HYBRID WICHURAIANA ROSES.

(See Fig. 48, page 121.)

The habit of these new roses is the same as that of the *Rosa Wichuriana*, or Memorial Rose. The growth is creeping, and the plants, therefore, can be used to cover the ground, stems of trees, pillars, posts, trellises, or any other purpose desired. They are also suited to pot culture. They are the hardiest roses I know of, and will stand any climate or exposure. They thrive well in the poorest soil or on a gravel bank. The foliage is finely cut, thick of a leathery substance, bright green, shining as if varnished, not subject to mildew or any insect, but keeps its full beauty until almost Christmas. The flowers are produced in the greatest profusion, so that a two or three year old plant will bear several thousand most exquisite blossoms, which are deliciously fragrant and last a long time in perfection.

**MANDA'S TRIUMPH.**—This rose is of free growth, luxuriant foliage, and produces large clusters of double pure white flowers, two inches in diameter, beautifully imbricated and well formed, very sweet scented.

**UNIVERSAL FAVORITE.**—This is the most vigorous plant of the set. The long branching shoots are covered with dense bright green foliage. The double flowers are over two inches in diameter, and of a beautiful rose color, similar to the Bridesmaid, and deliciously fragrant. A great variety for any purpose.

**SOUTH ORANGE PERFECTION.**—This is a gem, growing freely close to the ground, and having multitudes of the most perfectly formed double flowers, about one and a half inches in diameter, soft blush pink at the tips, changing to white. It lasts a long time in perfection.

**PINK ROAMER.**—This is without question a hybrid between the Sweetbrier and *R. Wichuriana*, and carries these characteristics in bloom, while the growth, which is very rampant, and the luxuriant foliage, partake more of the latter. The single flowers, which are produced in close heads, are nearly two inches in diameter, bright rich pink, with almost a white center, which lightens up the orange red stamens, producing an effect which, combined with fragrance, makes it one of the most valuable roses in cultivation.

The following awards to these new roses have been made: Manda's Triumph, silver medal from the New York Florists' Club; certificate from the New York Gardeners' Society; honorable mention from the Massachusetts Horticultural Society.

Universal Favorite.—Certificate of Merit from the New York Florists' Club.

Pink Roamer and South Orange Perfection were also awarded a certificate by the same Society.

*From the Catalogue of W. A. Manda, South Orange N. J.*

FIG. 44 ROSE CARMINE PILLAR.

## NEW ROSE "CARMINE PILLAR."

A charming picture and a charming rose. This unique effect might be more often seen in gardens, did the owner but think of it. It can easily be had; so can the rose—a splendid rose with single flowers 12 to 15 inches in circumference—of the brightest rosy carmine, and produced so abundantly that last year's shoots, some 10 to 12 feet in length of growth, were covered from base to top with bunches of flowers from each eye or bud, the flowers on the bunches opening in succession. The display was thus kept up for nearly six weeks, during which it was seen by many leading amateurs and others, and pronounced novel and most decorative. Award of merit by Royal Horticultural Society and certificate of merit by Royal Botanical Society. Those who have seen the rose at Kew when in bloom pronounce it a magnificent sight.

*From the Catalogue of A. Blanc & Co., Philadelphia.*

## CHRYSANTHEMUM SYMPHONIA.

The color of this chrysanthemum is a very beautiful shade of carmine pink, reverse soft silvery pink; it is an incurved and very compact well built flower, with the ray petals drooping making it a very artistic and attractive bloom of medium size. As a bench variety this will prove very valuable as it only grows 18 to 24 inches high, with extra stout stem and handsome foliage. In season Nov. 5th to 20th, but can be kept a long time on the plant without damaging its qualities; crown or terminal buds. Gained 80 points at New York; 81 at Chicago.

*From the Catalogue of John N. May, Summit, N. J.*

## New Imperial Japanese Morning Glories.

These grand new morning glories from Japan are remarkable for the large size and exquisite new colors of the flowers, with magnificent foliage, often beautifully blotched. Of strong, robust growth, the vines grow quickly to a height of 12 to 20 feet.

"They are of all shades of red, from the most delicate pink to the most brilliant crimson and maroon, and innumerable shades of blue, from pale lavender to richest indigo and royal purple; also white, yellow, gray, slate, copper color, brown, bronze, almost black, and many other odd shades not found in any other flower. Many varieties have a distinct marginal band of a different color from the rest of the flower, and some are as elegantly spotted with pink, crimson, blue, brown, etc., as the finest gloxinias; others are striped, blotched, mottled, rayed, and shaded in an indescribable manner, often having seven or eight colors and tints in one flower. Many are of very odd and singular forms; some have the petals separate and distinct clear to the base, others have the tube of the flower bent down on itself at a sharp angle, and then bent back again." (Fig. 45)

*From the Catalogue of W. Atlee Burpee & Co., Philadelphia.*

## THREE NEW RAMBLER ROSES.

The undermentioned three new roses promise to be great acquisitions. They are companion roses, "half sisters" in fact, by blood relationship. They were originated by the well-known German rosarian, Peter Lambert, who has produced several other roses of exceptional value.

**AGLAIA, or YELLOW RAMBLER** is a seedling from *Rosa polyantha Sarmentosa*, Siebold x *Reve d'Or*. This variety has been mentioned in our columns once before, and will probably be the most popular of the three, since it is said to be the first and only yellow climbing rose which has any appreciable degree of hardiness. The introducers say Aglaia has withstood, unprotected and without injury, a continued temperature of from zero to 2 degrees below, and with slight protection in the Winter it should do well anywhere that other roses succeed. It is therefore a great acquisition to our northern gardens. The color is a clear, decided yellow. The blossoms are of moderate size, cup-shaped, nearly full, of very pretty form, very sweetly scented, and last three to four weeks without fading. (Fig. 46.)

**EUPHROSINE or PINK RAMBLER**, a seedling from *Rosa polyantha Sarmentosa*, Siebold x *Mignonette*. Color a clear light red, with numerous golden anthers. A very profuse bloomer and vigorous grower. Similar to Aglaia in nearly all respects save color.

**THALIA or WHITE RAMBLER**, a seedling from *Rosa polyantha Sarmentosa*, Siebold x *Paquerette*; pure white. In other characteristics it is very similar to Aglaia.

The following information is furnished by the introducers:

"These three roses have in common the following characteristics: they are all very strong, rapid growers, making shoots from 8 to 10 feet high in a season. They all bloom in immense pyramidal clusters after the manner of *Crimson Rambler*. Upon Aglaia have often been counted as many as 150 blossoms in a bunch. And here it is interesting to note the strong probability of blood relationship between these three roses and the now well known *Crimson Rambler*. The *polyantha Sarmentosa*, which, as will have been noted, was the seed parent of the 'Three Graces' was brought by Siebold from Japan, from which country also comes the *Crimson Rambler*. The *Crimson Rambler* has a great many characteristics which tend to show that it was a chance seedling from this *Rosa polyantha Sarmentosa*, and if this is the case, it would complete the connection between *Crimson Rambler* and the 'Three Graces.' This supposed relationship is rendered still more probable by the very considerable similarity between them in wood, foliage, habit of growth and manner of blooming."

Messrs. Jackson & Perkins Co., of Newark, N. Y., are propagating and introducing these roses in this country, as the representatives of the originator, under an arrangement they have effected with Mr. Lambert.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1897.

PUBLISHED BY  
A. T. DELAMARE PTO. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1697.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates: 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\*\* OUR friends in the West and on the Pacific Coast especially are warned that DANIEL W. CRANE, late of Soldiers' Home, Los Angeles, Cal., sometime back ceased to have any connection with this office.

Free Seed **A** MERICAN GARDENING has time and Distribution. again, and for several years, drawn public attention to the iniquity of the free seed distribution as practiced in recent years. When Secretary Morton retires from office, the seedsmen of the country will have lost their strongest official champion. What do they propose to do then? Grin and bear it, or, by uniting, force Congressmen to cease their interference with and oppression of a legitimate business.

The Agricultural Appropriation bill was passed by the Senate on Wednesday, February 10. It appropriates \$3,212,942, being an increase of \$57,200 over the bill as passed by the House. The principal item to the increase is \$30,000 for the purchase and distribution of seeds.

If our lawmakers cannot be reasoned into ceasing from interference with the seed business, they must be shamed into it; otherwise, and with the same liberty to continue giving away the people's money, it will not be long before, by force of bad example, the American citizen will expect his Government to supply him free, gratis, on demand, with all the necessities of life; after which,

and quite naturally, he will kick if some of the luxuries be not also thrown in.

But enough words have been used in proving the wrong. The seedsmen must now turn to the people for reparation. At the rate at which the appropriations for free seed are annually increasing, the vitality of the seed trade will soon be sapped, the work of the founders of the industry neutralized, and the United States farmer and gardener relegated to a minor position in the world of agriculture, for the reason that competition has been crushed and the incentive to development and the raising of good seeds utterly thwarted by misdirected governmental paternalism.

There is always hope "that right will prevail" even in countries governed by a despot, and where the aid of enlightened public opinion cannot be enlisted in its behalf. In this country, where the press moulds public opinion, (and with whatever faults it may be charged it is singularly unanimous on behalf of fair play), it need not be the most difficult of undertakings for the seedsmen, through joint endeavor, to interest the Fourth Estate in their cause, and through the press to lay before the masses a vivid picture of the evil now being wrought by this wanton injury to one of the most important industries of the country; and also—of still more far reaching consequence—to set before the people the train of evils in which all industries may find themselves involved if this free seed distribution be allowed to be persisted in.

Educate the lay press, which in turn will educate the people, who in their turn, not desiring to be classed as paupers to be fed at the public crib, will put a quietus to the political career of every Congressman who thinks he is doing a good thing—for himself—when he votes "yea" to a free seed distribution.

The Agricultural Bill will have to be referred, of course, to a conference Committee. The Senate's amendments will not be agreed to except after that Committee's action, if at all. Meantime there is fair opportunity for making assaults upon the whole system of gratuities.—Feb. 15, 1897.

(Signed) J. STERLING MORTON.

The action of the Senate seems for the time to perpetuate and increase the disbursement of public funds for the gratuitous and promiscuous distribution of garden and flower seeds through Governmental agencies in the United States. \* \* \* The founders never believed it the duty of the Government to give gratuities to its citizens, but they all taught that the citizens should gratuitously give their best energies and services to the Government for its maintenance and economical administration.

Unless a full stop can soon be put to this gratuitous distribution, the practice will grow to an enormity which will eventually destroy the retail seed trade of the United States. No branch of industry can succeed, financially, as a competitor with gratuities.

In 1839 there was appropriated \$1000 for the purchase of "rare, valuable and improved seeds" not common to the country; \* \* \* in the year 1897 there has been appropriated \$150,000. If, during the next 58 years, the sum increases in the same arithmetical pro-

portion as it has since that first \$1000 was invested in seeds for gratuitous distribution, it will aggregate the enormous sum of \$22,500,000.00.—Feb. 12, 1897.

(Signed) J. STERLING MORTON.

## New Violet—Mrs. J. J. Astor.

We have received a bunch of blooms of this novelty (so named by permission) from the introducer, George Saltford, the well-known violet grower of Rhinebeck, N. Y., who in the accompanying letter says: "I can guarantee it to be a vigorous grower and free bloomer. The flowers are very large, fully double—borne on long, stout stems, very distinct in color, the red being very pronounced in its composition; it may, perhaps, be described as a red-helliotrope tint. As a distinct break it will interest all violet growers.

Herbs.—There is often a scarcity of herbs, though they are very useful for many purposes; they will grow in any good garden soil, and a corner of the garden should be set aside for them. Some directions for their cultivation will be found on another page of this issue.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**The Gardeners' Mission.**—The professional gardeners of America owe a debt of gratitude to Mr. O'Mara for his able paper, the publication of which was commenced in the last issue of your valuable journal. The article should commend itself alike to employer and employe, and help to raise the private gardener to the standard where he belongs.—ROBT. MILLICAN, N. J.

**English Potatoes.**—I was pleased to read W. M. Edwards', R. I., encomium on the Ash Leaf potato. For information of Jesse Robbins, my plan is to store the tubers so as to secure the first sprouts at planting time, and use when in bloom; afterwards they are too ripe for table use.—H. P.

**American Horticultural Society.**—My attention has just been directed to an editorial, on page 54, current issue of your excellent journal, on the organization of a Society, in New York, bearing the above title. I most heartily approve every word you say concerning the once great and prosperous American Horticultural Society which I had the honor to serve as secretary for eight years, and for which I prepared and published five volumes of transactions, all that have thus far seen the light of day. When I voluntarily retired from the office of secretary, in February, 1890, there were on the roll of paying members nearly seven hundred. I believe every State and Territory was represented, and many foreign countries, including Brazil, the Canadian Provinces, France, Scotland, England, Russia and Japan. The Society was organized in 1880, and held meetings regularly until 1892, the last meeting being held in Chicago just prior to the World's Fair. The present officers are: President, Parker Earle; Vice-president, John M. Samuels; Secretary, Prof. E. A. Popenoe; Treasurer, J. C. Evans. Why such a Society should die in the hands of such men, I am at a loss to understand.—W. H. RAGAN.

## Club Root in Roses.

### Steam Sterilization of Soil.

Club root of roses, due to eel worms or nematodes, is very common and often does much injury. There is no evidence to show that the application of chemicals to the soil will have any material effect in holding these parasites in check. Strong solutions of nitrate of soda and kainit will, doubtless, kill some of the nematodes, but they will also injure the young roots. In our experience injury from nematodes can, in large measure, be prevented by proper methods of handling the plants and soil. Where roses are grown on benches, or even in beds, it is possible to keep the plants entirely free from nematodes by using good, fresh soil made from sod and changing it every year. Particular attention should be given to the young plants. The pots should be sterilized every year, either by hot water or by steam, and only virgin soil from a good grass sod should be used for potting. We have tried sterilizing the soil by steam, and, while the work was successful, we do not consider that it pays where much soil is used.

To sterilize soil in any considerable quantity by steam will require a 15 or 20 horse-power boiler. Our plan is to make a frame of 12-inch boards on level ground. The frame is 6 feet wide and usually 12 feet long, although the length is immaterial. On the bottom of the frame, and running the long way, we lay three rows of ordinary 2-inch drain tile. The drain tile are simply laid end to end, no attempt being made to make the joints tight. An inch pipe is run out from the boiler and is branched so as to carry a 3/4-inch pipe into the end of each of the three rows of drain tile. A valve is put on the inch pipe, in order to control the steam. The soil to be sterilized is thrown into the frame till it is filled to the top, but not tramped. When the frame is full of soil ordinary hotbed sash are placed on the top, and, after making all joints tight, the steam is turned on. It requires about two hours to heat the soil through and kill all life. After the soil is cooled it may be thrown out with a shovel and a new lot put in and sterilized, the same as before. We usually add the manure before the soil is sterilized, but if bone or other chemicals are to be put in the soil, we wait until after sterilization.

B. T. GALLOWAY.

New York grape growers recently formed a new organization at Westfield, N. Y., with the intention of controlling the market price of the grapes. The Fruitman's Guide remarks that "only after the millennium will it be possible to fix the price of perishable objects at the growing end of the line," which is a fact.

Attleboro Falls, Mass.—The annual meeting of the Horticultural Society was held at the residence of Mrs. Henry Mason last week, and the following officers were elected for the ensuing year: President, Frank Ricketts; vice-president, Christopher Abbott; secretary, T. S. Thurber; treasurer, E. R. Burgess.

"La Semaine Horticole."—We are glad to welcome to the ranks of horticultural journals this new Belgian weekly, launched under the directing hand of the veteran, Lucien Linden. Our old friends, L'illustration Horticole and Le Journal des Orchidees, are absorbed into La Semaine Horticole, of which the first number appeared on Jan. 30. It is a well printed sixteen page paper, illustrated.

## Lawns and Potash.

In your issue for Feb. 6 Mr. John Shore recommends (and rightly so) using wood ashes for lawns, but he does not state what quantity of ashes to employ, and so a word of warning may not be out of place.

Only a short time since, a case was brought to my notice where, on account of wood ashes being recommended for a lawn, a carload was bought, and the lawn "well dressed," with the result that the lawn was almost destroyed.

While potash in the form of wood ash is an excellent manure in the hands of those who know how to use it, it is a dangerous article in the hands of the uninformed. Good wood ashes should be used like black pepper, i. e., put on as much as can be just seen, then stop.

If you have a fire-heap where the weeds, hedge trimmings and rubbish from the garden and house are burned excellent lawn fertilizer is to be found in the ash; not a complete fertilizer, it is true, for it will contain little or no nitrogenous matter, but a very fair amount of all the other elements which go to constitute a manure. If you have time and convenience, by all means screen the burnt rubbish before scattering on the lawn. But it is not absolutely necessary that the mass be screened. By carefully raking the lawn afterwards—that is, when the winds and sun have dried and crumbled the material—all stones and sticks can be cleared from the ashes almost as well as if they had been screened previously, and in very much less time. Much burnt earth accumulates in the fire-heap in the course of a year, so that with this burnt compost there is less fear of burning the grass than when pure wood ashes are used.

Coal ashes, too, make a good and valuable top dressing for lawns, especially for heavy soils; but even on light soils they well repay the cost of screening and scattering over the lawns. One purpose they serve is to act as a mulch, and during hot, dry seasons to prevent the surface soil from baking into crust. The potash, too, that these ashes contain is sometimes considerable, varying in different samples from .25 to 2.00 per cent. Of course, the difference is caused by the varying amount of wood burned in the stokehole fires or wherever else the ashes are obtained.

Probably ashes from the furnaces

of a factory would contain as low as .125 per cent of potash. The ashes of coal are valuable also, on account of the sulphates and soluble silicates which they contain, to scatter in the furrows before planting potatoes, especially on heavy land. The writer has seen splendid crops of potatoes taken from heavy land as a result of using coal ashes alone, where, previous to using the ashes, it was difficult to get a crop of beans or cabbage, even after winter ridging the soil.

Sometimes, on account of the heavy nature of the soil, or because a lawn is low and difficult to drain, it becomes a hard matter to get a good, soft, velvety turf. In fact, such lawns more nearly resemble a pavement or a stubble field than velvet. Just such a lawn I saw changed from a "pavement" to a "velvety lawn" by lifting the turf, forking over the soil and putting on a two-inch dressing of coal ashes, upon which the turf was relaid. A dressing of a lawn fertilizer mixed with coal ashes was also applied to the lawn. The result was a good and permanent sward.

W. G. GOMERSALL.

### Seed Germination and Electricity.

The Hatch Experimental Station of the State Agricultural College at Amherst, Mass., has just issued a bulletin in which is a detailed report of a series of experiments of the effects of electric currents upon the germination of seeds and the early growth of plants. Two forms of battery were used and seven varying methods of applying the electric current, while eight varieties of seeds were included in the tests. The application showed a gain in promptness of germination of 32.40 per cent. in twenty-four hours, 21.05 per cent. in forty-eight hours, and 6.33 per cent. in seventy-two hours. A similar series of observations upon growth showed gains for electricity of 17.65 per cent. in twenty-four hours, 11.47 per cent. in forty-eight hours, 2.38 per cent. in seventy-two hours, and 2.38 per cent. in ninety-six hours. It is determined that growth can be best stimulated by application of the current for thirty seconds at hourly intervals.

Time to Prune.—Any time during the autumn, winter, and before the sap begins to flow in the spring, is the generally accepted law; but Professor Slayton, of the Michigan station, states that from experiments, pruning during the winter months was injurious, at least, to apples and pears. The work is best done, he thinks, in October. The movement of the sap then, slight though it is, fills the pores of the wood at the surface of the cut. All cut surfaces of any size should be left for a day or two to dry and then be covered with liquid grafting wax or be painted.

## Western New York Fruit Growers in Council.

(Continued from page 112.)

### The Plant Food Question.

Dr. L. L. Van Slyke of the Geneva station compares the changes of man's mind to the vibrations of the pendulum. People are always ready to go to the extremes. We have passed, or are passing, through three distinct periods of manure application. The first was the farm-made manure, or nitrogen period. This brought on a comparative deficiency of available phosphoric acid in the soil, and gave rise to the phosphatic stage of manuring. Superphosphates then were believed to be a remedy for all soil poverty, and farmers often used ten times as much phosphoric acid as the crops removed, and it became only a question of time, if this manner of manuring were continued, when the soil would become a phosphate bed. The tendency now is to go to the third, a potash period. This is a natural reaction, and undoubtedly desirable if it be not overdone, especially in fruit growing. Wood ashes often give extraordinary results on heavy clay soil. In all cases where results are obtained most economically by the use of wood ashes it is proper for us to apply them. Dr. Slyke also puts in a word of warning against the "stone meal" and "natural plant food" frauds, and criticises the patent medicine style of advertising employed by the manufacturers of fertilizers, etc. Dissolved S. C. rock should be advertised as such, and not as "dissolved bone."

### Willard on the Newer Plums.

S. D. Willard mentions as the result of Mr. Burbank's work the change of varieties now taking place and the introduction of superior seedlings of Japanese sorts mixed with native American kinds. As the leading ones, and most valuable among the newer sorts, he names the following: (1) Burbank, excelling in hardness, good quality and productiveness; excellent for canning; (2) Abundance, which is more generally known, but not equal to the other; (3) Sweet Botan, closely resembling the Abundance, but more productive; (4) Red June, the earliest of those of value, beautiful cherry red, medium to large; (5) Wilcox, cross-bred, of fine quality, large size, hardy, ripening after Burbank; (6) Giant Prune, one of Burbank's creations, requiring further test for productiveness; (7) October Purple, late, promising, has not yet fruited on Willard's grounds; (8) Paul's Early, extremely early, hardy and productive; (9) Field, a seedling of Bradshaw, but ten days earlier; (10) Diamond, tree hardy, ripening late; (11) Prince of Wales, hardy and productive; (12) Monarch, an abundant bearer; (13) Grand Duke, one of the most attractive; (14) Archduke, large, dark, prolific, hardy, a late keeper.

On Mr. Sweet's inquiry about the Willard, Mr. Willard regrets to state that it is one of the meanest of the Japanese introductions; very early. Ogon is of poor quality, but may sell.

Mr. Willard cannot tell the exact degree of cold that the Japanese sorts will endure without injury. A drop of the mercury to 21 degrees below zero, the past winter, made an end to all plums at Geneva. It was the first time that the Japanese were a failure there.

### Stocks for Japanese Plums.

For suitable soils, Mr. Willard prefers peach stocks. Japanese plums on such stocks seem to do better on his grounds, even on heavy soil, when well drained.

### Inventory of the Land.

Professor J. P. Roberts of Cornell tells of the vast stores of plant food found in the 2,000 tons of surface soil (one foot deep) found on an acre of average farm land. In an eight-inch layer of surface soil have been found over 3,000 pounds of potential nitrogen, over 4,000 pounds of phosphoric acid, and over 16,000 pounds of potash. There are plant foods enough for many crops, and the wonder only is that crops are not larger. Professor Roberts concludes that plants often suffer from lack of moisture more than from lack of food, and emphasizes the need of cultivation. It is tillage vs. fertilizer. There are great quantities of plant foods, even in the gravel of the soil, and this gravel, if exposed to

# Manwell Strawberry

Is easily in the lead (a staminate). Of large size and firmness unequalled. Its color would be hard to improve upon. The quality is superb, while the quantity of fruit it matures is simply immense, the yield being greater by one half than Wardwell, Crescent, P. Earle, Beder Wood, Bubach, or Haviland, and several others that have been in the lead. The proof of its value is its ability to outsell all others on the market, bringing for the season 1/2 more than any other variety. For description see AMERICAN GARDENING, July 4th issue, page 419. I also have the exclusive sale of the Hawkeye Runner Cutter, the best and cheapest tool made, can be used by a 12-year old boy. Send for price list to

ALLEN D. MANWELL, P. O. Box, 686, VINTON, IOWA.

Mention American Gardening when you write.

the weather, especially during frequent cultivation, is found to be breaking down and liberating the plant foods. At Cornell 350 bushels of potatoes have been grown on common farm soils, without fertilizers, merely by resorting to frequent and thorough tillage. Potatoes like an acid soil. Rye may precede the potatoes, and be plowed under to make the soil acid. Professor Roberts finally warns against the mistake of trying to substitute commercial fertilizers for tillage and moisture.

#### American Fruit Growers' Union.

A member of the Missouri Horticultural Society addressed the Western New York fruit growers about the merits and aims of the American Fruit Growers' Union.

The problem which this new association is trying to solve is how to market our fruits. The idea is, first, to combine to get lowest rates from the railroads; second, to learn how much fruit is grown, and third, how to market it so that it will not come in competition. The American Fruit Growers' Union is intended to be a central organization to direct and advise shipments. The union has called a meeting for the 2d, 3d and 4th of March next in Buffalo, N. Y.

#### Pear Culture and Pear Diseases.

Professor M. B. Walte, of the Department of Agriculture, refers to the introduction of oriental pears. These have large thrifty leaves and seem to be perfectly at home in the eastern portions of the United States. Kieffer is a half oriental. The less said about the quality of these fruits the better. The Japan pear seems to be yet in its original and unimproved state, and about 200 years behind the times; but perhaps as good a foundation for improvement as our own pear was originally. Now we can cross the Japanese with the European pear, and try to get the vigor of the one and the quality of the other. Smith and Garber are no better than the Kieffer. Possibly by crossing the Oriental and European pears we may finally get something very desirable. Mr. Walte thinks that the future pears of the East will contain at least a tinge of oriental blood.

The pear scab fungus can be controlled by spraying. For fire blight we have two methods of treatment. One is to surround the trees with favorable conditions to resist the attacks. The other is to kill the microbe. The first method consists of pruning the young tree to produce a proper balance between top and root growth, of withholding stable manure, avoiding or restricting cultivation, on fertile soil of seeding to grass and pasturing. Control of the water supply also gives perfect control of the blight. The remedy is to reduce or withhold irrigation. The microbe can be exterminated by cutting out and burning the affected portions of the tree.

#### Some "Russian" History in Iowa.

Permit me to correct some errors of history into which Mr. Bomberger has fallen in your issue of January 23. While it may be truly urged that the Russian epidemic has mostly run its course, and is now so much abated that no more space need be wasted upon it, I yet believe it best to correct errors of fact and keep history straight.

Mr. Bomberger believes that the present ill repute of Russian fruits exists because spurious trees were sent out at first by those who now discredit them. He is one of our younger men and being unaware of the early history of these matters is sincere in his mistakes.

In January, 1878, the writer secured an appropriation of \$100 from the State Horticultural Society to buy Russian scions. They were propagated, and in two years were distributed to the foremost members of the society, especially nurserymen who had facilities for multiplying and distributing the trees. None were sent to Mr. Bomberger because we did not know of him then. I received some two hundred sorts of apples then, and soon after some twenty-five sorts of cherries, about as many pears and a smaller number of plums. I helped

make the distribution and know that others had nearly the same, besides trees and shrubs to the number of fifty to seventy-five. Soon after Mr. Budd returned from Russia there were other distributions and many of us made independent importations so that we had plenty of sorts and of undoubted genuineness.

We all propagated and distributed a few but about the time my trees became fit for market I found them so diseased with winter killing, sun scald, blight and the like that I took alarm and burned them by the thousand, and warned others. Others did the same.

Professor Budd raised a question of veracity and honesty. The late Orange Judd made a visit of inspection to my place. I took him into the nursery and with a knife cut open trees showing him their diseased condition until he said he was satisfied and that he could not doubt his own eyes.

Mr. Bomberger fancies a wide difference in the experience of two keepers of experiment stations near Des Moines. In truth, they agree very closely. Both planted Russian orchards. Both lost most of the trees. One grubbed the remnants out, the other let them stand and now exhibits a few plates (quantities) of Russian apples at the fair. Both issue nursery catalogues which agree. Both list one or two Russian apples for summer, one for fall, and for winter not one. There are no winter Russians in Central Iowa.

Most Russian fruits have disappeared from Iowa catalogues except that of the College nursery at Ames, run by "The Originator of the Russian scheme," Professor J. L. Budd. The following resolutions throw a fair light:

Resolutions passed without a dissenting vote by the Southeastern Horticultural Society, held in New Sharon, Dec. 1-3, 1886:

"Report of Committee on Impending Dangers to Horticulture in Southeastern Iowa:

"Whereas, The universal sentiment, as expressed by the members of this society in their discussions, is that the introduction of most foreign varieties of fruit, particularly those of Russian origin, has been detrimental to the true interests of horticulture, and that all the attempts to grow them profitably have proven failures; therefore, be it

"Resolved, That we recommend to all persons contemplating planting fruits within the limits of this society that they select those varieties only that are known as native varieties, and that have been well tested and have proved their qualities and adaptation to this locality.

In advanced stages of Consumption, Scott's Emulsion soothes the cough, checks the night sweats and prevents extreme emaciation. In this way it prolongs life and makes more comfortable the last days. In every case of consumption—from its first appearance to its most advanced stages—no remedy promises a greater hope for recovery or brings comfort and relief equal to Scott's Emulsion. Book on the subject free for the asking.

SCOTT & BOWNE, Chemists, New York.

"Resolved, That we take this method of warning all persons that foreign varieties of the apple, pear and plum, particularly those of Russian origin, recommended and sold by Professor Budd and sent out from the Agricultural College nursery, at Ames, have, so far as they have been tested in all parts of southeastern Iowa, proved failures, and that we believe that about all the varieties of those Russian fruits so recommended and sold have been tested therein.

"Resolved, That in our judgment, these foreign fruits should be adapted to our conditions by cross breeding and seedling production, to the end that if possible some advantage to horticulture may result.

"Resolved, That our secretary be instructed to forward a copy of these resolutions to the various agricultural papers within the limits of our territory, with a request that they be published for the protection of our people.

"W. S. Fultz, Muscatine; W. Greene, Davenport; C. N. Stewart, Washington; W. T. Richey, Albion; Samuel Rowe, Oscaloosa, committee."

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### HEAVY FEEDING FOR LAYERS.

A special answer given by a prominent agricultural journal to an inquiry about feeding hens furnishes certainly much food for thought. The inquirer desired the most economical ration consistent with the best results in eggs (just what we all want, in fact). The morning ration recommended consisted of nearly one-eighth meal scraps in addition to the ground grains. Besides this, all the cut green bones that would be eaten readily at noon were advised. Almost any preferred grain to be used at night. At the somewhat common reckoning of a quart of feed per day for every eight hens, this would give quite or nearly a half ounce of meal per hen per day, besides all the green bones she wished to eat at one meal. It would be somewhat surprising to find hens fed throughout the winter in such a heavy ration in full health and numbers in the spring. Danger ahead, here.

### SEND FOR THE CATALOGUE.

The easiest and best way for the home gardener to find out what she wants in the way of seeds and plants is by a comparison of catalogues. Questions are often asked concerning places to buy plants, which would be unnecessary if the advertising columns were scanned a little more closely. The columns of American Gardening contain the advertisements of prominent and reliable growers. Send for the catalogues.

### CUPID SWEET PEAS.

So general were the complaints last year of the failure of this interesting sweet pea that one dealer offers this year to refund the money to all who purchased seeds of Cupid from him in 1896. But, in order to insure better results this year, a monograph has been published, entitled "Just How to Grow Cupid." The packets of those of this year will be double the size of those of last year, and, as the seed will doubtless be better, it is hoped that much improved results will follow this year's trials. Only good seed will show what Cupid can really do.

### FREESIAS FROM SEED.

Last year notice was given to the claim that freesias could be grown to blooming in four months from seed. We now find freesia seeds catalogued with the claim that they may be grown to bloom finely in four months from the time of sowing. The freesia seeds freely, and it can be grown from seed readily enough. Whether it will bloom in so short a time remains to be seen. Some experience in growing seedling freesias leads to the fear that the amateur may not find this claim well sustained in practice. The trial will certainly prove interesting.

### ROSE, YELLOW SOUPERT.

One of the interesting plants offered in a limited way last year was this yellow half-sister of Clothilde Soupert. This year it will be quite generally offered, and the price is low. The interest in this plant is partly based on the known good behavior of Clothilde Soupert, and partly on the color. Yellow is an especially popular color at

**"It will go away after awhile."**

That's what people say when advised to take something to cure that cough.

Have you ever noticed that the cough that goes away after awhile takes the cougher along? *And he doesn't come back!*

**Ayer's  
Cherry Pectoral  
Cures Coughs.**

present, and a hardy yellow rose, blooming from May until frost must be a decided acquisition. The yellow Soupert, or Mossella, is not purely yellow, however, but white, shading in the center to apricot yellow; so that, however good it may be, we may hope that it will lead to something yet better. The Soupert roses are specially recommended for window blooming, in addition to being fine garden sorts.

### VARIOUS MIGNONETTES.

Those especially who do not care for the perfume of Mignonettes are likely, through neglect of the plant, to remain in ignorance of its improvement, and of its many good qualities. Good, both in doors and out, fine for cutting and useful for greenery, and blooming extra late in the season, it is really most desirable. It is besides very profuse. Both blossoms and spikes have been largely improved over those of a few years ago, and those who do not grow this plant are losing more than they realize. Some kinds now prominent are: Allen's Delancey, Golden Machet, and improved Victoria. Giant White Spiral, a very free sort, introduced several years ago, is still a good standard sort, but its odor is not pleasing.

MYRA V. NORRIS.

**HALL'S FAVORITE. THE COMING NEW** des competition; the best introduced for years. Forty other kinds pedigree plants. Raspberries, Blackberries, Asparagus roots etc. Hear quarters for Seed and Crop Seed Potatoes, double crop and earlier than other seed.

## WHOLESALE MARKET REPORT

## New York.

Cut flowers are very abundant; business generally speaking is anything but brisk, and for such a part of the season as the present prices are very low. Ordinary grades of roses sell at \$2 to \$4 per 100, and fancy grades, \$6 to \$10. Violets are only making from 25c. to 75c. per 100 for special blooms. A dry goods concern this week offered 15,000 at 15c. per 100. Hot house vegetables are averaging low in quality, so that the price is correspondingly low.

The supply of fancy-head lettuce is limited. When strictly high grade, 75c. per dozen was possible; after that down to \$1 per barrel.

Cucumbers No. 2, 75c. to \$1.25 per dozen; No. 1, \$2.00 to \$2.25 per dozen, by the box. Radishes, \$2.00 to \$3.00 per 100 bunches.

Mushrooms have cleared at last, and the market is consequently a little more steady at figures ruling from 25c. to 40c. per lb.

## Philadelphia.

The improvement noted last week continues. Retail men have been buying more freely, and all kinds of stock has moved better.

Many things are now coming in from the injured districts in Florida, but all vegetables from these localities are in poor condition, and in many instances scarcely pay for freight or express charges.

Florida strawberries are of very inferior quality, and are selling at from 40c. to 60c. per quart.

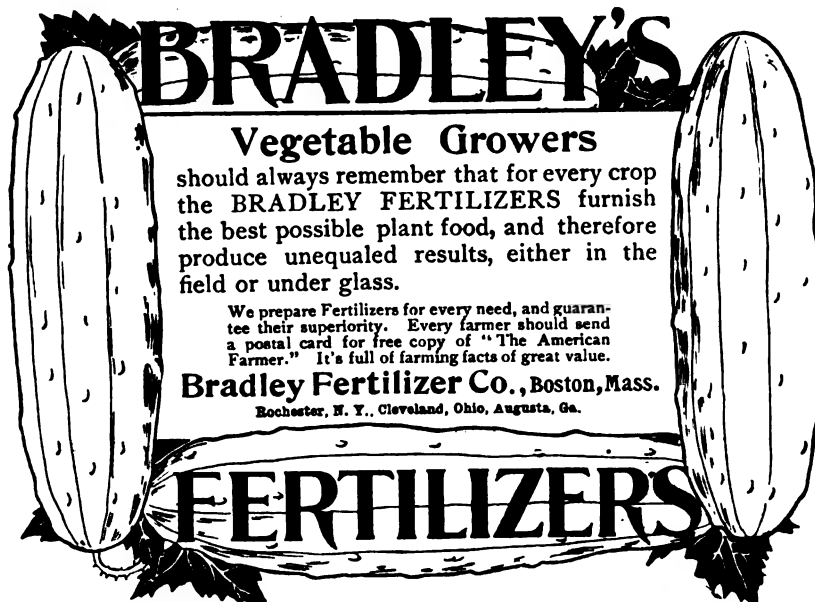

Lettuce is also poor and can be bought from \$1 per basket upward. Expressage on each basket is from 65c. to 75c.

Mushrooms are moving much better, 25c. to 30c. per lb. is now being obtained.

Hot house tomatoes are selling well at 25c. to 35c. per lb. The supply is very limited and more could be disposed of.

There is an entire absence of hot house stock such as Lettuce and Cauliflower. The low prices have probably caused growers to drop these things for this season.

The Jersey farmers are bringing in Sweet Potatoes in large quantities, but are only able to average 15c. per basket.

# BRADLEY'S

## Vegetable Growers

should always remember that for every crop the BRADLEY FERTILIZERS furnish the best possible plant food, and therefore produce unequaled results, either in the field or under glass.

We prepare Fertilizers for every need, and guarantee their superiority. Every farmer should send a postal card for free copy of "The American Farmer." It's full of farming facts of great value.

Mention American Gardening when you write.

## PRIVATE GARDENERS.

New York.

The regular monthly meeting of the New York Gardeners' Society was held at No. 44 Madison avenue Feb. 13. There was an attendance of forty-six members and friends. The retiring president, Peter McDonald, very gracefully introduced the new president, John Shore. Other officers are: Vice-president, R. Angus; secretary, J. M. Hunter; treasurer, W. Anderson.

### The Exhibits.

The display proved to be the largest and best of any yet. A. A. Taaffe, Irvington, N. Y., put up a fine display of the following roses: Beauty, Belle Siebrecht, Bridesmaid, Bride, Perle, Souv. de Wooton, and Mrs. Pierpont Morgan. He also made a remarkable showing of mushrooms. These were of great weight and particularly fine color. A. L. Marshall, Pawling, New York, put up two seedling cannas and some callas of enormous size, some of the spathes measuring fully ten inches in diameter. These were produced from California roots and were, the exhibitor said, planted three in a pot and fed very liberally with either sheep or cow manure water.

W. A. Manda placed on the table Canna John White, and his yellow foliaged Salvia splendens. W. Dickson, Deaf and Dumb Institute, New York city, exhibited what was claimed by all present to be the best bloomed white Cyclamen ever seen in this vicinity. The bulb was said to be two years old and the plant occupied a seven-inch pot. There were eighty-six fully developed blooms, with a large number yet undeveloped. For this a certificate of merit was awarded. A. Wengenter, Bay Ridge, displayed some very fine mushrooms, and, more particularly, a grand lot of Carnations, all of which showed evidence in skill in growing. His new seedling pink, a cross between W. Scott and Mme. Diaz Albertina, showed up to great advantage. Apparently this is a carnation of more than ordinary promise. It has rigid stem, good size and color. (A certificate of merit.)

Mr. Bartholomae, Kingsbridge, made a nice showing of Zonal Pelargoniums, particularly Emerald du Jardin of a delightful pink color; trusses of good size. This is an old, but evidently worthy variety. J. M. Hunter, Hempstead, had a pan of Begonia Eriofolia. Honorable mention was awarded to all exhibitors, excepting the yellow leaved Salvia, which the committee said must be seen bedded out before an opinion upon it could be expressed.

Letters were read from Mayor Strong and C. Mitchell, president and vice-president of the New York Tree Planting Association, relating to the co-operation of the Gardeners' Society with that body. Mr. Mitchell addressed the meeting at length, outlining the work of the association, which, he said, now had a membership of 130. There were five nominations. W. H. Harvey, Port Chester, N. Y., was elected to active membership, and J. A. Manda, South Orange, N. J., as associate member. P. McDonald next read a valuable and concisely worded practical paper on the cultivation of Phalaenopsis.

Madison, N. J.

The monthly meeting of the Morris County Gardeners and Florists' Society was held in Masonic Hall Feb. 10. There was a full attendance and several new members were proposed. Mr. J. N. May gave a most interesting talk about roses, confining his remarks mainly to the present state of the rose market and the comparative stagnation in regard to prices, which were far from satisfactory to the growers. He made some pertinent suggestions for the consideration of rose growers, with a view of better regulating the supply. Unsatisfactory returns were solely the result of the supply being in excess of the demand. There was a remedy in the growers' hands if they would adopt it. It was too much the general practice, after grading the flowers, to ship everything, but it was to the growers' interest to throw away all the low grade flowers. He practiced this himself, and in consequence was able not only to ask but actually to secure better returns on the stock shipped. He spoke highly of the two

roses, Souvernier du President Carnot and Clara Watson. The new Carnations, Lily Dean and Maud Dean, were greatly admired by all present.

### Samuel Henshaw.

We present herewith a portrait of the head gardener to the New York Botanical Gardens, whose appointment was noted in our issue of Feb. 6. Mr. Henshaw was born near Manchester, England, and as the son of the successful gardener at the Priory he was brought up to the profession of a gardener, and had to do with the growing of fine fruits and plants in the old style flue heated houses; he subsequently held positions at Hope Hall and Walley Range, near his native spot, and was under Campbell in the Manchester Botanic Gardens; later he entered into the business of a landscape gardener with his father.

In 1868 Mr. Henshaw came to the States as garden superintendent for J. C. Green, S. I., where he remained for twenty years, and made a name for himself as a competent and skillful gardener. More recently Mr. Henshaw again turned his attention to landscape, and is responsible for the ground work and planting in the grounds of Vassar Hospital, Poughkeepsie, N. Y.; parks for Wappinger's Falls, N. Y.; Gilbert College and Gilbert Home, Winsted,

FIG. 47. SAMUEL HENSHAW.

Conn., and the estate of Mrs. Eldridge at Norfolk, Conn.

In the days of the old New York Horticultural Society Mr. Henshaw was well known as an exhibitor.

### Boston, Mass.

The prize exhibition of the Massachusetts Horticultural Society on Saturday, Feb. 6, was not exceptionally large, but was remarkable for the extra quality of the exhibits. Two collections of orchids competed for prizes, and other fine and interesting specimens were tabled for inspection. The prizes for the collections called for not less than twenty bottles of named species, and the exhibitors were Mr. E. V. R. Thayer (E. O. Orpet, gdr.) and Mr. John L. Gardner William Thatcher, gdr.), who received first and second prizes respectively. Mrs. J. C. Whitin (W. McAllister, gdr.) showed two magnificent specimens of Dendrobium noble. George McWilliam, gardener to Mr. George M. Whitin, received honorable mention for seedling cypripediums and first class certificate of merit for seedling cypripediums. J. E. Rothwell also showed some fine seedling and other cypripediums. On carnations, William Nicholson had the entire field, with no competition, and received first prize on a fine display, comprising Daybreak, Mangold, Scott, Edith Foster, Della Fox, Freedom, Hector, Eldorado, Thomas Cartledge and Nicholson. Alexander McKay, gardener to David Nevins, carried off the honors, as usual, on violets, with a collection of superb flowers, including Farquhar, Marie

Louise, Swanley White, Lady Campbell, Czar and California. James Comley made a fine display of camellias, named varieties, and received first and second prizes. He also made a fine display of cut flowers, among which were noted some extra fine California violets, lilac, Stenocarpus, Cunninghamii, Polygala Cordifolia and Colognyne Cristata. A. Roper showed two vases of seedling carnations, E. Sheppard and Roper's seedling, receiving a complimentary notice on the latter. Other exhibits included Bride and Bridesmaid roses from Joseph J. Comley, freesia from Bussey Institution (Charles J. Dawson, gdr.), Acacia pubescens from John L. Bird and cut flowers from Mrs. E. M. Gill.

One of the most interesting features of the show, and one well worthy of mention was an exhibit by M. H. Walsh, of Wood's Holl, of a dozen specimens of his new seedling hardy white rose, Lillian Nordica. Mr. Walsh received a first class certificate of merit from the society for this rose last summer, and the flowers which he showed last Saturday were from plants which were dug upon Dec. 10 and forced under not the most favorable circumstances. However, they presented the characteristics of the variety to a marked degree, with their long straight stems, rich dark green foliage close up to the flower, which is endowed with remarkable fragrance. This seedling, which is pure white, is from Margaret Dickson, by Mme. Hoete, and is a free bloomer.

### Oceanic, N. J.

A well attended meeting of the Monmouth County Horticultural Society was held in Firemen's Hall on Friday, the 5th inst. An interesting paper on annuals was read by Mr. Wellington Kennedy of Red Bank. The committee appointed to make arrangements for holding a public exhibition in the fall, made a brief report, showing the result of labors thus far. Two new members were elected, and three applications for membership received. The business of the next meeting will be shortened to enable the members to enjoy a "smoker," which has been arranged to take place in the hall immediately after the meeting.

### To Mr. Napier, for Auld Lang Syne.

Noticing that Mr. Napier was writing you page 77 in connection with Gros Colmar Grapes, I ask you to insert this note, as I would like to hear from him, for auld lang syne (Clinton House).

JAMES RATTRAY.

162 St. George street, Toronto.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\*We cannot undertake to reply by mail.

### ROSE LEAVES DROPPING.

(To J. S. G.): A sudden rise in temperature, which would run above, say, 70, or too low a temperature, will produce the results complained of. Supposing your plants have been kept at from 50 to 58 degrees, and the temperature then allowed to fall to 40 degrees, you have the cause right there.

### TIMOTHY AND SPRING RYE.

(Would like to know if I could sow timothy in the spring with success. Would it be better to sow it alone or mixed with some spring rye. I do not care about the other grasses. How much would you recommend to the acre?—F. J. S.)

—You may sow one-half bushel timothy alone, or with one bushel of rye, whichever you wish. Or, better still, with 10 lbs. of red clover; sow in spring.

### TO RAISE HEALTHY PLANTS.

(What is it that gardeners put on their early vegetable plants in flat boxes that makes them have such a rank growth and dark green color? My plants turn yellow and die.—L. M., Mich.)

—It is simply a question of proper treatment, not special foods. To secure healthy, well-colored plants, give ample drainage and liberal soil; do not drown out with water; keep plants as near to glass as possible, and on kinds that will stand it, ventilate freely. Too much heat and water will cause weak and poorly colored plants. Starvation, either by lack of water, root room or cold, will also cause bad color. The happy balance of all these is the only secret.

### AZALEA INDICA.

(To W. R. M.): See answers to another correspondent on page 98.

### ONION FOR MARKET.

(To Skaneateles, N. Y.)—White Globe is the best white onion for the New York market.

### SOWING POPPY SEED.

(Can you give me any suggestions as to the best way of sowing poppy seed in the garden next spring? My experience has been that when sown broadcast the weeds arrive first and crowd out the poppies. Would you advise sowing in rows?—Fred S. Webber.)

—If the weeds arise first, then have recourse to weeding; close attention to this will give good results. You may sow thickly and thin out as necessary. Or, if practicable, sow in drills; that is the best way.

### LETTUCE DISEASE.

(What is the matter with my lettuce? The leaves underneath are dropping off and the edges of the head leaves are getting brown and yellow. Then the green fly is in it, notwithstanding I give a smoke every week. I do water, but little, and heat from 45 to 50 degrees at night. What have I to do?—A. MASS.)

—The wisest thing to do when the trouble appears on a plant is to root it right out and destroy it by burning. The disease is contagious. There is no absolute remedy. You injure your healthy plants by withholding water.

### POULTRY MANURE.

(I have a small city garden and have a quantity of manure from my hen house. Would it do to use it on my strawberry bed or on any of the beds without a mixture of earth?—J. S. S.)

—The cleanings from the hen house should be mixed either with earth or ashes at a proportion, of say two to one, before applying to the land. This helps to distribute the manure more readily and makes it go further. The dung itself pure is very strong and if distributed in a pure state is more apt to do harm than good.

### SCAB ON APPLES.

(Last year all our apples had black spots or blotches all over them, some you could rub off. They are oldish trees and had not been trimmed for years. During the winter I have pruned them largely. I am going to spray with London Purple for the Codlin moth. Will that do any good to the spots?—A. K.)

—The spots, or rather patches, on your apples are due to the scab fungus (*Fusicladium dendriticum*). London Purple should act as a preventive, or you may use Bordeaux. The best thing would be to apply the copper sulphate solution while the trees are yet dormant, following up with the Bordeaux as soon as the leaves appear. If you read the reports of the Fruit Growers' meetings, in this and recent issues, you will get much information.

Names of Plants. (To J. F., Halifax, N. S.)

## Literary Notes.

Surgeon-General George M. Sternberg will review our knowledge of The Malarial Parasite and Other Pathogenic Protozoa in Appleton's Popular Science Monthly for March, telling how they were discovered and upon what grounds they are accepted as specific infectious agents.

Ex-President Harrison has written of "A Day With the President at His Desk" for the March Ladies' Home Journal. The article is said to be singularly interesting in the detail with which it describes the wearisome routine of the President. It is said that General Harrison, in this article, has delivered himself with great directness and vigor, relative to the annoyances that are visited upon a Chief Executive by persistent office seekers.

The nation has grown since Washington's day. For instance, in 1790, the first full year of his administration, there were seventy-five postoffices in the United States. Now there are more than seventy thousand, and the revenue of the Postoffice Department is two thousand times as great as it was then. Scores of unfamiliar fact like these are brought out in an article on the "Early Days of the American Postoffice," which Postmaster-General Wilson contributes to the Washington's Birthday Special Number of the Youth's Companion. Especially appropriate to the season is a charming engraving, "When George Washington was Young," by Frank T. Merrill.

ARE your cows making as much milk and butter as they should? Do you get as good prices for what they do make as you should? SEE OUR UNEXCELLED

# PREMIUM OFFERS

....OF....

Plants, Seeds, etc., in our issue of February 6th.

Our premiums are offered with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will), he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

In our issue of February 6 we published Premium Offers, embracing a vast assortment of Standard, Fancy and Novelty Collections in Seeds, Fruits, Flowers and Vegetables, to which we invite the careful attention of every one of our readers, in the hope that, becoming interested, they will seek to earn these premiums and so increase our subscription list.

The Premiums offered are all of exceptional value; there is nothing bordering on the sensational in the various announcements, and great pains have been taken to secure offers from reliable growers and specialists. As we have previously stated, the publishers of AMERICAN GARDENING neither buy, sell, nor in any way do they trade in the stocks offered, except to mail the orders as received to the growers or dealers making the offers. This arrangement makes it satisfactory to our advertisers, who, in turn, being thus afforded an opportunity to introduce their specialties to likely new customers, at practically no cost for advertising in any of its ramifications, are thus enabled to give values which are unprecedented in the annals of Premium Offers.

If you want a copy of our Premium List let us hear from you and we will mail you one.

# Potash

is a necessary and important ingredient of complete fertilizers. Crops of all kinds require a properly balanced manure. The best

### Bananas and Papayas as Bedders

The accompanying illustration represents a bed of Bananas and Papayas (*Carica Papaya*) as seen in the grounds of the Rose Valley Nurseries, Dongola Falls, Ill., during the past season. The picture was taken about the

The plants used, which were from six-inch pots, set out about May 10, comprise six Bananas and two Papayas, with an edging of Umbrella Grass (*Cyperus alternifolius*). The two center Bananas were of the Orinoco or Horse variety, the others being the Dwarf Cavendishii. The bed

FIG. 48.—A SUB-TROPICAL BED: BANANAS AND PAPAYAS.

20th of September, and at rather an unfortunate time, for we had just had a week of very windy weather, which had torn the great leaves of the Bananas. This bed, which was in an entirely unprotected position (with the exception of an open packing shed on the south) was an oval 18 feet long and 9 feet wide.

was on rich land, but, with the exception of two or three applications of liquid manure, had no manure. Water was applied freely.

At the time the photo was taken the largest Orinoco Banana measured 17 feet 8 inches to the top of the longest leaf, with a trunk circumference at base of 36 inches. The

largest leaf was 12 feet long and 2 feet wide. The plant also had five suckers, the largest of which was 10 feet high; all this from a small plant out of a six-inch pot. During my long residence in the tropics I have never seen this growth surpassed in so short a time.

The Papaya is a plant which I have never before seen used for bedding, and, in my opinion, nothing approaches it in magnificence, and not the least of its merits is its ease of culture. It is as easy to grow as a castor bean. The papaya is a dioecious fruit bearing plant, cultivated in all parts of the tropics, and has ascribed to it the most wonderful properties, such as the making tender of tough meat by wrapping it in the bruised leaves. The plant is branchless and palmlike, with the most elegant foliage.

The specimen at the right of the picture is a male, and at the time the photo was taken was over ten feet high, with a diameter of six feet and circumference of stem at ground of 18 inches. The largest leaf was 3 feet across. The photo does not do the plant justice; it does not show the bone-white mid-ribs and veins, nor the many racemes of thousands of sweetly scented flowers, for it was, in fact, a gigantic bouquet, clusters of flowers appearing at the base of every leaf from top to bottom; some of the racemes were 3 feet 8 inches long and there were at least 10,000 buds and blossoms in all. The flowers are small, waxlike and yellow, and of the most delicious fragrance, perfuming the air for many yards. The plant at the left of the picture is a female tree, which bore nine fruits, each as large as a man's fist. The trees had been topped preparatory to moving into a greenhouse.

The Umbrella Grass makes an elegant edging for a bed of this sort. In the one here shown it stood over 2½ feet high, perfectly even and regular.

The Papaya bears a very delicious fruit and is one of the best to grow in a greenhouse, being as easy of cultivation under glass as is the tomato. We have been enjoying fruit of as fine quality as was ever produced in the tropics. There are many varieties of the Papaya, those of tall, lanky habit being of little use. The bed was presentable as late as Oct. 14.

MARTIN BENSON.

### Plants Under Glass.

**Seed Sowing.**—We should have seeds of Persian Cyclamen already up in the greenhouse, but it is not too late now to sow them; and also seeds of *Grevillea*, *Draecena Australis*, *Eucalyptus globulus*, *Jerusalem Cherries*, *Tuberous Begonias* and *Gloxinias*.

**Propagation** of general greenhouse stock should be going on now.

**Take Cuttings** of *Stevias*, *Marguerites*, *Libonia Penrhensis*, *L. floribunda*, *Centradenia rosea*, *Cytisus racemosus*, *C. elegans*, *Heaths*, *Bouvardia* (root cuttings), *Greenhouse Hydrangeas*, *Carnations* and *Chrysanthemums*.

**Violets.**—A batch of violet cuttings, also soft cuttings taken from hybrid *Roses* which have been forced, and general stock of *Tea Roses* should be put in.

**Old bulbs** of *Gloxinias* and *Tuberous Begonias* should be looked over and the most forward potted up.

**Dormant bulbs** of *Montbretias*, *Gladolus*, *Galtonias* and other summer flowering stock must be looked over to see that all are sound.

**Freeseas and Lachenalias, which have done flowering, should be given a good light place to ripen in.**

**Dahlias** should be started for cuttings.

T. D. HATFIELD.

### Connecticut Pomologists Meet.

President J. H. Hale, in his opening address, said in part:

The year past has been a particularly trying one for the fruit growing interest of Connecticut. Changeable climatic conditions in the winter previous killed the fruit buds or all except the more hardy fruits; the canes of raspberries and blackberries were badly injured, many fields of strawberries were killed out, and all more or less injured; this, followed by drought in May and June, gave our State the lightest and poorest crop of small fruits it has had for many years.

Prices were good, berries were fairly liberal, and commercial growers who had given good winter protection and were able to irrigate through the drought, received satisfactory returns.

Peach and plum crops were almost a total failure, which, considering the magnitude of the business at the present time, was a loss of a revenue of fully one-half a million dollars. Five successive crops previously, however, had demonstrated that the climate of Connecticut was fully as reliable as that of the so-called "peach growing States," and now, with the nearly one million trees in the orchards of the State, the business would continue to be a profitable industry if in every orchard and garden a vigorous fight was continued against the dread disease, the yellows, and all interested in growing, selling and eating this delicious fruit would co-operate with the State Peach Commission in driving and keeping out this disease. Those who would repeal the law are undoubtedly honest in their convictions, but woefully ignorant of the real disease and its effects; but one commercial orchardist was known to be opposed to the law, most of the other opponents being disgruntled owners of single trees, or small groups of them, who had rather have disease and death among their trees than to receive suggestions and help from the State. The owners of over 90 per cent. of the trees in the State were against repeal. Commercial orchardists and well informed amateurs eradicate the disease at first sight, for their own and their neighbor's protection.

The one great blessing of 1896 was the apple crop, the most abundant for many years, and more than usually free from imperfections.

Prices ruled very low and net cash returns were not so great as in former years, but the great crop caused us to seek wider markets, and a trade has been established that will be of lasting benefit. Many small towns all through the South had apples in ear lots for the first time in 1896, and in future years will take many more at higher prices. With good culture, proper feeding, spraying and thinning, the apple is still the king of fruits for Connecticut.

With careful grading and honest packing it will always be a safe and sure money crop, and that, too, on much of our rough hilly lands of little value for other crops. Cherry planting has been greatly neglected; in nearly every home where land is sufficient there is a need of from two to six cherry trees right away this coming spring, while as a commercial crop our markets are ready for the product of many thousands of trees. The new race of Japan plums still continues promising. They are more hardy than peaches, a number of varieties fruiting quite freely in '96 orchards, where the most hardy peaches failed entirely. The earlier varieties ripen here early in July, and a succession may be had till October. A few varieties are very poor in quality, others good, and some superior to any other types of plums known. For canning purposes they are unsurpassed.

The matter of protection against spring frosts is receiving serious attention. Experience seems to indicate that steam is of far greater value than either heat or smoke. Fires at distances of not over fifty feet apart, lightly covered with wet hay or other material, that may be kept wet all the time and yet not put out the fire, will in any but a very windy time, cover the field or orchard with a fog-like vapor that will change the freezing point many degrees.

There are plenty of honest commission men and dealers in the fruit trade; get them out in the field and orchard and get all hands in close touch with one another;

it will do good. A love of the business, judicious advertising, clean packages and honest packing are essential points in commercial fruit culture. New England buyers are the most refined and critical of any and will always pay liberally for fruit that is beautiful and good. The family fruit garden may contain more choice varieties, which through lack of fine appearance or keeping qualities are not acceptable to the markets.

### The Fruit Grower's Prospects.

Considerable discussion took place as to what the fruit grower would do in the future. Mr. Hubbard thought that if everybody was going into it, the apple grower's future was bad, and that the crop could not be profitably grown at '96 prices. Those men who were already in the business and did their work thoroughly, could get on all right. Mr. Allen was of opinion that the business would in the future be in the hands of the largest growers, since they would be able to employ better devices. Cheapening of the cost of marketing and decreased expenses were Mr. Taber's panacea. President Hale said prices were down to stay down, so that for the future figuring must be done on present prices. Mr. Hoyt was not discouraged. Supply and demand would regulate the business. The present depression was due to the marketing of inferior fruit. Small growers should co-operate. They would then be able to trade as a large individual. One grower had 200 trees sprayed and attended to carefully. A New York buyer bought the crop on the trees for \$900. Growers should combine and open a store in a large city, and thus save leakage through the commission men. President Hale supported the commission men. Of course there are good and bad among them, but on the whole they were honest, hard-working men, and probably worked harder than did the farmer, for they were at their business from 1 A. M. in the morning, often sticking to it till 6 P. M. Farmers would hardly care to do that. There were many dishonest growers. Shipments from time to time proved this, and the commission men had their doubts about the growers. A general conclusion was pack straight and prices will be straight. Some one considered it would be well to advertise the crop and sell as much as possible locally. Mr. Collingwood exhibited apples that were retailing on the streets at 5 cents and others at two for 5. Whoever heard of a grower getting prices anything like these figures? Some one was getting the profits, and it was not the grower.

### Peaches.

Fox Seedling, Keyport, White, Lovett's White, were recommended as productive and satisfactory peaches, ripening later than late Crawford. Crother's New was said to be later than Ward's. State Pomologist Platt, speaking of new peaches, said Champion was larger than Mountain Rose, and three or four days later. So was New Prolific (so-called). This was a large yellow peach, identical with an old Michigan variety known to them. President Hale did not like the Champion; did not think favorably of Sneed. This is a very early peach, ripening before Alexander; not a free-stone, yet ripens clear through. Triumph was a special early and had the same qualities as the previous one. The Greensboro was handsome and large; would sell well; not a high quality, but there would be money in it. Wardel was highly spoken of; very early, good quality, not so large as Mountain Rose. Professor Van Deman referred to a Texan variety, Carmen; white skin and yellow flesh. He believed the climates of West Virginia and Connecticut were much the same. If so, this variety should do well in Connecticut. The State Peach Commissioner, in reply to a question as to whether the southern part of the State was particularly liable to yellows, did not consider Connecticut was any worse off than other similarly exposed places, but possibly because of the peach yellows laws more attention was drawn to the disease with them. If the present campaign was continued, the State would soon be free of the disease. No other cure than destruction of the affected tree was known. A committee of eight was appointed to watch the interest of the fruit growers,

especially with regard to the maintenance of the yellows law.

#### Strawberries and Small Fruits.

It was asked whether any one had tried the new Strawberry Culture (Farmer's method). Mr. King had tried it on a half acre with good results. Another grower had been successful on an acre. Dennis Fenn reported fair results. The Lucretia Dewberry, when staked in Spring, three stems to a stake, would yield seventy bushels per acre, which could be marketed early and was a profitable crop. After trying all methods of pruning for raspberries, both black and red, A. G. Sharp of Richmond, Mass., concluded that staking was the best method. Wires had been tried, but dropped. On six acres of reds he had used stakes and hills, and hills improved the flavor. Water was drained off after raining, and the staking gave the needed exposure. According to varieties, plant 4x5, 5x5 and 6x5 feet. Having so much more room between the plants affords plenty of soil for covering during the winter. His favorite varieties were Cuthbert and Marlboro.

#### Plums and Cherries.

The Dwarf Rocky Mountain Cherry was good for ornament only. Asked to name the best varieties, Mr. Hoyt selected Black Tartarian, Governor Wood, Drake, May Duke, Montmorency. A popular variety in Western New York was Robert's Redheart. Professor Van Deman said Wix-on Plum was "very delicious." Mr. Fairchild said: "It is very large and handsome, but has the musty flavor of the Japan Plums, but this disappears on cooking." The Hale was also very favorably commented upon.

#### Pears.

The meeting was asked to name five pears best for market use to cover Fall and Winter demands. Only three were named, namely, Kieffer, Garfield and Lawrence. Professor Guiley advised keeping the heads down for standard pears. "Don't grow trees for the sake of driving horses under." "See to it in pruning," said Mr. Taber, "that the center is kept well open."

#### Novelties and Various.

Mr. Merriman advocated that in order to grow brightly colored fruit, one must prune from the center and let in the sunlight. State Pomologist Platt said if perfect foliage were secured, perfect fruit would follow. Mr. Hoyt said see to breed. Winter Bartlett Pear grows much like Winter Nellis. Bismarck Apple was unfavorably reported. Sutton's Beauty Apple, exhibited by the State Pomologist, was thought very worthy; Professor Guiley and Mr. Hoyt offered scions free to all present. Bismarck Strawberry was said to be excellent. The army worm was the new insect that threatened fruit growers. President Hale, when asked what new implements could be recommended, said the Breed Weeder. He was using it extensively.

### Hudson Valley Hort. Society.

There will be a mass meeting of this newly organized society in Vassar Hall, Poughkeepsie, N. Y., March 11 and 12. The preliminary programme provides on the first day for a session at 10 A. M., another at 2 P. M. and a third at 8 P. M.; two sessions on the second day are arranged for, 10 A. M. and 2 P. M. The speakers so far engaged are Professors Voorhees, Jordan and Beach and Dr. Halstead, Messrs. J. H. Hale and E. W. Wigand. On the evening of the first day there will be two stereopticon lectures on fungi and insects, also a talk by the president, Colonel James Wood, of Mount Kisco, N. Y., on "Beautiful Flowers in Many Lands." Mr. Wigand, a man well known in Washington Market, New York City, will talk about marketing and shipping. The complete programme may be had from the secretary, E. Van Alestyne, Kinderhook, Columbia County, N. Y.

Peter Henderson & Co., the seedsmen of New York city, this year celebrate their jubilee of existence as a firm, and have issued, besides the ordinary edition of their exhaustive catalogue, an "edition de luxe." This differs from the regular in being printed on heavy paper and has a linen back. It is, indeed, a useful handbook, and we are glad to possess a copy.

## The Vegetable Garden.

**Potatoes.**—For early crops, an average of ten days is gained by planting northern grown seed. The Early Northern and Puritan are two excellent varieties for early crop. Carman No. 3 and Rochester Rose are very productive and satisfactory for main crop.

**Manuring the Garden.**—Old gardens often become infested with many weeds, the seeds of which are disseminated through the careless use of manure containing the seeds, and which may readily be killed if reasonable care be given previous to carting the manure on to the land. The

FIG. 49.—LEAFLESS RADISH. (See page 141.)

manure should first be collected together, turned over and thrown into a big heap to heat. If dry, it should be moistened thoroughly. After remaining hot a few days it should be again carefully turned over in such a way as to throw the outside manure into the center of the heap, and vice versa. The little work attached to this operation is well repaid in the resulting absence of the weeds and in advancing the decaying process so essential to render available the plant food contained.

**Pole Beans, Peas, Tomatoes.**—The ground upon which these are intended to be

FIG. 50.—ASPARAGUS PEA. (See page 141.)

planted, should not be made too rich by manuring the same year as planted. It is much better to plant these upon ground that was well enriched for the crops the year previous. If planted on very rich ground they will make a rank growth of vines, with very inferior crops. Should it be necessary to use artificial manures care should be taken to use those low in nitrogen, and high in phosphoric acid and potash. Pure bone dust and unleached wood ashes are excellent for these crops.

**Rich Ground.**—Where such vegetables as celery, cabbage, cauliflower and spinach are grown, the ground cannot be too highly manured. If, after the garden be well manured, there is still a surplus, it should all be added to the celery patch.

W. M. EDWARDS, R. I.

## The Fruit Garden.

**Scale.**—There are now bright days with no wind, when the temperature will rise to 38 or 40 degrees. Then is the time to attend to the scale. If you have the San Jose the best remedy is 2 pounds of whale oil soap dissolved in one gallon of water, and so sprayed on the trees as to cover every bit of wood. This can only be done satisfactorily when the wood is not frozen and on a calm day. Expensive? Yes, so is the increasing San Jose scale.

**Elaeagnus Longipes**, a very ornamental Japanese shrub, has in the last few years come to the front as a new fruit bush. The shrub is covered in May with small greenish-yellow, fragrant flowers, and later with pendulous, bright-red, oval-shaped berries, the pungent flavor of which is very agreeable on a hot day in July. Cooked they have not an attractive appearance, but the syrup makes a good beverage to allay thirst.

**Grapes.**—Prepare any posts needed for the trellis. There are many methods of training the vines, each upheld as good for some personal reasons. Most growers agree, however, that a trellis of some kind is good. A very satisfactory one is constructed of locust posts 9 feet long, set in the ground 4 feet, and standing 8 feet apart in the line; use 4 lines of No. 19 galvanized wire, stretched along these, the bottom wire at 18 inches from the ground, the others 12 inches apart. Does it pay to grow varieties of grapes, which must be covered in winter after the first year or two from planting? Do we not cover more from habit than from necessity?

**Gooseberries** can be increased by mound layering young bushy plants as soon as the ground can be worked; or by cutting back in spring an old bush almost to the ground, and layering the shoots therefrom one year after; also by cuttings made and planted like current cuttings.

**Raspberries** are usually increased by suckers or by layering the tips of the current summer growth in late summer. If the variety be very scarce, early cuttings are sometimes made to work up a stock.

**Spring Planting.**—Have you decided what to move, and just where to plant it?

**Protection from Rabbits.**—A strong wash of whale oil soap, to one gallon of which is added one ounce of carbolic acid, is a good protection to fruit trees where rabbits and snow are plentiful.

**Grafts.**—Have you got them? If not, get them at once. Label and bury them in soil until wanted.

**Cherries.**—The trees are very accommodating as regards soil. They grow less rapidly and fruit more freely if the soil be inclined to dry rather than wet. This is the only difference discernable here. No doubt in a more severe climate a dry situation in winter would be the best. Black Tartarian is a popular kind, which, with yellow Spanish, Early Richmond and Belle Magnifique should find a place in all gardens, even if they had to take the place of some of the other worthless shade trees about the door yard. Pruning amounts to nothing except to shape the trees when young and growing freely. The diseases common to cherries are about equal in any other fruit tree. Why are not more grown?

J. HOLLOWAY, L. I.

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

**As to Packages.**—One firm of berry package manufacturers says in its circular that the way to get both pleasure and profit out of fruit growing is to put up choice fruit in first class packages. Right!

**Is Gregg Tender?**—Some complain of the Gregg raspberry as being too tender; others say it is not so tender. The facts seem to be, very rich soil makes such a vigorous growth on the Gregg that it becomes tender by not having time to ripen the wood thoroughly, while on soil of medium fertility it is hearty enough and produces heavy crops. I once grew the Gregg on very rich soil and it killed back considerably. I now have over an acre of them on soil which is in fair condition (not over rich), but it does not kill back, except for a trifle at the tips.

### Some Notes on Cherries.

About ten years ago the varieties of cherries noted below were received from Professor J. L. Budd of Ames, Ia., and planted on the experimental grounds. They were mostly from his European importations. Most of the trees have fruited for a number of years, but very little has been published concerning their behavior in this climate. The soil on which they are grown is a heavy sandy loam, underlaid with gravel.

As would naturally be supposed, the trees are all perfectly hardy, and have made a good growth. Of nineteen varieties which fruited this past season only a few of them possess any qualities superior to those of our older cultivated varieties, and these would warrant a more extended trial. The greater portion of varieties tested are in no way superior to the old Early Richmond. The following notes were taken during the fruiting season, and are given here for the benefit of those who may wish to plant some of these varieties.

**Brusseler Braune** makes a larger tree than Early Richmond, and has shown itself to be a heavy bearer. The fruit is large and nearly black when fully ripe. Stem two inches long. Flesh firm, juicy and of fine quality. Juice highly colored. It ripens about June 25 in this latitude. This is one of the most promising varieties in the list.

**Montmorency** probably stands next with its large, bright red, showy fruit. In productiveness it equals the Early Richmond, but ripens ten days to two weeks later.

**Lutovka.** A large, bright red cherry, with a deep suture, flesh firm and of good quality, ripening about June 10. This variety has received favorable comments from growers in the East as a promising variety. So far, with us it has been a very shy bearer; otherwise it would be recommended for general planting.

**Griotte du Nord** is a good tree, with fine foliage. The fruit is large, almost black where fully ripe; stem two inches in length, resembles Brusseler Braune in general appearance, but ripens a little earlier.

**Dye House** has been spoken of very highly in some localities, but with us is only of medium quality, no better than many others.

**French Morello** is a large, dark red cherry of good quality and quite productive. It ripens about June 25.

**Montmorency Extraordinary** is of medium size, bright red, good quality, short stem, ripens June 10.

**Fouke Morello** is a large, bright red fruit, of fine quality, short stem, quite productive. Ripens June 8.

**Spate Morello** is a good bearer, fruit medium in size, dark in color when fully ripe. The skin is quite tough, making it a good shipping variety. Ripens June 25.

**Wragg** is a low spreading tree; fruit medium in size, of a dark red color, and of very good quality when fully ripe. Ripens June 25.

**Weir's No. 2** is only medium in all respects; in fact, there are so many that are better we would not recommend it at all, for this locality at least.

**Bessarabian** would be a fine variety if it were more productive, but thus far it has produced very sparingly. The fruit is large, dark and of good quality and ripens about June 20.

**Cerise de Ostheim** is a round topped tree, the branch is somewhat pendulous in habit. It seems to be one of the best varieties of its class that we have fruited. The fruit is medium in size, dark color when fully ripe, flesh firm and tender, juicy and rich. It produces a heavy crop every year.

**Frauentorfer** is a strong growing tree; large, dark red fruit, tender and juicy. As yet has not been prolific enough to warrant us in recommending it for general cultivation.

**Carnation** is a sweet cherry of great promise. The fruit is very large, bright red, rich and meaty. It ripens about June 8, and is a most excellent variety for family use. J. TROOP.

Lafayette, Ind.

### Talk on a Product Car.

As stated in a previous article, a product car is a railroad car fitted up so as to show to the best advantage the agricultural possibilities of some particular section of country that is being advertised. Thousands of people visit it, and the comment is remarkably uniform. The women take to the preserved fruits and the men talk grain and the like. All of them remark that things are magnified, and the only way to convince them of their error is to show them some fruit like crab apples, that they know all about, and which run remarkably uniform all over the country, and call their attention to the apparent natural size, and then tell them that the jar of peaches next the crabs is regarded as being magnified because they have never seen anything so large.

All express a desire to eat the fruit, and if their wishes are gratified in this respect in some instances of exhibits, they would never get out of the car, as the preserving liquid is charged with poison. This is necessary, because the show of form and color can be had only in this way. The different fruits and vegetables all take a different solution, and in no case does it leave them good to eat. It is looks that the management is after, not their taste.

One of the most provoking characteristics of all people is the impossibility of keeping their hands off the exhibits. The mounted animals are placarded and marked "Poison," but the average man or woman is not satisfied unless they put their hands on things. Men will surreptitiously shuck out a single grain of oats, or a grain of corn will disappear, and be pocketed, not because

the jar containing the big snake cucumber and inquire about it, and when they are told that they will grow anywhere, wind up by asking where they can get the seed. They are surprised when they are told that it is obtainable of any seedsman.

One thing is especially noticed, and that is that nearly all speak of the large fruit as "California fruit," although it is a well known fact that equally as large and good is grown all along the Pacific slope. A good deal of the fruit grown in Washington masquerades in the market as from California, and nothing else seems to fill the public demand. It shows the value of a name well advertised.

Another thing which shows the ignorance of the general public in matters of horticulture is that the vast majority of people prefer size and color to quality. An apple that is big and red is always more saleable than a smaller one, although the latter may far surpass it in every desirable quality. Some of the best potatoes are not attractive in appearance, and are thus beaten in the race by their better looking fellows with less character. It is the old story of the fruit tree agent with his book of plates. What appeals to the eye is better to the public than the taste.

In the presence of so much fine fruit there is always more or less of a disposition on the part of visitors to the car to get hold of some of the plants and grow the same kind of peaches and plums at home in the Eastern States. Of course such a thing is impossible, and will ever remain so until there is some way discovered to transplant climate.

A great many ask what alfalfa is, and it is evident that the majority of persons who have never been West

FIG. 51.—POTATO VIGOROSA.

they are natural thieves, but because the disposition to try something new in the farming line is overwhelming.

One of the most remarkable things in the car experience is that more people, ten to one, ask what the bunches of flax are. It is a very common thing for a young woman to ask about it, and an older woman standing by will take the word out of the mouth of the manager and give it instantly. The reason is obvious. The old woman has worked in flax and the young woman is utterly ignorant of the lost household art.

A good many people stop in front of

know nothing about it. Some who have been West and brought back seed report unanimously that it is not a success, referring now to western Pennsylvania and the valley of Virginia. As a rule, the farmer visitor declares that he can raise better corn than that shown from North Dakota, not thinking, or not knowing, that the wonder is that corn will mature there at all.

Take it all around, a product car is an educator, and no one ought to give it less than a very thorough examination should it come his way.

HOWARD MILLER.

## Two New Pears.

**Summer Beauty and Moore's Sugar.**

In your issue of Feb. 6, page 82, reference is made to Summer Beauty and Moore's Sugar pears. These were new varieties to me, and if the quality be what is claimed I should like to secure them. Can you inform me where they are propagated?—W. C. RICHARDS, Connecticut.

In reply to the request of your correspondent, I would state that the Summer Beauty pear was first sent to this division in 1890 by Otto Locke, New Braunfels, Tex. He states that his father obtained scions in 1872 from a tree of an unnamed variety owned by

## The Flower Garden.

A gardener, like a neat housewife, has "never done." To his work there is no beginning, no ending. In the autumn he prepares for winter, in winter for spring. Those who have a greenhouse are fortunately situated, but a good hotbed started now will help considerably.

**Seeds of Annuals.**—Seeds of all annuals useful for cutting, and also those intended for border display, should be sown at once. By transplanting seedlings later into flats, and finally hardening them in cold frames, we can help the season along.

**A Selection.**—Stocks, Asters Senecio Jacobaeus, Phlox Drummondii, Coreopsis Drummondii, especially the variety known as "Golden Wave," annual chrysanthemums, larkspurs, marigolds, snapdragons, Penta-

## Novelties of the Season.

(FOURTH SERIES.)

*The descriptions given are those of the introducers.*

**Asparagus Pea.**—Fig 50.

This is botanically known as *Lotus tetragonolobus*, and has never to our knowledge been grown in this country before last season, when we sent out a number of packets for trial. It produces very beautiful little plants, foliage light green and the flowers, although small, are very bright, being a deep red in color. The pods when cooked like string beans make an excellent dish.

**New Leafless Radish.**—Fig. 49.

This is a very remarkable variety of Radish in that the roots grow so rapidly that the seed cotyledons, which assume a great development from the start, are the only green parts to be seen on the plants, thus giving it the appearance of being leafless.

*From the catalogue of W. Atlee Burpee, Phila.*

**Potato Vigorosa.**—Fig. 51.

It is easy enough to find good early potatoes. It is easy enough to find potatoes that are great producers. But it is not so easy to find early potatoes that are great producers. Vigorosa is early, and is a tremendous yielder, of strong, vigorous growth; hence its name. Skin, a beautiful flesh color, with considerable of a netting; form smooth and regular. The originator is Mr. D. C. Hicks, the well known Vermont seed specialist, who thus describes it: "Vigorosa is an inbred seedling of the good old Garnet Chili. It was a very strong, robust grower from the start, and the second year gave me tubers of marketable size and of very good quality. The form of the tuber also was fixed from the start. The plant has a very tough, leathery foliage. Its productiveness, good quality and beauty of tuber will make it a favorite with all planters." We ourselves have had Vigorosa on trial for several years and have appreciated its value more and more each year. Last season it stood easily first in yield record of all the earlies, and Vigorosa, Thoroughbred and Early Michigan were the only earlies that were not badly affected by the blight or sun scald.

*From catalogue of L. L. Olds, Clinton, Wis.*

**Bovee Potato.**—Fig. 52.

Not only is it the earliest but it takes a leading place among the heavy cropping varieties, an unusual thing among first earlies. It is even earlier than Early Ohio, and compares favorably with Triumph, a light cropping variety that has only extreme earliness to recommend it, while the Bovee in all competitive trials has outyielded all the early potatoes. In many of the tests conducted by experiment stations and private growers it has outyielded even the late varieties. The vine is dwarf and stocky, and the tubers grow remarkably close, all bunched together in the hill close up to the vine. They size up to a marketable size more evenly than any potato we ever saw—none too large or too small—practically the whole crop being merchantable.

*From the catalogue of Peter Henderson & Co. New York.*

FIG. 52.—POTATO BOVEE.

an old gardener in New Braunfels, Tex. Mr. Locke has sent specimens to this division during several seasons. The pear is certainly worthy of trial, and I secured trees for that purpose, which were sent into Connecticut, Michigan, New York, Pennsylvania and Maryland. The pear is as large as the average Bartlett, and is juicy, buttery and quite good. When ripe its general color is a light yellow, with a very brilliant red cheek. I prefer to give a fruit that has succeeded in but a single locality a trial throughout a wide range of country before recommending it for general cultivation.

It is not claimed that the Summer Beauty is a seedling, although it has never been identified by this division. Specimens were sent to P. Barry and to T. T. Lyon. These gentlemen failed to recognize it. Should it be found to be a variety that had already been named Mr. Locke has been informed that the first name will be adopted.

As reported on page 82, I commended a pear, originated by that veteran fruit grower Jacob Moore, of Attica, N. Y., which he has named Moore's Sugar. Mr. Moore has originated many choice fruits, but none I think superior to this pear. There are so many pears named Sugar that I doubt the propriety of adding to the list. I do not know whether or not Mr. Moore will disseminate this variety, but it certainly is entitled to a more distinct name. It is said to have been raised from seed of the Seckel fertilized by the Angouleme. The pear is about two weeks earlier than Seckel, is larger and more beautiful than that variety, and in quality ranks among the best.

S. B. HEIGES,  
Pomologist, United States Department of Agriculture.

A Municipal Tree Inspector has been appointed for the cities of New York and Brooklyn at an annual salary of \$1,200.

temons and Salvia "Blue Beard," are among the most useful decorative plants we can grow, but tastes vary, and the number to select from is legion.

**In the Green House** we sow in flats, covering the soil but lightly. We keep these well watered and shaded until the seeds are up. For small seeds the sub-irrigation plan of letting in the water from below is best. Usually one wetting is enough to last until the seeds are up. Seedlings must be transplanted as soon as large enough to handle, and all the light and air consistent with a proper degree of temperature, say 60 degrees Fahrenheit, obtainable given.

**In the Hotbed.**—A hotbed is best made by using good, warm stable manure, moist enough so that in the process of heating it will not burn, or become dry, and so soon spend the heat. It should be made firm, and allowed to settle for a day or two, and then made up level, or even, and the soil added when the temperature is about 75 degrees Fahrenheit. Three inches of good, fresh loam is enough. We sow in drills, up and down, as the most convenient to reach, and leave room enough between the rows, say ten inches, so that the seedlings do not crowd each other until they grow large. Generally we transplant directly from the frames, no matter how cold the weather is. So long as fermentation goes on in the hotbed, we leave some air vent at night. In a close frame the congestion of foul air is disastrous.

T. D. HATFIELD, Mass.

Henry M. Engle, the well known fruit grower of Marietta, Pa., died recently, aged 78 years. He was a prominent member of the State societies and was the father of twenty-one children.

Dudley W. Adams, for the last seven years president of the Florida State Horticultural Society, died suddenly at Tangerine, Fla., on February 13, aged 65 years. He was one of the founders of the Patrons of Husbandry.

**Encyclopaedia of American Horticulture.**—Under this title the Macmillan Company announces that it will issue a work in three large volumes, illustrated. Professor L. H. Bailey will be its editor, and it is hoped the publication will be completed by 1900.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1894.

PUBLISHED BY  
A. T. DELAMARE PTO. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 3154 Cortlandt. P. O. Box 1897.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Misling Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## Abolish Free Seeds.

Every seed grower, as well as every man who plants a seed, every seedman, florist, and nurseryman, should immediately write a concise and pointed protest to his Congressman against the further distribution of seeds by Government.

As pointed out in previous issues, if this system of paternalism is allowed to continue and flourish, there is no saying where it will stop, and Government competition will so lower the standard of seeds grown, by crushing individual effort, as to relegate the American farmer and horticulturist far to the rear in the world's progressive march.

English Potatoes  
in America.

THE correspondence concerning the, in England, very popular Myatt's Ashleaf Kidney Potato, which has appeared in recent issues of AMERICAN GARDENING, is worthy a moment's reflection. The writers of the various letters are gentlemen who, having come to this country from England, had a desire, which is not an unnatural one, to import into their American gardens the best of what they had been accustomed to use in their old home. The fact that these essays have time and again been proved to be of no practical value seems not in any way to lessen the ardor of those individuals; at all events not until many failures have supervened, or perhaps the palate has become accustomed to the American product.

The problem raised is one of considerable interest from several points of view,

but none more so than in regard to the possibility of acclimatizing a given variety in its new surroundings. There is an abundance of evidence to lead to the conclusion that acclimatization is effected at times, under certain conditions; and as regards the special case of the potato, it is a fact that a very large proportion of, if not all, the varieties sent by our raisers to England have been successfully grown there from the very first. That is, the variety grew and retained its character in its new climatic conditions. Indeed, some of the best known and most reliable potatoes grown in England at this present day are of American origin, notably so Early Puritan. It may indeed be well said that there is a European field for the exploitation of the American potato raiser.

Let us now look at the matter from the other side, and we are brought face to face with a deep problem. There is not in cultivation to-day, in any portion of our land, with possibly one exception, any English variety of potato that has taken root here and flourished, keeping its character true.

It is not at this time our intention to enter into a discussion of the reasons or underlying causes; we wish merely to emphasize the fact that English raised potatoes are not adapted to the climatic conditions with which they are brought into touch in this country; and, therefore, those of our readers who are longing for other potatoes than they now have will get more satisfaction by judicious testing of the introductions of our home seed houses than by wasting time in the foredoomed attempts at acclimatizing foreign standard sorts.

No doubt but that in a few specially favored localities, varieties such as Myatt's Ashleaf may be found to succeed partially, which instances, however, but emphasize the point we make. French varieties are equally failures.

**Grower vs. Commission Man.**—A recently tried case of some little concern to all who are handling fruit commercially is recorded in another column of this issue. The principle aroused is one of importance: Are selling agents to be held responsible for any failure on their part to realize the best market price of the day? No doubt the grower feels keen disappointment when his returns do not coincide with the reports in the papers, but if a decision, as now recorded, be allowed to stand we venture to think that very few growers will be able to engage the services of a commission man in the future. The complaint we generally hear is that of excessive rate of commission charged, which was certainly not the case in the present instance. This fighting between commission man and grower ought to cease, for their best interests are in parallel grooves.

**Quick Returns.**—I like your paper very much. I have already got the worth of the dollar invested.—J. R. J., Ridgetown, Ont., Feb. 10.

## New Apple—Wismer's Dessert.

The accompanying illustration represents in natural size a new apple, of which a specimen has been received from J. H. Wismer, Port Elgin, Ont. There is always some danger connected with the introduction of a new fruit that it has no great merit over existing varieties such as would warrant its dissemination, and as regards Wismer's dessert, were it not for the pear-like texture and exceedingly high aroma and flavor, it would not be counted as anything more than what other apples possess, but these make the variety stand out superior and distinct. Indeed, the delicacy and melting quality of the flesh are most remarkable. The apple is a seedling of Canadian origin; season, late winter; fruit, medium to large, heavy, round, very slightly angular surface, bright red, streaked with deeper red and dotted, flesh pale yellow, very tender, melting and juicy. We understand the trees will be offered for sale next summer.

## Myatt's Ashleaf Potato.

In answer to Jesse Robbins, Carlisle, Pa.: The so-called Myatt's Ashleaf Potato was raised from seed by my uncle, Robert Stratton, in Worcestershire, England, in 1851, he having planted a tuber of Rivers' Royal Ashleaf in some hard ground which caused it to flower and ripen a fruit ball. From the seed sown he obtained several different varieties, round and kidney shaped, colored and white. One he named the Pink Eyed Fluke, from its markings. Another the Eliza. One Alma. And another he named Stratton's Seedling. From these he raised forty pecks, the whole of which he sold to a Mr. Myatt, of Offenham, Worcestershire, at 62 cents per peck. Mr. Myatt called the potato by his own name, and it became so popular that a seedman at Gloucester by the name of Wheeler sold it as Wheeler's Gloucestershire Kidney, and so it has been known and sold under all three names. It has stood the test of over forty years, and is still considered one of the best potatoes grown. Up to 1885 (when I left England) it had invariably carried off the prize wherever exhibited as the best early kidney potato.

The tuber is kidney shaped, rather flattened, broad at one end and blunt pointed at the other, thin skin of a light, yellowish tint, white inside, eyes raised slightly, with small indentures, from which spring the sprouts, medium size, very early and prolific. When cooked it is dry and mealy and of good flavor, generally free from disease, and a good sound keeper. One property it has that I have never known any other variety to possess. You can dig and cook them when the largest is not more than half an inch in diameter, and they will not taste watery or soggy. Planting should be done as soon in the spring as the weather will permit, in a rich light or sandy loam soil well drained. Plant tubers of medium size eighteen inches apart in the row, rows two to three feet apart, according to the mode of cultivation. As the foliage is stunted and not abundant, and the tubers are produced close around the sets, but little space is needed for good results. The principal needs are a rich, light, friable soil, well drained, in which make furrows or drills three or four inches deep. Drop the tubers about eighteen inches apart, and before covering sprinkle a small quantity of dry ashes from wood or weeds (not coal ashes) upon the tubers. Then cover, keep the ground free from weeds by frequent cultivating, mold or ridge the earth against the stems. When they are commencing to form tubers, and as soon as the tops begin to wither or brown, dig and carefully handle and dry before storing. The tubers can be dug for present use as soon as they are the size of walnuts. Treated as I have described, they will never be soapy or soggy. The addition of dry ashes causes the tubers when dug to leave the soil clean and bright. G. M. STRATTON.  
San Francisco, Cal.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**American Horticultural Society.**—There seems to be a good deal of controversy regarding the adoption of the title American Horticultural Society. As a delegate to the convention on Jan. 11, and as seconder, I believe, of the motion to adopt this name, I asked if it were certain the original society was defunct, and was assured it was so without a doubt. Who is to blame in this matter? If the recently launched society has infringed, its duty is very plain: It ought without delay change a title it certainly has no right to use, if the original society still exists.—ROBERT MILLICAN, Monmouth County, N. J.

**Early Celery.**—In a recent number of American Gardening was an article on celery growing by W. M. Edwards, of Rhode Island, where I lived for over twenty-five years. His way of raising early celery is all very well, but is, I think, a good deal of work and trouble. I have had celery for the last nine years at Chestnut Hill, Pa. I plant, or, rather, sow the seed in a small

enough (the rows full enough) to give us a full crop.—T. GRENIER.

**The Japanese Plums.**—I am much interested in the articles under the head of the "Fruit Garden," and value the suggestions contained therein very highly. In referring to the Japanese varieties, Mr. Holloway spoke of an extra early yellow sort as the Organ; Ogon is the correct name for this excellent plum (a typographical error.—Ed). It is one of the best for home use, but not so popular in the markets; its firm yellow flesh has a spicy flavor not found in other kinds. The fruit is larger, and coming in July is very welcome. The tree, however, is not so vigorous a grower as the other Japanese. My experience with the Japan plums has been most satisfactory. I started in some seven years ago with twenty trees, and now have nearly four times that number; and they will be in bearing this coming season. Among my varieties are Ogon, Abundance, Burbank, Satsuma, Willard, Chabot, Normand, Berkman. Of those which I have fruited, Abundance has given me the most fruit, but Burbank has proved the best market sort. Satsuma is of peculiar blood-red color all through, but is valuable for canning. Plums of this class are tremendous growers and begin to fruit very early in life, are not troubled with black knot and are nearly curculio-proof. Their only fault, so far as I can see, is a tendency to overbear. The fruit should

weight will break the limbs if not propped. There is no more luscious fruit to eat from the hand than a full ripe Abundance plum, and coming in before peaches are ripe they fill a very important place in our list of fruits. They cover quite a long season, from the very earliest varieties to the late ripening ones. I have often received as high as 15 cents per quart for these plums, and believe their culture is a profitable venture. Even the small garden should contain a tree or two, as they are so easily grown and will be much appreciated when they begin to fruit. If the weather happens to be damp at ripening time the plums will suffer from rot. I lost a portion of my crop last season from that cause. If any of your readers have been successful in spraying with Bordeaux for this trouble, I should like to hear from them.—H. C. C. MILES, Connecticut.

**Successful Home Culture of Bulbs.**—In one of your issues of the early fall of 1896 there was an interesting article on the planting of bulbs for house blooming. The idea was different from any I had previously heard of, and as I followed the directions and have had, and am having, such satisfactory results, I feel that it is only right to express my thanks to you and your contributor. The plan stated was to immerse the pots when planted in a bed of coal ashes or some such material, covering them a foot or more, and leaving them in a cool place for six weeks or so. I have heretofore potted bulbs and placed them in a dark closet in the cellar, but rarely had perfectly satisfactory flower heads. This year, after potting some two dozen or more bulbs, I placed them in a trench in a corner of the garden, sheltered from extreme cold. After covering each bulb with an inverted small pot, I covered the whole with coal ashes a foot in depth. Planting them in October I did not disturb them till early in December. I then dug out the pots and brought them in. Some were left in the cellar for awhile and others immediately put in sunny windows close to the glass. The result has been most satisfactory. I have had some pots of hyacinths and jonquills quite equal to those seen in city florists' stores. The flowers have grown high and flowered most profusely. I attribute the success wholly to the roots having ample opportunity to grow well before the forcing process began. Now, are these bulbs of any further use? Can they be planted in the garden for bloom out of doors another season? I have Narcissus, Jonquills and Hyacinths.—M. V. ALEXANDER, Massachusetts.

(Bulbs that have been once forced are practically useless. But if you so wish, and you have a border that can be spared, you may plant the bulbs there, and they may produce a few small flowers in a year or so. But in these days of cheap bulbs, it seems folly to thus waste space and time. The Narcissus and Jonquills may be planted in clumps; they do better than Hyacinths when so treated.—Ed.)

FIG. 53.—NEW APPLE WISNERS' DESSERT.

box in the greenhouse about the middle or last of February. Then when the plants are large enough pick out into flats, as some people call them, leave them there until the last week of April, transplant into open ground between Jersey Wakefield cabbage. The last named vegetable is cut and gone by the first week in June. Then hill up your celery, which grows very rapidly. If the weather be dry I use water freely, and by July 4 the celery is all right. This is my experience in growing early celery, but of course every one has his own way of doing a thing.—A PENNSYLVANIA GARDENER.

be thinned severely, especially on the Abundance, going over the trees until you think you have taken off enough; then repeat the act over again. Even then the fruit will not reach its largest size, and its

## The Flower for Everybody. The Sweet Pea: Its History, Culture, Foes.

REV. W. T. HUTCHINS.\*

"With regard to the history of the sweet pea, *Francola Cupani*, an Italian botanist in Sicily, about 1700, was the first cultivator of this flower. There were four original species, two of them natives of Ceylon and two of Sicily. De Candolle, however, speaks of two only, regarding the others as variations of these. Mr. Eckford, of London, began improving this flower in 1885. Mr. Laxton, of Bedford, England, also introduced some valuable novelties, but to Mr. Eckford we must attribute a large part of the honor of developing the flower to its present beauty. To-day California is the second great factor in sweet peas. That State is supplying the best trade stock we have, and exports almost the balance of the world's supply. It seems to me that England, France and Germany must give preference to this California stock. Some growers do not hesitate to grow 250 acres of this flower so as to supply every known variety.

"I shall be expected to refer to rules for the culture of this flower. Those who failed last year had plenty of good company. The causes of failure prevailed from one end of the country to the other. I bent all my energy to escaping the blight, and succeeded only in seeing my vines go up ten feet, blossoming in a scattering way after they were five feet high. There were two main causes, the first being that we had no frost to check a rapid start, and this was followed by an excess of rain during the growing season. One of the worst vices of the sweet pea is a tendency to produce a rank vine and no bloom. Make the plant work, if you want to increase the bloom. The root is the part that works, and the stiffer the soil the more wholesome exercise it gets. The sweet pea should not have a soft bed beneath it as it induces a less hardy growth, indulges the root and weakens it for its after-work; it also favors a top growth beyond the power of the root to support. We have been following the trench system, which means that people have dug down and filled in with loose soil and fertilizer, and the very looseness of this bed under our seed and vines has been enough to make mischief. We have weakened the plants by this soft treatment, and then have imprisoned them at the tenderest age four inches below the sunny surface of the ground and suffocated them still more by filling in the earth before they were at all hardened. If the soil be a light loam, it should be made firm by treading down; but on a clay loam one ought to have good flowers without half trying.

"We had better all of us fight shy of the trench method of cultivation. I have a soft, spongy soil; I plough it in the fall, going over each furrow twice; then hollow out about two inches for the rows, treading the soil, if found soft. In the spring scratch lines an inch deep for the seed and cover it an inch, and roll the soil above and along the sides. A clay loam will settle enough of itself. I believe in spading in the fall for the purpose of mixing, but I should let the frost be my plough in the spring. For ground moles, I resort to tar paper, setting pieces one by two feet in size into the ground every few feet to prevent their running lengthwise of the rows. Of course, catch them if you can.

"Sow the seed as early as possible and liberally enough to allow for various losses. I plant in double rows at the rate of one ounce to ten feet, using more than that if it be cheap mixed seed. After all losses the plants should not stand nearer than three inches apart.

"Go for the cut-worm in the fall just as soon as the frost has spoiled things, put on a good dressing of salt; freeze him out by spading up as late as possible. I find virtue in bran and paris green; a handful of bran with a tablespoonful of the poison stirred in, sweetened a little, and sown on the surface or lightly hoed in in the spring is a simple remedy. Diverting the worms by planting some valueless thing for them to feed on helps. Go out in the morning and kill them before breakfast.

\*Extract from paper read before Massachusetts Horticultural Society.

## Purify Hood's Sarsaparilla

Is the best—in fact the One True Blood Purifier.

**Hood's Pills** are the only pills to take with Hood's Sarsaparilla.

**DISCOVERED** A fine wash that will remove that greasy complexion and leave it soft and white in 10 minutes after washing, and in a week remove all pimples, blackheads and tan. Removes the skin without irritation. Perfectly harmless; contains no poisons. Costs but five cents to prepare enough to last six months. Recipe and full directions, 25 cts. **MRS. B. HUNTER**, 4512 Evans Ave., St. Louis, Mo. Mention American Gardening when you write.

Mention American Gardening when you write.

"The last two seasons have brought another pest. I call it a louse. It colonizes on the under side of the foliage, near the base of the vine, and causes whitish translucent spots on the leaves. Go at it vigorously with tobacco tea or a force of water from the hose. I use the latter, but, with the excess of rain last year it caused the vines to grow up at the expense of bloom.

"The balance of the rules for culture are simple and threadbare. Bush or trellis strongly, and give the vines room to ramble. Water freely after the blooming period comes, but not too much before. Run the rows north and south to give them both morning and afternoon sun on both sides. Almost anywhere near the sea coast sweet peas thrive."

## The Codlin Moth.

### How to Trap It at Night.

In your issue of Jan. 16 Professor W. G. Johnson writes on the codlin moth as it affects the apple, and knowing from experience that an ounce of prevention is worth a pound of cure give the following method which I have found to be a very good preventive from the ravages of the night-flying moth as Professor Johnson calls it. I do not profess that this cure or trap will catch all the moths, but a large percentage of them will be kept from laying on the fruit buds.

Take an ordinary barrel and fill it about three parts with water; hang any kind of a lantern right over the barrel by means of a piece of lath, allowing the bottom of the lantern to hang just inside the barrel and above the water. Choose still nights about the time the bloom is dropping. I say still nights because of a two-fold reason: Firstly, the moth does not fly on a windy night; secondly, it is hard to keep the light in the lantern if windy.

All night-flying insects or moths will fly to a light, and striking against the lantern fall into the water, when the mealy substance that is on the wings becomes sticky and they are therefore unable to rise again. In the morning a goodly number of these night marauders will be captured. I have seen as high as four quarts of moths taken from four barrels, which for all the trouble and expense is a very good return. If this be repeated for two or three nights there will be little or no use of spraying, although I have generally advised one spraying after. J. R. JOHNSON, Ont.

You run no risk in subscribing for *The Rural New-Yorker*. It costs \$1 a year. If it's worth more to you, you make money. If it's worth less you may have all your money back. Do you want a sample copy? The address is New York. We can send it and AMERICAN GARDENING both one year for \$1.80.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### BUFF ROCKS.

A notable feature of the late New York show was the large number of buff fowls present. The beautiful Buff Cochins may be said to rank as a purely fancy bird. But we have now at least three handsome breeds of buffs that are pushing for distinction as general purpose fowls. These are the Buff Leghorns, Buff Wyandottes and Buff Plymouth Rocks. The last are making special claim to superiority as dressed poultry. Besides the usual good qualities of the Plymouth Rock, the Buffs ask notice, from broiler men, on the ground that buff pinfeathers do not show at all on the yellow skin. The color of the plumage is a most attractive one to poultry lovers, and dwellers on the home plot could not find this breed otherwise than satisfactory. The broad claim is made that these are the most promising general purpose fowls of America. And they might well attract attention anywhere.

### EARLY-LAYING PULLETS.

The struggle for a record for early laying is developing somewhat ludicrous features. Four months and a half, four months and three months and a half from the egg are being reported too commonly to cause notice. A late report of a pullet laying at eleven months and one day old has raised a protest from the editor of the poultry paper to which it was sent. He says "It's too young." As a matter of fact raisers of poultry for home use will find it only a detriment to the fowls to be pushed so hard. The birds will lose in size and vigor of constitution more than they gain otherwise. Five months is early enough for young stock to begin to lay, even if of the smaller breeds. With the large breeds six, seven or eight months is often better, as well as nearer the common record.

### STROBILANTHES.

The Strobilanthes Dyerianus, though undoubtedly very beautiful when well grown, is not giving a good account of itself in cool windows. The tendency to legginess shown during the summer has become accentuated, and the plant is far from an ornament to the window collection. It must give place to something that likes cool conditions.

### WINDOW PLANT CULTIVATION.

The duty of cultivation is a point seldom in the mind of the window gardener, yet, if cultivation is one of the largest factors in success outside, it surely ought to count for much indoors also. This especially if water be given at the top of the pot, so that the surface becomes badly baked. It is a point to be borne in mind, however, that fine roots near the surface need great care, and the soil must not be stirred deeply. With many plants, indeed, if there be sufficient room, a slight sprinkling of fresh earth on the top of the pots will do more good than cultivation. Making the soil very porous at the beginning is really the best help.

### NARCISSUS BLOOMS ON SALE.

As the scribe was passing along a New York street last week her attention was attracted by some Narcissus blooms in a glass case. They corresponded almost exactly to the description lately given of the "Giant White Narcissus," the blossoms being very large and the clusters many-flowered. Noticing her close scrutiny, the dealer hastened up to inquire if flowers were wanted. "No," was the reply, "my attention was caught by the large size of the clusters. Are these paper white?" "No," exploded the would-be seller, "they are flowers." "Oh-h!" choked the scribe, "I-I did not mean just that" and hurried on without attempting further explanation. It is often said that most buyers do not know one sort from another. Is it often true, also, of apparently intelligent dealers? It certainly was in this one case.

## Smouldering fires of old disease

lurk in the blood of many a man, who fancies himself in good health. Let a slight sickness seize him, and the old enemy breaks out anew. The fault is the taking of medicines that suppress, instead of curing disease. You can eradicate disease and purify your blood, if you use the standard remedy of the world,

**Ayer's  
Sarsaparilla.**

### VARIOUS SOLANUMS.

Standing in the end door of a commercial greenhouse recently the writer was attracted particularly by one block of blossomy white about half way down the house. From this vantage point said block was the prettiest thing in the house. Closer inspection showed it to be a lot of young plants of Solanum jasminoides, just coming into bloom, four of them more than six or eight inches high. Yet, if one should hand a cluster of these blooms (or of those of the lilac sort) to a farmer he would be likely at once to pronounce them potato blossoms. The family resemblance is very striking, though the Solanum jasminoides has a chaste, aristocratic look not belonging to the denizens of the potato field. The colored sort is scarcely superior in any degree to the potato blossom. The new candidate, the to-be azure blue Rantonetti, has foliage more potato-like than the others. As to bloom, we shall see later.

MYRA V. NORRIS.

## WHOLESALE MARKET REPORT

## New York.

Business, generally speaking, has been fair, with a prospect of continuance. But no advance over existing prices is to be expected. As it is, the market is clearing fairly well at normal figures. A large proportion of Southern stock is arriving in a condition akin to rottenness, and consequently will not make freight charges. At the same time, it lowers general prices.

Local grown hot house stock is also deficient in quality, especially lettuce, for which 50c. per dozen is the top notch. Radishes are also poor; when really good they make \$2.50 to \$3.00 per 100 bunches, but there is not sufficient quantity of this class to speak about.

Celery just now is making fancy figures. When quality is at all good prices range from 60c. to \$1.25 per dozen stalks.

Cucumbers remain as quoted last week.

Mushrooms have improved, and are now clearing at figures ranging from 30c. to 50c. per lb.

Tomatoes, when good and bright, realize 30c. per lb.

Hot house strawberries are selling well at prices previously quoted.

European grapes are in light supply, and prices are stiffening.

Apples—New York perhaps has the undignified position of being the lowest price market just now to be found anywhere. Receipts from September till now and for the week are as follows:

Receipts for week.....	44,873
Receipts since Sept. 1.....	1,107,567
Receipts same time last year.....	597,043

## Philadelphia.

The supply of all kinds of stock has fallen off, but what has come in has found ready sale. Reports from Florida state that there have been very heavy rains there last week, so that what stock is coming in is poor.

Apples show a little weakening, on account of larger supply. Ten car loads arrived on Monday and were held for a higher market. Prices are:

Spitzenberg, fancy.....	2 00@2 25
—fair.....	1 35@1 50
Baldwins, fancy.....	1 40@1 75
—Fair.....	1 20@1 35
Greenings.....	1 35@1 50
Strawberries are scarce and of poor quality and sell at 40c. to 50c. per basket.	
Mushrooms are going better at 35c. and 40c. per lb.: none being left over at these prices.	
Hot house cucumbers are now coming in, and are held at \$2.50 to \$3.00 per dozen, but find few takers at these prices.	
All kinds of vegetables are somewhat scarce.	
Beets, Fla. (few on hand), per crate.....	1 50@2 00
Brussels sprouts, per qt.....	8@ 10
Cabbages, Fla., per crate.....	1 50@2 00
Cauliflower, Fla., per basket.....	1 50@2 00
Celery, extra, per doz. stalks.....	50@ 75
—Fair to good.....	25@ 40
Kale, Norfolk, per bbl.....	75@1 00
Lettuce, Fla., per basket.....	1 75@2 00
Spinach, Fla., per bbl.....	75@2 00
Tomatoes, hot house, per bbl.....	35@ 40
—Fla., fancy, per crate.....	2 00@2 25
—Fla., fair.....	1 25@1 50

Onions, Eastern, white.....4 75@6 00  
 —Eastern, yellow.....2 75@4 00  
 —Eastern, red.....3 25@3 75  
 There are no English hot house grapes on the market and very few Spanish white.

## Grower vs. Commission Man.

A legal decision of great importance was made at Lyons, N. Y., on Feb. 18. J. C. Meyer, of that place, sued W. G. Ahrens, wholesale grocer, of New York city, for alleged loss on difference in prices returned for a car load of apples sold for the plaintiff on Jan. 27, and the market quotation for that time. Goods were shipped Friday, January 24, to J. P. Heard, who has since died; but inasmuch as he was backed by the defendant, Ahrens, litigation proceeded.

Plaintiff contended that apples on the day that he had instructed him to be sold were quoted \$2.75 for greenings and \$3.25 for reds, whereas these had been sold for \$1.75 and \$2.25, respectively; he, therefore, sued for the difference. The defense was that during the time of transit the thermometer fell to 10 degrees below zero, consequently the face of the barrel and all fruit touching wood was frozen and opened up in bad condition. Further, the defense contended that the apples were "repacks" and that the greenings were "scalded."

Every possible means had been adopted to sell at the best price; some fifteen or more buyers had been approached, but owing to the poor condition of the apples, they could not be placed. Eventually they were sold to a reputable house for the price quoted, and only a commission of 5 per cent. charged. The jury awarded a verdict to the plaintiff of \$73 and costs. Notice of appeal was at once given and allowed.

## Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues notes here. They are sent free to our readers except when otherwise stated.]

WISCONSIN FLOWER EXCHANGE, Milwaukee, —Price List of Plants, etc.

E. Y. TEAS, Irvington, Ind.—Price List of Fruit Trees and Plants, etc.

HILFINGER BROS., Fort Edward, N. Y.—Price List of Standard Flower Pots.

WILLIAM BULL, Chelsea, London, Eng.—Catalogue of Seeds. (Illustrated.)

NORMAN COLE, Glens Falls, N. Y.—Price List of New Hybrid Gladiolus.

W. ATLEE BURPEE & Co., Philadelphia.—Price List for Market Gardeners and Florists for 1897.

REV. W. T. HUTCHINS, Indian Orchard, Mass.—Sweet Pea Annual for 1897; contains list of all the novelties and standard sorts, with full cultural directions for outdoor culture. The Annual is illustrated; among the pictures shown are photographs of several Sweet Pea specialists.

JAMES CARTER & Co., London, Eng.—A large and beautifully gotten up catalogue of Tested Garden Seeds, containing many illustrations, the greater portion of which are reproduced from photographs taken from nature. A handsome colored plate of single and double primulas accompanies this catalogue.

W. ATLEE BURPEE & Co., Philadelphia, Pa.—Farm Annual. From the present issue of the Annual we learn that this well-known firm has "become of age"—in other words, has reached its 21st year; and a glance at the contents of the Annual will show that the firm attains its majority under the most favorable auspices, and in the healthiest possible condition. Full descriptions are furnished, and the endorsements of those who have raised seeds supplied by the firm go to show that the Annual, as claimed, tells "the plain truth about seeds."

# Wounded and Paralyzed.

## AN OLD VETERAN OF THE WAR AFTER YEARS OF SUFFERING HAS A SHOCK OF PARALYSIS.

From the Press, Utica, N. Y.

Mr. David G. Talbot is a well-known and respected citizen of Otsego County, New York, residing at Edmeston, who three years ago had a stroke of paralysis, which he attributes to the effects of a wound received on the 16th of June, 1864, before Petersburg, Va., while serving with the New York Heavy Artillery.

The following is his own account of his illness and convalescence, which will be found interesting:

EDMESTON, N. Y., Aug. 31, 1896  
 "On the fifth day of December, 1893, I was taken with a paralytic shock, which affected the whole of the left side, and I could not speak for three weeks. I was confined to my bed for a long time and constantly attended by a physician, though little relief was experienced. My stomach and the muscles of my throat were much affected. I was wounded in June, 1864, at Petersburg, Va., having then lost three fingers of my left hand, and that always affected me in a marked degree, my arm often becoming numb. I should state that on the day I received the stroke, I had two distinct shocks, the first in the morning, which was so light that the doctor was not at all alarmed, but the second nearly finished me up. Ever since the war I had suffered with nervous debility, and my condition was very bad when I was attacked. I am now sixty years old, and hardly dared look for anything approaching good health after my life

of suffering, but I saw so much said about Dr. Williams' Pink Pills for Pale People in the newspapers, and that they were good for paralytics, that I determined to try them. This I did just one year and four months ago. I strictly followed directions and felt better within a week. I am not the same man I was when I began to take Dr. Williams' medicine. My old comrade, Norton, who was in the same company and regiment with me, and was a grievous sufferer from general nervous debility, at my recommendation has taken Dr. Williams' Pink Pills, and they have helped him wonderfully.

"I certify on honor that the above statement is true in every particular.

(Signed) DAVID C. TALBOT.  
 JOHN C. LAPPEUS.

Dr. Williams' Pink Pills contain, in a condensed form, all the elements necessary to give new life and richness to the blood and restore shattered nerves. They are also a specific for troubles peculiar to females, such as suppressions, irregularities, and all forms of weakness. They build up the blood, and restore the glow of health to pale and sallow cheeks. In men they effect a radical cure in all cases arising from mental worry, overwork, or excesses of whatever nature. Pink Pills are sold in boxes (never in loose bulk) at 50 cents a box or six boxes for \$2.50, and may be had of all druggists, or direct by mail from Dr. Williams' Medicine Company, Schenectady, N. Y.

## PRIVATE GARDENERS.

### Appointment.

James Woods has been appointed orchid grower to W. Barr, Barnard, Orange, N. J., in succession to William Fitzwilliam, who has resigned and seeks another place.

### Springfield, Mass.

Rev. W. T. Hutchins has been elected president of the Amateur Horticultural Society, in place of Mr. Wills, who declined to serve.

### Hempstead (L. I.) Hort. Society.

The above society held its regular monthly meeting in the King's Daughters House, Hempstead, on Monday, February 3, to which the most prominent residents of the township were invited. The meeting was a most successful one. The exhibits of plants and cut flowers, and the interesting discussions on same, created a lasting impression, and the local florists look forward to good results.

Mr. Miller, Oasis Nursery, exhibited some well grown Lorillard tomatoes and three different brands of mushrooms. Chris Beal, of Mineola, showed a fine display of carnations, including some new seedlings. J. Sidenburg, Hempstead, made a display of flowering plants and cut flowers; Weston Brothers, a group of ferns and cut carnations; C. W. Ward, Queens, sent a vase of Scotts; Mr. Kindsgrab put up a fine bunch of the California violet, and John M. Hunter a pan of Begonia Erfordii. The society intends to hold an exhibition in April for the purpose of encouraging the purchasing of Easter plants.

### Philadelphia.

Although the attendance was not very large at the meeting on Feb. 16, owing, no doubt, to its being spring election day. Mr. Joseph Meehan read an interesting paper on Herbaceous plants, and the hints on their cultivation was very valuable. Mr. Thilow explained the plans of flower beds submitted in the Ridgway contest. The premium for mushrooms offered by Henry F. Michell, was awarded to Wright & Ward, who staged a grand dish which was greatly admired. The premiums offered by Clarence H. Clark, Esq., for vegetables and salads, were awarded to R. C. Kalign and James Westcott, respectively.

### New York.

The first floral meeting of the horticultural section of the American Institute will take place on March 9, at their own rooms, Nos. 111-116 W. Thirty-eighth street. This will afford an excellent opportunity for those who have seedling carnations or other novelties to exhibit to put them before the public. Certificates will be awarded to meritorious varieties. The president, Dr. Hexamer, solicits exhibits of every kind, and anticipates a very successful meeting.

### Honor to Whom Due.

Mr. Murdoch, on page 18, says that when he was a bit younger he was foreman under gardeners when they came to the front in producing first-class grapes. I say it was quite different with Mr. Murray, as he did not keep any such men as foremen, but gave each man charge of a certain department, and if he did well in it to that man he gave the credit. Moreover, I did not in my first letter say: I was superintendent gardener or that I had "entire" charge, and Mr. Murray himself says that I had charge of the grape house referred to.

ALEXANDER NAPIER, N. Y.

**The Water Hyacinth**.—This interesting aquatic is responsible for an immense amount of inconvenience to boatmen on some of the heretofore navigable rivers of Gulf. Introduced within recent years to those rivers, it has increased so rapidly that it covers square miles of surface with a dense matted growth, interfering with and at times compelling steamers to come to a standstill. In the United States Senate, lately, an appropriation of \$10,000 was sanctioned to enable the Secretary of War to investigate methods of ridding those rivers of this nuisance.

## American Carnation Society.

The sixth annual meeting of this society was held in Cincinnati on Thursday and Friday, Feb. 18 and 19. There was a large attendance of carnation growers present, and the flowers exhibited showed wonderful improvement over those displayed on former similar occasions. The exhibition was pronounced by experts to have been the finest ever seen anywhere.

Among the principal varieties shown may be mentioned the following: Seedlings, White Cloud and Storm Queen, both white having extremely large flowers and strong, stiff stems. These were exhibited by Fred Dorner & Sons Co., La Fayette, Ind. This firm also displayed some magnificent Uncle John, white, a variety which has been found difficult to grow by most carnation men on account of its susceptibility to the disease called rust. Dorner & Sons Co. also made a grand showing with a collection of 500 flowers comprising the best standard varieties and many other promising seedlings, more particularly those showing yellow ground.

E. G. Hill & Co. exhibited their new white variety, Flora Hill, which obtained the Carnation Society's certificate at New York last year. This kind was awarded the prize for the best 100 white on exhibition. The same firm also showed Mars, a scarlet seedling which also captured the prize in that class. Other new kinds in this exhibit were Painted Lady, pink; and Whitcomb Riley, a large white pencilled with carmine.

W. N. Rudd of Chicago exhibited two grand vases of Jubilee, which were the admiration of the visitors.

C. W. Ward, Queens, N. Y., had some new seedlings, among them Charles A. Dana, a beautiful shell pink; John Young, white, and Mrs. James Dean, pink.

Breitmeyer & Sons, Detroit, Mich., carried off the prize with their yellow variegated variety, Mayor Pingree.

Other prize-takers were R. Witterstaetter, Sedanville, O., for Emma Wachter, a bright pink seedling; Dorner & Sons' Co., for their white variegated Mrs. George M. Bratt, which were marvels of good cultivation.

The society was very sparing in dispensing its certificates, only three being awarded. These were given to F. Dorner & Sons' Co., one each for White Cloud and Storm Queen as third-year seedlings, and to W. J. & M. S. Vesey for Fort Wayne, as second-year seedling scarlet.

The sessions of the society were held in the Gibson House and were very largely attended. The president, in his address, recommended a fixed scale of points, also a scale each for exhibition and commercial varieties. These points were discussed and scales finally adopted.

W. R. Shelmire of Avondale, Pa., read a very able paper on the "Carnation," from the taking of the cutting to planting in the field, in which he described his method. The paper was exceedingly practical.

At the Friday morning session Chicago was selected as the next meeting place of the society, and the following officers were elected: President, W. N. Rudd, Chicago; vice-president, Fred Dorner, Jr., Lafayette, Ind.; secretary, Albert M. Herr, Lancaster, Pa.; treasurer, Charles H. Allen, Floral Park, N. Y.

Mr. Henry Weber, of Oakland, Md., read a very instructive paper on the "Carnation in the Field and in the House."

In the discussion which followed the reading of this paper several growers intimated that they had abandoned all overhead watering because it induced spot and rust. As a remedy for red spider, thorough ventilation, smoking with tobacco extract and the painting of sulphur mixed with linseed oil upon the pipes was recommended. One grower also recommended as a preventive against fungoid diseases spraying with a salt water solution at the rate of four ounces of salt to three gallons of water. This he applied, commencing about three weeks after the plants were housed, and kept up at intervals of ten days or a couple of weeks until March, when the spraying was done regularly.

## Lenox, Mass.

At the regular meeting of the Horticultural Society, held Feb. 20, the Rev. W. T. Hutchins read an excellent paper on the "Sweet Pea." There was a very good attendance, some sixty members being present. Messrs. Hoppe and Lemke, of Grand Rapids, Mich., exhibited a few blooms of their new scarlet carnation Morello, which was judged worthy of the first class certificate of the society. Mr. Charles Russell exhibited a well flowered specimen of Dendrobium nobile (diploma). At the next meeting on March 6 Professor Watson, of the Bussey Institute, will read a paper on "Some Native Trees and Shrubs That Should Be More Frequently Used in Ornamental Planting."

## Oceanic, N. J.

The second February meeting of the Monmouth County Horticultural Society was held here on Friday, Feb. 19. Every member of the society was in attendance in anticipation of the "smoker." Mr. Patrick O'Mara, of New York, was the guest of the evening, and lent material aid to the members of the Committee on Public Exhibition by his suggestions. An American Beauty rose of remarkable size and beauty was exhibited by Mr. Wellington Kennedy, of Red Bank, and was pronounced by Mr. O'Mara to be the finest he had ever seen. At the conclusion of the meeting the president introduced the artists who were to furnish the evening's amusement. The date of the next meeting is March 5.

"FLOWER QUERIES" New book on floriculture 10 Chapters, written in questions and answers, discussing 500 floral topics. Price, 25 cts. The COURIER, Box 4, Chatham, N. Y. Mention American Gardening when you write.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\*. We cannot undertake to reply by mail.

### SWEET PEAS, EARTHING UP.

(When sowing sweet peas on the gradual filling in plan—I mean covering the seed about one inch deep at first—how high should plants average when second inch of earth is added? When adding this (second) inch, and at succeeding fillings in of earth, it seems impossible to avoid burying the lower leaves, as they are so near the ground. Does it do any harm? Very many of mine died last season after each filling was done by a careful gardener, who covered no tops of crowns. Is this common, and when this system is to be pursued should more seed be sown as an allowance for death of more or less of the young plants? Is it not just as well—it is certainly much easier—to add the second inch, and so on, as soon as a few plants show their tips? I tried this one season and had good success.—R. S. T., Mass.)

—The object of sowing peas in a trench is mainly to secure shade and moisture for the roots, and on light soils in an exposed garden may be followed to advantage; but where the soil is any way retentive and not apt to dry out rapidly the system is unnecessary, and, in fact, on some soils may be injurious. This may have been your case, or if not so the trench may have been too deep, or in adding the soil some of the vines may have got broken off or bent under the pressure of the soil, and in that way injured. It is always advisable to sow more seeds than vines are actually required.

### CHRYSANTHEMUM GROWING: ENGLISH VS. AMERICAN.

(I find Molyneux's book is an English work. Can the directions there given be followed in every respect in this country? Morton, in his book on chrysanthemum culture for America, constantly speaks of "terminal" buds, but makes no mention of "crown" buds. This has puzzled me.—Mrs. S. P. Adams.)

—The English work referred to was written by one who in the time when he was exhibiting was perhaps the most successful chrysanthemum grower in Europe, and he faithfully deals with his subject in his book, and in that way he is reliable. There are points, however, in which our American system differs from the English. In Great Britain, to make any kind of success, the plants have to be grown carefully for at least ten months, at least so as to get an exhibition bloom. In this climate the same result can be had from a cutting rooted in May. The reason is that here plants develop much more rapidly than they do there during the months of September, October and November. In England nearly all the plants are grown in pots, but bench or box system not being so much used. But even in this country some of the sensational blooms exhibited are so grown. Many of those shown by Mr. Powell or Mr. Russell, both of Millbrook, N. Y., are grown in either pots or small boxes. The roots are then under better control, and feeding can be applied more judiciously and a more deeply built bloom results. Commercially in this country the bench plan is practiced as being the cheapest and most expeditious, and the terminal bud is more generally used, there being only a few varieties that require to be taken from the crown bud. Probably Morton omitted to speak of the minority. Since the issue of his book, however, we have had a few kinds that are almost entirely taken from the crown. Yellow Queen is an instance.

### VIOLET DISEASE.

(To J. Soehrer, Ill.): Preventives: A clean, sweet atmosphere, carefully picking off the affected leaves as they appear and burning them. Remedies: None that are absolute. Syringing is practiced by some successful growers and condemned by others. Local circumstances have much to do with determining which is the best method. Details of cultivation will appear shortly.

### TO MAKE PASSION FLOWERS BLOOM

(I have grown two varieties of Passiflora for years in my conservatory. They grow readily, running all over, but never produce flowers. How can I induce bloom?—J. H. C., N. J.)

—Rest the plants a little and slightly check the roots. Give no fresh soil this season. This will probably induce flowering.

### MUSHROOMS IN CELLARS.

(Can mushrooms be successfully grown in cellars or vaults that were originally built for storing beer—temperature about 40 to 45 degrees? Vaults are dark except directly under ventilators. They are from 10 to 30 feet under ground and several hundred feet long, all nicely laid up with brick and stone masonry. In places walls are damp with moisture.—Phil Strubler, Ill.)

—The cellars mentioned should make excellent quarters for mushroom growing, but it

THERE is no getting away from the fact that Pure White Lead (see list of brands which are genuine) and Pure Linseed Oil make the best paint.

Properly applied, it will not chip, chalk or scale off, but will outwear any of the mixtures offered as substitutes. It is, therefore, by far the most economical.

**FREE** By using National Lead Co.'s Pure White Lead Tinting Colors, any desired shade is readily obtained. Pamphlet giving valuable information and card showing samples of colors free; also cards showing pictures of twelve houses of different designs painted in various styles or combinations of shades forwarded upon application to those intending to paint.

National Lead Co., 1 Broadway, New York.

Mention American Gardening when you write.

may be necessary to run at least a flow and return hot water pipe through the whole; three pipes would be preferable. A temperature of 48 degrees is about the lowest that can be allowed; 50 to 55 degrees more likely to guarantee quick and steady bearing. Of course, when the beds are in the temperature would be a little higher than the question suggests, so that the amount of fire heat required would be very slight. Sometimes heat is generated by heaps of warm manure. But we advocate the use of hot water as being more satisfactory.

### AS TO FROZEN PLUM TREES: POND'S SEEDLING FOR EASTERN MARKETS.

(I have 2,000 Italian prune trees five years from setting. We had a sudden spell of cold weather on Nov. 20. Although it was 15 degrees above zero, it was so early that it killed nearly every tree to within six inches of the ground. Would it be practicable to graft them, as I wish to change them to Pond's Seedling, which does very finely here, often reaching four inches in length? Do they find a ready market in Eastern cities?—H. H. Kings Co., Wash.)

—We think the most profitable plan would be to root out the old stock and plant afresh Pond's Seedling. The fruit is handsome, and if you can grow it to the size mentioned there would be no difficulty in disposing of the stock in Eastern cities if you can get it on the market in good condition. There are times in the New York market when any plums would rule low, but speaking generally for fruit of the high quality you name you should be able to realize good figures.

### SELF SOWN PETUNIA.

(In October of 1895 we sowed a large crescent of ground with Petunia seed. It was a perfect show of color all last summer. Will the seed dropped from the flowers be likely to produce another full bloom?—S. A. C. C., Pa.)

—There will be some risk about the seed, even supposing a sufficient quantity had formed and ripened. It will perhaps have reverted. We should advise making a new sowing for best results.

### PROPAGATING HELIOTROPE.

(To N. V. K.): To successfully propagate Heliotrope in winter and early spring a good brisk heat is necessary. The cuttings are best taken off old stock plants kept for that purpose, and the growths that root most readily are the small tips and side breaks. Fat, robust growths are apt to damp off in the sand, or any way, the foliage sags so that they make slow progress, while the partially ripened breaks and shoots keep up their foliage, a very essential feature in Heliotrope propagation.

### GRAFTING PERSIMMONS.

(Does top grafting (say at a height of two feet) of the Persimmon prove satisfactory? I want to graft Japanese on wild Persimmon. Which is to be preferred, grafting wax or clay?—J., Alabama.)

—The native American Persimmon (Diospyros Virginiana) is considered to be the very best stock for Japanese varieties. I believe that nurserymen generally use budding, but if grafting be preferred, I think that wax will be better than clay.—Dr. F. Franceschi.

**Insects on Crab Apple.**—(To A. J. G.): The twig you send covered with two lateral layers of overlapping "scales" has the eggs of the katydid on it.

SEE OUR UNEXCELLED

# PREMIUM OFFERS

....OF....

**Plants, Seeds, etc., in our issue of February 6th.**

Our premiums are offered with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will), he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers.

Every premium offered by **AMERICAN GARDENING** in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

In our issue of **February 6** we published Premium Offers, embracing a vast assortment of Standard, Fancy and Novelty Collections in Seeds, Fruits, Flowers and Vegetables, to which we invite the careful attention of every one of our readers, in the hope that, becoming interested, they will seek to earn these premiums and so increase our subscription list.

**The Premiums offered** are all of exceptional value; there is nothing bordering on the sensational in the various announcements, and great pains have been taken to secure offers from reliable growers and specialists. As we have previously stated, the publishers of **AMERICAN GARDENING** neither buy, sell, nor in any way do they trade in the stocks offered, except to mail the orders as received to the growers or dealers making the offers. This arrangement makes it satisfactory to our advertisers, who, in turn, being thus afforded an opportunity to introduce their specialties to likely new customers, at practically no cost for advertising in any of its ramifications, are thus enabled to give values which are unprecedented in the annals of Premium Offers.

**If you want a copy of our Premium List let us hear from you and we will mail you one.**

**STANDARD FLOWER POTS**

Send for our new price list with extra discounts. All of our pots from 7 in. and upwards have our Patent Excelsior Bottom, which is a great advantage, as it secures perfect drainage. A Full Line of Bulb Pots.

## The Old and the New.

We have pleasure in presenting herewith portraits of the retiring Secretary of Agriculture, Hon. J. Sterling Morton, and of his successor in office, Professor James Wilson.

The retiring Secretary was a native of the State of New York, and his ancestors were among the earliest of the New England Puritans. He is a graduate of Union

creasing the efficiency of the department, and has succeeded in having it attract more attention in Congress than ever before, and this is not the least complimentary thing which can be said of his administration. The bulletins and pamphlets issued by the department have been of inestimable value to the farmers, gardeners and fruit growers of the country. One of the most creditable features of his administration is his sturdy fight against the infamous vote-bribing seed distribution, which has done

FIG. 54.—HON. J. STERLING MORTON.  
(Secretary of Agriculture 1893-1897.)

College. His career as Secretary of Agriculture has fulfilled the expectations of his friends and at the same time has kept his political enemies busy. He has perhaps justified the statement that he "never forgets his friends, nor often allows his enemies to forget him." Whatever may be the individual opinion regarding the policy of the ex-Secretary it must be conceded that he has largely increased the importance and dignity of the Agricultural Department. He has reduced the expenses without de-

(Present Secretary of Agriculture.)

so much to demoralize the Congressmen, their constituents and the business of seed growing and selling. Although Mr. Morton will doubtless retire to his beautiful home in Nebraska, it is to be hoped that he will be frequently heard from in the prolonged and bitter struggle which will be required to finally abolish the iniquitous free seed distribution.

Of the new incumbent of the office there is as yet but little for us to say. Professor James Wilson comes into

office having a full and intimate acquaintance with the real wants and demands of those whose interests it will be his duty to watch. As a practical farmer working on advanced lines he has ably demonstrated the value of scientific farming, and as director of the State Experiment Station at Ames, Ia., he has been brought into actual contact with the work of stations, and his administration of the department should therefore be of much value in developing along proper lines the future work of station officers. In a previous issue (on page 88) we presented a brief sketch of Professor Willson's career. He has also served three terms in Congress, and six in the State Legislature of Iowa.

### Potato Tests.

made in your issue of Jan. 30, and that planters may choose varieties for planting this spring, if desired, I give the following report of varieties of potatoes tested on my grounds last year; but the reader will please bear in mind that this locality is not considered a good potato country, and that, because of having been sick from June until late fall, the potatoes suffered much neglect.

Had I been well I should have weighed the potatoes, but as it was I was forced to be satisfied with counting them. I expect to devote about three acres to the testing of varieties of potatoes this year, hence you may hear from me at some future time. The height or strength of the vines is given about in inches.

\*Indicates the tubers were extra large. \*\*Indicates "very" rough, "very" long, etc.

NAME OF VARIETY.	Height of vine.	Large tubers to hill.	Small tubers to hill.	Eye deep or shallow.	Surface.	Mature in weeks.	Form and Shape.	Color.

L. S. SPENCER, Pesotum, Ill.

Strawberry plants packed in alternate layers of moss, without being tied in bunches, have always given us the best satisfaction.

### West Virginia Horticulturists Meet.

Notwithstanding the general prevalence of low prices for apples, West Virginia horticulturists are not complaining. The State is at present divided into two important fruit growing regions. The Northern Panhandle, where the apple interests overshadow all others, and the Eastern Panhandle, in which the horticulture is more diversified, yet places its main dependence upon the peach, apple and grape. While these two regions have taken the lead in horticultural developments, the greater part of the State is pre-eminently fitted by virtue of its climate and location to horticultural pursuits. The following notes were gathered at the recent meeting of the State society.

#### Flowers as an Educator.

Mr. Hieble discussed his subject from a florist's standpoint, bringing it under these three heads: First, civilization; second, fashion, and third, literature and organizations of the nature of horticultural and floricultural societies. The progress of the florist's art moves hand in hand with civilization, and as the standards of living are elevated, so the fashion in flowers and plants change. These changes and advances are made available to the general public through the medium of the press and public discussion.

#### Opposed to Budded Trees.

Mr. Charles Becker, of Millville, said: "In the spring of 1887 and 1888 we planted five hundred acres of fruit trees and grape vines. This was a large venture, for at that time comparatively little was known of the sorts best suited to the locality; we concluded to plant and experiment on a large scale, so that in case one class of fruit failed, we would have large quantities of those that succeeded. The fifth year we had a good peach and grape crop, the sixth

year there was a heavy peach crop all over the country, and no money was made, in the seventh year a great many trees among the peaches, apricots and plums were failing in vigor; and as this was common to all trees on rich soil, as well as those on poor, I was puzzled for more than a year to know the cause. \* \* \* One day, while in a deep study about what could be wrong with the orchard that had for four or five years been so thrifty and was now going out, I happened to remember of one day in 1891 standing in the apricot orchard admiring the handsome trees. \* \* \* I heard something fall. Looking about, I could see nothing; there was no wind blowing, but I was positive I heard something fall. I went some distance into the orchard, when I saw an apricot tree in perfect foliage lying upon the ground. Upon examination, I found the tree had broken off at the bud. The fracture looked as if the tree had only been glued to the stock, both parts being smooth and no indication of a union in the wood of the two parts. During the same season I found several others broken off in the same way, and all were of one variety of Russian Catherine. I consulted a nurseryman about it, but as he gave no satisfactory answer, the matter rested until the spring of 1896 upon the day above referred to. I then examined the trees around the collar where they were budded, and I found that when a tree did not look healthy it was rotten at the collar at the point of union with stock and bud; and upon digging up such trees I found a healthy root, the tree dying from the bud up. \* \* \* It is my firm opinion that orchards of budded trees are short lived. After one or two heavy crops the drain is so severe on the tree that if there is not a perfect union the tree soon succumbs." As a substitute for budded trees, Mr. Becker proposed to use only piece root grafted trees in this way, eliminating the objection to the budded and crown worked trees, and at the same time placing the tree more completely upon its own root.

#### Strawberries.

Mr. Vandervort, of Morgantown, emphasized the importance of grading the fruit as it is gathered, and as the season advances raise the standard of the grades rather than lowering the price.

"Structure of Some of Our Common Fruits" was dealt with by Professor Rumsey, of the West Virginia University.

#### Scale Insects.

Dr. A. D. Hopkins, entomologist of the West Virginia Experiment Station, called attention to the distinctive characters of the scurfy bark louse, the oyster shell bark louse, and the San Jose or pernicious scale, and their distribution in the State. The San Jose scale had been found in five localities, into each of which it had been introduced from a New Jersey nursery. So far as could be determined, the scale had been eradicated in each of the infested localities by the heroic measure of cutting and burning the infested plants. From a study of the life zones of the State, Dr. Hopkins was able to point out the regions where the scale was likely to become established, i. e., that portion of the State adjacent to the Ohio River, and the lower valleys of its principal tributaries; also a large portion of the Potomac Valley in the eastern panhandle; or, in other words, the area lying below an altitude of 1,000 feet above tide. Fruit growers were requested to keep a sharp lookout for the pest in these localities, and if it was found, the grubbing up and burning of the infested trees was recommended as the only safe remedy. Legislation to prevent the introduction of the pest from nurseries, and its spread in the State, was discussed at length by several members, and it was concluded that the State could accomplish very little in this direction unless the Federal government took some action to control interstate commerce, and the following resolution with reference to this phase of the subject was adopted:

Resolved, That it is the sense of this society that Congress should enact laws as will tend to prevent the distribution of the San Jose scale and other dangerous insects through interstate commerce, and that States should enact such uniform supplementary laws as will eradicate these pests where they have already become established.

The Manchester Strawberry is not heard from very often now, but it used to grow some very large crops of fruit on heavy loam when well cultivated.

**Commercial Orchards.**

Hon. Alex. Clohan of Martinsburg brought out the advantages of this State for commercial fruit growing, laying particular stress upon its climate and geographical situation. He then described the evolution which has taken place in the methods of pruning commercial orchards within the last quarter century, pointing to the superiority of the low-headed tree. The peach, he mentions as the "favorite" fruit for that locality; the soil and exposure of the mountain region seems to be especially adapted to this fruit. The favorite tree for planting, among the peach growers, is a thrifty yearling; during the first season after setting the orchard is kept in some hoe-crop, such as corn; after this the ground is entirely given over to the trees, but cultivation is kept up as long as the trees stand. The pruning practised has two objects: To keep the tree thinned and at the same time headed in. Profits are variable; one peach orchard of less than 100 acres, that was planted as a venture on virgin soil, returned this year (its first crop) over \$15,000. What is now needed is further experiments to determine the limits of the peach belt in this State.

**Methods of Propagating Fruit Trees.**

Under this title, Professor L. C. Corbett of West Virginia University discussed the weaknesses that are liable to arise in trees either from budding or crown graft-

**The Fruit Garden.**

**Plum Trees.**—Keep an eye open for caterpillar nests. The pruning should be done as soon as the weather moderates. There will not be much required if the trees are bearing freely, except to remove any branch that is growing across another. Pruning of the trees before bearing time requires judgment, otherwise the probable result after three or four years will be a mass of foliage, through which it is impossible to see in early summer—that is, if the trees have had liberal treatment (which is requisite for all fruit trees).

**How to Prune.**—That judgment referred to consists in cutting out entirely all surplus shoots instead of cutting back all the summer growth at one-third or one-half the spring pruning. There is too much of this systematic annual pruning business done. We get hold of a young tree and half starve it to keep it in subjection, and by working with the knife fill up the center with half ripened wood, until the tree has exhausted its feeding ground. Whereas by letting the necessary shoots extend spurs will form almost the entire length. We had this summer trees of Schuyler, Gage and Lombard, with arms six to eight feet long, actual ropes of plums. Perhaps the best way to make my meaning plain will be to give figures taken from a Smith Orleans tree planted six years.

FIG. 56.—BEAN CREAM VALENTINE. (See page 157.)

ing. The weakness that is shown in the trunks of some varieties of apples, plums and apricots was mentioned as liable to lead to the abandonment of such varieties, yet by a system of double working such varieties can be perpetuated.

The next annual meeting is to be held at Martinsburg in the month of October. E. C. Burkhart is president and Professor L. C. Corbett, West Virginia University, Morgantown, secretary and treasurer.

**Massachusetts Fruit Growers' Association** will hold its third annual meeting at Horticultural Hall, Worcester, Mass., on March 10 and 11. "Peach Yellow," "The Commercial Side of Fruit Growing" and "Small Fruit for Market," will be subjects of discussion. The secretary is S. T. Maynard, Amherst, Mass.

**Locality.**—As a rule, varieties do best in localities where they originated, and seedlings from any sort which has a fixed character in the same soil and climate are the best new fruits to plant for experimental purposes. Most of our best fruits in cultivation have such origin, and were given extensive trials through local tests, and extended their claims among neighborhoods for years before they were widely tested. The work was local.—W. M. BOMBERGER.

An average branch in the summer of 1894 made a growth of 38 inches, from the top of which grew in 1895 two shoots, 30 and 24 inches respectively. No extra shoots were produced in 1896, and only a growth of 8 inches from each point. On the 38-inch growth there are now twenty-eight spurs; on the 30-inch thirty-one, and on the 24-inch thirty-four spurs.

The following is from a tree of Washington of the same age: In 1894 growth 36 inches, producing from the points in 1895 three shoots, measuring 29, 32 and 24 inches, which, in 1896, gave no extra shoots, only a growth from the points, of 13, 13 and 12 inches. The number of spurs on the 36-inch growth, 20; on the three shoots from it, 17, 31, 18; showing that it is not necessary to cut back the growth to induce spurs.

The foregoing figures also show a decreasing growth each year after the trees commenced bearing, which will continue until there is very little noticeable wood growth—in fact, a tree of Coe's Golden Drop of the same age has reached that point, which means manure will be necessary in the future to keep the tree in first-class condition.

Don't forget to add "no substitution" to your order list.

**Peach Trees.**—Don't rush the pruning until the severe weather in your locality is certainly over.

J. HOLLOWAY, R. I.

**The Vegetable Garden.**

**Season Advancing.**—The time has now arrived for increased activity in the garden, and as the pressure of work increases, if it be not kept well in hand, something is liable to be overlooked, and as early crops of vegetables are mostly appreciated, no pains should be spared to attain them.

**The hurrying of seed sowing** before the ground is well prepared and warm, does not insure the earliest crops; the best cultivators are guided in these matters by the location and the condition of the soil. It is better to wait a few days than to sow any seed before the soil becomes warm, and in the right condition for working. A little care in this respect will insure better germinating results.

**Hot Beds.**—The hot beds should be in full swing this month, freely ventilated every fine day and carefully protected from frost. In this way the temperature should be kept as equable as possible, avoiding all sudden changes. The sashes should be opened a little as early as the sun shines upon the glass, and closed early in the afternoon, to "bottle up" the sun heat. Lettuce in different stages of growth for successional transplantings, should be coming along; also, radish, spinach, etc.

**Beets, Early.**—A sowing of the early Egyptian Beet made now in the hot bed, will make nice young plants for transplanting outside as soon as the weather is settled.

**Leeks.**—These are among the hardest vegetables in cultivation, and very useful for culinary purposes; good cooks frequently using both tops and bottoms. A few seeds sown in March in the hotbed or in the early border, as soon as the weather is favorable, the plants, when ten inches high, transplanted into trenches six inches in depth, and heavily manured, will give a crop. Make the trench wide enough to plant double rows ten inches apart.

**Kohlrabi.**—A few seeds of this sown now as directed for leeks and transplanted in the garden, will be fit for early use. It is a desirable vegetable when used young. Withstanding cold weather and drouth admirably, and not so subject to insect enemies as the turnips, and growing also in such places where it is impossible to grow turnips, it is advisable to plant this.

W. M. EDWARDS, R. I.

**Chrysanthemums.**

**Propagation.**—This is probably the best time to propagate the bulk of the plants for pot work. Old stools are beginning to move and should be kept a little warmer, say 50 degrees, at night. It makes the cuttings root more quickly. When you run across a plant that is yellow, avoid it though you may be short of that particular variety. Yellow foliage like the poor will be always with you, and will always crop up when the plant gets too much water.

**Cuttings that were struck** in December and January for specimen plants should be kept moving on gently. In potting them a little burnt vegetable refuse thoroughly mixed with the soil will put the gloss of health on the leaves as nothing else will.

**Our ideal pot plants** for exhibition flowers are struck now, and finally, in May or June, potted in a 9 inch pot and three shoots taken up. Flowers from these are superior in every way to those from a June struck plant in a 6 inch pot.

**Did you ever try** the English method with some of the slower growing kinds by rooting now and growing right along without pinching? Mrs. H. Robinson and Major Bonnaffon are two that will give superb flowers that way and will amply repay a longer season of growth.

**Novelties.**—Go easy on propagating. There have been others that did not live up to their records after the first year.

C. TOTTY, N. J.

## Grape Growing Under Glass.\*

(Concluded from page 50.)

The temperature should not be kept too high at first. I consider 45 degrees by night quite high enough, but, as it is desirable to keep the house as close as possible at this stage, it will do no harm to allow a rise of 20 degrees by sun heat. The temperature should be gradually raised, so that by the time the shoots appear it will be ranging from 55 to 60 degrees at night, with a rise of 15 degrees during the day. A little air must now be admitted on every favorable occasion to help strengthen the growths.

Most of the surplus shoots are removed as soon as the strongest can be selected for retention, but with some varieties (such as Barbarossa) that are somewhat shy fruited, it is better to leave plenty on until the fruiting shoots can be distinguished. With the variety just mentioned the strongest shoots are just as apt to run blind as the weaker ones. Tying down should not be attempted too soon, as there is nothing gained, and great risk of breaking incurred.

At this stage it is well to keep a sharp outlook for mealy bugs, as any that have been left will now begin to leave their hiding places; it will repay to go over the vines every second day, for if one bug escape now it will mean the presence of hundreds before fall.

Pinching will need seeing to after the shoots are long enough. I stop the main shoots two or three joints beyond the fruit, according to their strength, and the lateral growths as they appear are stopped above the first leaf. At first it is necessary to go over them about every two weeks while the rapid growth continues, then occasionally through the summer until toward the end of the season, when, I think, it is better to let them ramble a little.

A very important point is judicious watering. The amount to be given must be controlled to a great extent by the mechanical composition of the soil; should this be of a loose, porous nature a larger supply is required; if close and retentive less will be needed. In either case watering should stop when the grapes begin to show the least color, and should not again be given until after the fruit is cut. It will often be necessary to give a good watering then to avert the danger of the roots becoming too dry during the resting season. A point on which opinions widely differ is syringing; some growers believe in continuing this up to the time of coloring, and contend that this is necessary for the keeping down of thrip and red spider, but my opinion is that this practice rather produces than prevents, as it weakens the foliage and leaves it more susceptible to the attacks of insect pests; then syringing must necessarily be stopped, for it also injures the bloom of the grape, which is very easily disturbed during the early stages of its formation. Syringing ought to be discontinued after the grapes are set. An occasional good syringing may be given after this should red spider prove troublesome. A bright day, when plenty of air can be given, should be chosen, so the water can be quickly dried from the bunches and little harm will be done to the bloom, as once this is fixed, it will help to shed the water from the

berries, provided the water does not strike with full force on the bunches. During the setting period the atmosphere of the house should be kept as dry as possible. It is a good plan to run the temperature a few degrees higher then and to shake the rods occasionally during the heat of the day, to distribute the pollen.

The cutting away of the surplus bunches is an operation that requires considerable judgment, together with a thorough knowledge of the variety in hand, though the gardener cannot always use his own judgment and do as he pleases in this matter. The employer sometimes insists on having a heavy crop, and in consequence the "finish" of the grapes is sacrificed.

Finish is the end that every gardener strives to attain, but if the vines are compelled to carry too heavy a crop it is impossible to obtain the coveted perfection of color, richness of bloom, large, well-formed berries and good flavor. The vines can certainly be assisted in bearing their heavy burden by liberal feeding, but grossly fed vines never produce properly finished grapes. As the varieties vary so much in vigor and size of bunch, it is impossible to lay down a hard and fast rule as to the exact number of bunches a rod ought to carry. Many consider that one pound to every foot of fruiting cane is amply sufficient, and, generally speaking, this may be taken as a good crop, though some of the more vigorous growers are capable of carrying even more.

Thinning comes next in rotation; as a rule we are always anxious to make a start at this work as soon as possible, as a few days make such a difference in the size of the berries, but it is a mistake to start too soon with some varieties, muscat of Alexandria, for example, some of the berries of which though appearing to set at first stop, swelling at the stoning period. So it is better to wait until the non-stoning berries can be detected, which, by close observation, can be done before the majority have attained the size of small peas. Other varieties, such as Black Hamburg, Buckland Sweetwater, etc., can be thinned at a smaller stage, as they stone much more freely.

A second thinning is often found necessary, but it is well to do it all at once, as it marks the berries to work at them after they have attained any considerable size; but it is by no means an easy matter to strike it just right, even the most experienced being apt to make miscalculations. The thinner must be guided to a considerable extent by the variety he has in hand. Varieties such as the Frontignans, with short, stiff fruit stalks, require considerable more space for the individual berries than do such as Black Hamburg or Barbarossa, the fruit stalks of these latter being longer, and the general frame work of the bunch being loose and open they require to be left sufficiently close, so that one berry will help to keep the other in position; then when the bunch is cut it will keep its shape. Grapes intended for late keeping should be more vigorously thinned than those to be used during the summer, and though it is better to have the berries from the inside of all bunches well cut out, this is especially desirable in the late keeping varieties.

Ventilation is one of the most important details, and one that requires very strict attention, especially during the spring months. The extremes caused by the increasing brightness of the sun on the one hand and the cold

air on the other make it a matter of considerable difficulty to regulate the temperature of the house and at the same time to avoid cold draughts. At that season the airing is best done as much as possible from the top. As the season advances and the extremes become less marked, the trouble is considerably lessened, but when coloring has commenced and it is necessary to have a little night air on, then the greatest danger from mildew arises. I find that it generally makes its appearance during the prevalence of easterly winds, and by leaving air on at the west side only the danger from this source is materially lessened. The leaves become harder in texture toward the end of the season, and are less subject to the attacks of mildew. More night air being then required for the ripening of the wood, it can be given with more safety, but it is not advisable to leave full night air on until after the fruit is cut.

The number of varieties now in commerce is so large that it is needless here to go into their individual merits. Were I confined to two varieties, one black and one white, I should certainly choose Black Hamburg and Muscat of Alexandria. We often see these two grown together in an early house. The black is all right, but for early work, if a white grape be wanted, I would prefer to substitute Buckland Sweetwater, as it ripens from two to three weeks earlier, which means a great deal at the beginning of the season. For the second house, or what may be termed the general crop, Muscat of Alexandria, Muscat Hamburg, Mrs. Pince and Black Hamburg are all excellent varieties. For latest house, with a view to keeping, Lady Downe's, Black Alicant and Barbarossa are well suited. To give these varieties justice and enable them to properly ripen their growths, they must be started not later than the first of April. These varieties will hang in good condition for a considerable length of time after they are ripe, but should be gone over occasionally and any decaying berries removed. When deprived of their natural shading by the falling of the leaves the bunches had better be cut.

The method of storing most generally practiced now is what is termed bottling. To accomplish this it is necessary to cut the bunches with a foot or more of the shoot attached, and the end of the shoot is inserted into the neck of a bottle of water. Some use a few small pieces of charcoal in the water to help keep it sweet and prevent the necessity of frequently changing. The bottles are fixed in racks with enough slope, so the bunches will hang clear. A perfectly dry, dark room, where a temperature of about 40 degrees can be maintained, is a most suitable place for storing.

**American Forestry Association** at its annual meeting, held at Washington, D. C., elected as president Francis H. Appleton of Boston, Mass.

**Portage (O.) County Horticultural Society** held its nineteenth annual meeting at Ravenna, Feb. 17. The following officers were elected: Frank Ford, president; A. D. Olin, vice-president; Andrew Wilson, secretary; W. A. Hammond, treasurer; A. J. Jennings, T. B. Dickinson, L. Smith, executive committee.

**Arkansas State Horticultural Society.**—The annual meeting and exhibition of this society will be held at Little Rock, May 12, 13 and 14.

\*Lecture before the N. Y. Gardeners' Society by William Scott.

## Lawns and Potash.

I have read with interest Lawns and Potash, in your issues of Feb. 6, by Mr. John Shore, and Feb. 20, by Mr. Gomersall. I agree with both in regard to the value of potash as a lawn dressing, but why not give a good square meal when you are about it? A lawn needs plenty of feeding to back it up against the dry summers and severe winters with which it has to contend, and I think the results will amply repay the little extra outlay involved.

A formula which I used last spring with good effect, was nitrate of soda, 500 pounds; tankage, 790 pounds; dissolved bone, 350 pounds; muriate of potash, 360 pounds. Wood ashes are, I think, an expensive manure, considering potash as the principal manurial constituent. The ratio varies so much. The virtue of wood ashes depends greatly on the kind of wood burned, and also how they are handled before getting to the gardener or farmer.

The average ton of wood ashes does not analyze more than 4 or 5 per cent.

he would employ as a top dressing for a lawn, either as a mulch or as a fertilizer. I cannot agree with him as to their being of such value as a top dressing for lawns. They have very little virtue as a fertilizer, and, I think, even less as a mulch. If put on heavily enough to be of any benefit as such, they will certainly injure the grass.

I would prefer to use some good rotten manure, putting it on in the fall, thus killing two or three birds with one stone, as it were, by feeding the lawn, mulching it for the next summer and at the same time incorporating humus with the soil, to help retain moisture. I have seen coal ashes used with good results, on heavy clay lands, but doubt whether they can be used to as good advantage as a good dressing of stable manure, black swamp muck, leaf mould, or anything rich in humus, and in which stiff or clay lands are usually deficient.

A few words on the treatment of the lawn resembling a "pavement or stubble field." My plan would be to plow and summer fallow it, working it on every chance possible to get it clean,

## Novelties of the Season.

(FIFTH SERIES.)

*The descriptions given are those of the introducers.*

### Pea.—Fig. 50.

This variety is 2½ feet in height; the vine is robust, and the foliage is large and vigorous, of a light green color, closely resembling Telephone in general appearance, though dwarfer, and it is very much earlier. The pods, which are as large as Telephone, are produced singly and in great abundance, and are well filled with from six to eight peas of enormous size, but its chief value lies in its earliness, and when we consider that a pea so large and as rich in flavor as any of the later wrinkled sorts can be had three days after Henderson's First of All, its value can be readily seen.

### Cream Valentine Bean.—Fig. 56.

This variety presents improvements different entirely from those of Black Valentine, and is distinctly superior to its parent, the Early Red Valentine. The plant is considerably larger than the old Valentine, though it may be planted at exactly the same distance. It preserves all the characteristics of its parent, particularly in the absence of stringiness. The pods are borne in enormous quantities close to the center of the plant, and are not only longer but much thicker and more meaty than any of this type. Another advantage which will recommend it to all is that the beans retain their tenderness much longer than any other variety.

### Mignonette Lettuce.—Fig. 57.

This is a small, sturdy, russet colored Lettuce, distinct and unique, and of great value. The entire plant measures only seven inches in diameter, and is more solid and compact than any existing variety. The outer leaves are few, and these cling so closely to the head that it is almost all head. The few outside leaves are as deeply crumpled as a Savoy Cabbage and richly colored with russet red and bronze green of varying shades. The cut section shows the character of the solid heart, which is of a creamy yellow waved with pale greenish white. It is wonderfully hardy, resists drought and excessive moisture—a most valuable feature in our climate. It is fit for use five days after Boston Market, which, combined with its long standing character, constitutes it an all-seasons variety.

*From the catalogue of Peter Henderson & Co., New York.*

### Australian Brown Onion.

This is a new variety from Australia, where it is grown in preference to all others, and practically every grower confines himself to this one variety. The Onions are flat, but thick through, of a light brown color with white flesh. They are extremely early in ripening, not making any stiff necks or scallions.

### Fordhook Pickling Cucumber.

This is wonderfully prolific, and may be termed a continuous bearer. Its most valuable characteristic is its habit of keeping up its supply of pickles after such varieties as Green Cluster, Jersey Pickle, Early Frame, New Everbearing, etc., have quit setting on.

*From the catalogue of W. Atlee Burpee & Co.*

FIG. 57.—LETTUCE MIGNONETTE.

of potash, with a little phosphoric acid, and the price ranges from \$10 to \$14 per ton, which you pay for 80 or 100 pounds of potash, the commercial value of which is \$5 or \$6 in the form of the sulphate or muriate. Of course if one has the fire heap Mr. Gomersall speaks about, where weeds, hedge pruning, etc., are burned, and if the quantity will guarantee the trouble, it will pay to spread the ashes from such a heap on the lawn or elsewhere, rather than let them go to waste. But the question is, how much of this refuse must be burned before you get sufficient ashes? If it be intended to burn on the same heap, for any length of time, with the idea of accumulating a quantity of ashes, and the heap be left exposed to heavy rains, I am afraid the fertilizing qualities of the ashes will be reduced to a minimum, and I don't think there need be any fear of them burning anything. I burn 100 to 200 loads of tree trimmings in the course of the year, and when I get through I can put the ashes in a very small space.

Mr. Gomersall, himself, makes the same mistake as that for which he calls Mr. Shore to account, namely, not stating what quality of coal ashes

then with a good subsoil plow well loosen the bottom, give a good dressing of manure, plowing it in, work the surface down smooth preparatory to sowing the seed, which should be done from the 1st to the 15th of September, using a lawn mixture from any reliable seed house, at the rate of 4½ bushels to the acre, giving a good rolling with a heavy roller, and after the ground gets frozen up, a coat of manure. Everything else going right, this will give a good permanent sod and at less expense than it would be to adopt the method advised by Mr. Gomersall. T. HARRISON, N. Y.

**Is It a Fact?**—A potato grower says if you throw the furrow from the north side of the row you make a shade in which if you drop your seed, it lies for a long time before warm enough to germinate. His plan is to prepare the ground thoroughly, plow deep, manure well; lay off east and west, drop your seed and cover on the south side of the row, covering about two inches deep. This forms a bank of earth just the right shape to catch the sun's rays and produce germination.—The Farmer, Dallas, Tex.

**Armenian Relief Fund.**—A number of orange growers on the Pacific Slope put up a car load of oranges (329 boxes) which was sold in New York for the benefit of the Armenians.

# AMERICAN GARDENING.

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1894.

PUBLISHED BY

A. T. DELAMARE PTC. & PUB. CO. LTD.

ROSE AND DUANE BROS.,

BRUNSWICK BUILDING, NEW YORK.

Telephone, 1154 Cortlandt.

P. O. Box 1897.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**A Question and a Thought.** THE necessity for a thoroughly understandable code of description to be used by those who make the catalogues is impressed upon us the more we look into some of the productions. Many compilers run so exclusively on superlatives as to positively defeat their best interests; for a continual outpouring of such qualifications as "superb," "most remarkable," as to quality or effect, and "deepest" or "most intense" as to color, are only of value to their users when employed with careful discrimination. It is purely folly for one to put extravagant adjectives to all the objects offered for sale. The only conclusion to be made is that it is assumed that the buying public is composed mainly of fools, and while it may be an accepted truism that the "public" is to be so described, it is worthy of a moment's thought that the seedsmen and plant dealers are not appealing to "the public," but to a portion of it only, and that portion composed of individuals of fair intelligence.

It is a noteworthy sign of the times that those concerns which have in the past been notorious for the false impressions conveyed by their catalogue descriptions and illustrations are either greatly modifying their tactics, or are slowly but surely being relegated to the bottom

of the list of available houses from which to purchase, a natural sequence in these days of an enlightened horticultural press. It is again an illustration of the old adage: "Slow and sure wins the race."

We have been led thus to animadvert by the perusal of a letter from a correspondent who asks, and very reasonably, too—

What do the terms "good bloomer," "free bloomer," "copious bloomer," etc., mean as applied to Hybrid Perpetual Roses? Do they mean that the Roses mentioned give "free" or "copious" blooms, in relation to quantity, during their regular flowering season (June), or that "free" or "copious" signifies that the flowering is prolonged through the fall and summer?

We are forced to confess our inability to solve the points raised. If our lethargic Rose Society were a body of merit and deeds, here indeed, were work for it to undertake; the compilation of a classified and systematic Rose list; but such a hope is vain. The Society has no sympathy with the Rose, except as a commercial plant. Is it impossible to arouse any live interest among the amateurs of America to move them to act in the organization of a genuine Rose Society, one where the Rose shall reign; not the dollars and cents that a few may squeeze out of her?

## DEATH OF LUTHER TUCKER.

It is with deepest regret that we have to record the death on Feb. 23 last of Luther Edward Tucker, senior editor and proprietor of the "Country Gentleman" of Albany, N. Y. Our late brother was in his 63d year and was born at Rochester, N. Y. His career has been one of unremitted hard work and conscientious endeavor.

## DEATH OF E. W. HERENDEN.

On Feb. 23 Edward W. Herenden, president of the Herenden Manufacturing Company, died suddenly at Geneva, N. Y. Born at Farmington, Ontario County, N. Y., on July 21, 1831, he graduated from Harvard, and was for a term of three years a schoolmaster, but entered into the business of a nurseryman at Macedon, N. Y., in partnership with the late J. J. Thomas. After one or two changes in the nursery business, Mr. Herenden formed the Thomas Harrow Company in 1874, which in 1886 was succeeded by the Herenden Manufacturing Company.

**Free Farm Labor Bureau.**—In order to assist the thousands of unemployed men in Chicago, the Workingmen's Home, at 42 Custom House Place, has established a Free Labor Bureau, and is prepared to furnish men to farmers and others in all parts of the country without expense to either. Employers applying should state definitely as to the kind of work, wages to be paid, and if railway fare will be advanced.

**Plans for public grounds.**—"Many citizens enter the Park Commission who know enough not to venture upon originating plans for parks, but an inexplicable number of them don't know enough to understand that alterations in public places demand as much deliberation by competent authorities as when places of that sort were first made. The idea that there is anything in a 'plan,' and that the design of a public place requires a higher quality of thought and training than can be supplied by an engineer or paving contractor, is something which has to be learned even by men selected for the honorable and delicate task of guarding the city's parks."—N. Y. "Sun."

## The "Best" Variety.

Why do not some of our extensive growers who have been experimenting and testing for years tell us definitely what is the best early, medium and late peach, pear, strawberry and other kinds of fruit? What is the best variety for sandy soil, clay and loam?

These questions have been never-ending themes for argument and discussion at all our horticultural meetings and in the agricultural press for years, yet the problem is no nearer being solved than at the beginning. Nobody can answer the question now, and it probably never will be answered definitely.

What is a good variety? This is an easy question. It is not so well-understood as it should be that when a plant or tree bears fruit it is simply breeding, or multiplying its species, and the pulp forms only for the seeds to grow in and assist their distribution. Some varieties will bear seeds without developing the pulp beyond a limited extent, and often impart to it a bitter flavor and woody texture. Such a variety we discard as worthless. Only about one in 10,000 seedlings will be an exception to this rule.

We may, then, define a good variety as one which possesses the ability to withstand the most unfavorable climatic conditions, is full of breeding or fruiting stamina and has a tendency to develop a large amount of pulp in seed bearing and imparts to it a delicious flavor, good texture and desirable color.

Individual plants behave differently under different conditions and treatment, hence their pedigree or history is always essential to success. What stock breeder would be content to know that his Jersey was a thoroughbred? He must know the individual points of excellence and whether they come to her by chance or through a long, scientific system of breeding to build up good qualities and eliminate defects. Horticulturists are just beginning to recognize the importance of these laws in plant breeding.

Plants have a passion for breeding, and if not kept under control, limiting them to their ability to reach perfection in seed bearing, they rapidly retrograde and become wholly or partially impotent; hence, it is equally important that we should know the history of the plant and its present ability in this direction.

Then, again, plants are much like the human family. They have their affinities, with strong likes and dislikes. There are people who really enjoy strong tobacco, garlic, limburger cheese, blood puddings, etc., while many others would cease to exist if compelled to feed on such fare, or, at least, they would not flourish on that diet. So in the soil the plant finds something of which it is especially fond, and grows fat, while the same ingredient is offensive to another sort, and so it pines away, but may find the congenial soil near by and flourish wonderfully.

These deficiencies are found in clay and sand alike; hence, when any one asks us to say which one out of a hundred or more desirable varieties will do the best of all, we are forced to admit we don't know. On our own farm and under our method of fertilizing and tillage we can say a certain sort leads everything and another one is an entire failure, while a neighbor not a mile away reports exactly the reverse. The only way we can tell definitely is to make a trial.

There are many new and very promising sorts which are known to lead all others in certain localities, and when these are ascertained they are the sorts to set very largely. Every enterprising grower will be on the lookout and test highly commended varieties, and if, perchance, he strikes exact adaptability to soil and market, and then administers proper methods of culture and restriction to preserve and accumulate good qualities, success is assured.

Out of many millions of people who have lived and died, only a very few have possessed qualities of brain and brawn which enabled them to leave their mark upon the world. The same is true of plants. Varieties come, and shine like meteors for a season, but, falling into uncongenial surroundings, disappear, and their places are taken by others. Out of this great host the number which have acquired nearly universal fame is less than a dozen, and yet, it is true, we are making wonderful progress in horticulture.

R. M. KELLOGG.

Three Rivers, Mich.

## To Preserve the Forests.

President Cleveland, on the recommendation of Secretary Francis and a Forestry Commission of the National Academy of Sciences, has signed and promulgated thirteen proclamations establishing thirteen additional forest reservations, containing an aggregate area of 21,379,840 acres.

The report of the Forestry Commission to Secretary Francis, and his report to the President, give interesting and valuable information concerning this important Executive act. An appropriation of \$25,000 was made by Congress "to enable the Secretary of the Interior to meet the expenses of an investigation and report by the National Academy of Sciences on the inauguration of a national forestry policy for the forested lands of the United States." Under authority of this act, and with the approval of the Secretary of the Interior, Professor Wolcott Gibbs (president of the National Academy of Sciences), appointed a commission, consisting of Professor Charles S. Sargent, director of the Arnold Arboretum at Harvard University; General H. L. Abbott, United States Engineer Corps; Professor William H. Brewer of Yale University, Mr. Arnold Hague of the United States Geological Survey, Mr. Alexander Agassiz and Mr. Gifford Pinchot, the president of the Academy, being ex-officio a member of the commission.

Together with previous reservations, the total area of secured forest land is now about 39,000,000 acres. The President could not have done any act which would be of more ultimate good to the country. Our forests must be preserved.

## Birds and the Garden.

President Nowlin of the Arkansas State Horticultural Society presented the following resolution at a late meeting of that body, and it was unanimously adopted:

Whereas, It is a fact well recognized among horticulturists that birds are the fruit growers' best friends, in the destruction of injurious insects, which annually injure and destroy a large percentage of our fruits and plants; and

Whereas, The amount of injury and destruction made by insects amounts annually to millions of dollars, and would largely increase, except for the friendly offices of insectivorous birds; and

Whereas, It is the patriotic duty of every horticulturist and well-meaning citizen to preserve and protect these little feathered friends and sylvan songsters, therefore

Be It Resolved, That the Arkansas State Horticultural Society favors and recommends the General Assembly of the State to throw the protecting arms of the law around these little friends of the farmers and fruit growers, and create suitable laws to accomplish that purpose.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**A Misprint.**—Let us get the botanical name of the Casabanana straight, if it takes all summer. It should be (as my authority goes) "*Secana odorifera*." My usual s's and i's may be misinterpreted now and then, it seems. Mr. Thomas Meehan thinks this may not be the proper name after all. Mr. Normand of Louisiana wrote me that "Dr. Morris of Kew" recognized the plant as entitled to that name. I believe the name *Benincasa cerifera* was applied to "Casabanana" at least once, but this was found to be incorrect. Let the final decision be what it will, we can go on and make ourselves understood by calling it Casabanana, as this common name will doubtless stand.—SAMUEL A. COOK, Milledgeville, Ga.

**A Pointer for Rockland County Farmers.**—Many years ago fine peaches were grown in this county; gradually they died out. The ground has had a long rest, just what it needed. Many of the farmers have a few acres of land to spare, and as they are not making any money, why not set some peach trees? The cost is but little; the market is near, and we predict that the venture will be a success. Choice late varieties will pay as well as any.—VIDI.

**A Suburban Garden.**—I notice in a recent issue of your paper, your elaborate offers in premiums, and I doubt very much if such have ever been equaled. And verily if any one chooses to take hold of your valuable offers it need not be long before he can sit under the shade of his own fruit trees and vines, and view his flowers and vegetables growing in their luxuriance. Many a one in a suburban home, no matter how small the plot, would be astonished what an amount of flowers, strawberries and vegetables can be grown, and especially by taking up the good varieties of such things as you offer in your premium list, and I firmly believe that they are all of them good. There have been in times gone by much trouble and annoyance in many suburban homes on account of trespass, and many a one who has planted a garden has been disgusted by having the fruits of the toil destroyed by dogs, chickens, or something of that sort. But at a small expense in the purchase of galvanized wire netting they can be kept out. This can be purchased in very ornamental styles, and with vines and creepers a small garden may be made a thing of beauty and a joy forever.—MARYLAND.

**Toy Incubators.**—Last year an enterprising dealer put upon the market what

might fairly be called a toy incubator, viz., a machine of about one-half the usual smallest capacity, at a very low price, and intended to catch the boys and girls. The idea was an excellent one, and that other manufacturers appreciate the fact is shown by two of them putting forth such machines for the coming year. Hundreds of these machines will be sold; and scores of them will be absolute failures, through the fact that they are not what they profess to be. One of the makes, claiming an almost absolutely even heat throughout the egg chamber (less than a degree of variation) showed an actual variation of 8 degrees between different portions of the same. This is mainly because the machine is single walled. No reasonably favorable results can be expected from such a machine. If you buy a machine for the boys, be sure that it is double walled, with a good air space between the walls, and that it has a first class regulator. Otherwise it will be merely

**Barberry as a hedge plant.**—On page 39 of American Gardening for Jan. 16 is a short note on "Barberry as a hedge plant for Iowa." In 1840, while at the Union Academy at Red Creek, Wayne County, N. Y., twenty-five miles from Oswego, I saw a beautiful barberry bush growing on the lawn in front of a minister's house. Large wheat fields were near. I was anxious to take home a sprout of the bush to grow. I expressed my desire to the minister. He said he would rather I would take the entire bush, roots and all, for he had been notified by the farmers that if he did not destroy it, they would commence suits at law for damages. The minister said the wind blew so long from one quarter, and so long from several others, and then pointed out to me the blasted wheat caused by the barberry bush. The barberry bush had caused many acres of blast for ten years. I hope the Iowa farmers will not use it if they wish to grow wheat near it.—C. R. EDWARDS, N. Y.

(It cannot be too largely known that the wheat rust fungus passes a portion of its life on the barberry.—Ed.)

**Ornithogalum Arabicum.**—Replying to the note on page 94 this can be planted in pots or boxes the same as hyacinths until taken in the house. The bulbs like the temperature to be rather warm—60 degrees at night and 70 to 75 degrees in the day time, and a place as near the glass as possible to prevent them from getting too opindly. I have bulbs in bloom just now, a beautiful, large, white flower with a black center and a distinctly aromatic odor. O. A. album is pure white, dark center; O. A. aureum, golden colored. O. thyrsoideus has yellow flowers in dense masses, from ten to thirty flowers, borne on an erect scape. There is the pretty little P. umbellatum, or, as it is called in southern Europe, Star of Bethlehem, that has escaped from the gardens into the meadows and has become very troublesome.—N. BUTTERBACH.

## Mushroom Growing Puzzles.

(Numerous attempts, following carefully prescribed methods, have failed to produce a crop of mushrooms. Last spring a bed made in the winter that had entirely failed was not removed, being out of the way; this autumn mushrooms appeared clinging to the walls, and wherever there was any moisture, watering and attention then (the bed had not had a drop of water for nine months) produced a small crop, and ever since there have been a few mushrooms coming now and then, i. e., for three months.

How is this explained? Was the growth spontaneous? If not, how could the spawn start when it did, having failed to grow under most favorable circumstances? Can you give me any rational explanation of constant failure?—W. I., London, Ont.)

—Mushroom growing is at times a lottery, and the action of the spawn and ultimate success or failure difficult to account for. If, as stated, the beds were so favorably made and situated, failure would have to be credited to the following, either individually or collectively: Poor spawn, it perhaps having been exposed to extremes of heat or moisture, and so damaged; the presence of some harmful ingredient in the manure, perhaps caused through the feed or phylis given to the horses; spawning at too high a temperature and the beds thus dried out. Very probably this, last is the case. Should that be so, read the hints given on pages 793 and 802 of last volume.

## Renovating Old Lawns—Bulbs in the Grass.

(In your issue of Jan. 2 Dr. G. H. Sadelson has an interesting article on "Ornamental Gardening," especially so about the lawn, on certain points of which I want information, viz.:

First—How should I treat old lawn before sowing seed and how much to one-eighth of an acre?

Second—We have a splendid water system. Is it wise to use water daily from hose and sprinkler?

Third—I use bone seed meal in the spring, about sixty pounds to one-eighth of an acre, and in, say, July about the same weight of cottonseed meal. What do you recommend as to quantity and frequency of these? I do not use manure at all. Is cottonseed meal merely a stimulant or is it a fertilizer?

Fourth—The doctor recommends leaving clippings of grass on lawn to mulch, etc. Does he mean to leave all the clippings during the whole summer?

Fifth—In front part of lawn, about 1,500 square feet, I have about 600 crocus bulbs in the sod. Do they hurt the lawn? It seems to me since they were put in that the sod is worse in the spring, more ragged and ground heaved up, than before.

Sixth—Should sod after sowing on it be heavily rolled? Could this be done while crocuses are getting above ground without hurting them?

Seventh—Should I add white clover seed to the fine mixed lawn seed we get from nurseries, and how much for one-eighth of an acre?—S., Pa.)

—If not prepared to dig up the lawn scarf it, in order to find lodgment for the new seeds; this can be done by thoroughly combing the turf with a heavy and sharp-toothed iron rake, or it may be gone over with a round-pronged steel fork and prised up in that way. Then sow about six quarts of good lawn mixture. If there be no objection to clover, eight ounces of white clover could also be sown. This last named makes a delightful green, but gets winter killed. After sowing the grass seed a dressing of fine earth is advisable. The time for these operations is immediately after the frost is clear out and the soil is slightly warmed. When growth has commenced use the

## AMERICAN GARDENING AND THE OHIO FARMER,

Both One Year Each for only \$1.60.

THE OHIO FARMER is a large, 32 page weekly, 24 per year. A National Farm, Stock and Home Journal, and is clearly the Leader of the Agricultural Press of America. It pays more for Illustrations, Correspondence and Market Reports than any other of its class. It is the Best and Cheapest means of advertising. Send for SAMPLE COPY to THE OHIO FARMER, Cleveland, O.

THE OHIO FARMER will start their paper the date the order is received by them, and continue to Jan. 1898—14 months. If ordered at once. Address all orders to

AMERICAN GARDENING, P. O. Box 1697, New York

roller instead of the mower, and repeat this for two or three weeks.

In watering we should advise flooding with the hose at intervals.

Cottonseed meal is a fertilizer rich in nitrogen.

It is well to leave frequent mowings on the ground if well scattered and not very long at time of mowing, but to leave all would be apt to cause trouble and become unsightly.

Crocus bulbs do not to any appreciable extent hurt the lawn, other than that after time of flowering they are a little unsightly. If rolled before flowering they would be damaged. Of course, when very numerous in one spot they would cause slight upheaval when beginning their growth.

### Fruit Growing in West Florida.

Having just returned from a brief visit of inspection to the West Florida Highlands, so called, I have thought perhaps your readers might be glad to know the opinions I have formed. We are apt to associate oranges, alligators and mosquitoes with Florida; but I was not in the orange belt, and as for alligators and mosquitoes, if they ever belong in that portion of the State included in my visit (and the local real estate men insist they do not), they were "under cover" while I was there.

It was deciduous fruit growing that I was especially interested in. My first stop was at De Funlak Springs, a place well known within Chautauqua circles as the seat of the Winter Assembly. Though the people thus drawn here are not especially interested in fruit growing, enough has been done to demonstrate the adaptability of the soil to fruit crops. This is especially true of certain pears of the Asiatic type—Le Conte, Kieffer, and Garber. The peach also does well. The fig is grown to some extent, but perhaps not as much as it deserves. Among our Northern grapes the Niagara seems to stand in the front rank, although it is claimed that many others do well. The great grape of the South, however, is the Scuppernon. But they cannot or do not send it to Northern markets. It is a very rank growth, and yields immensely, but must be used at home or marketed in some manufactured state, as wine, marmalades, jellies, canned, etc. The soil at De Funlak is rather sandy for the best results in horticulture.

Forty odd miles east of De Funlak there is more clay and less sand. This is on the divide between the two great rivers, the Choctawhatchie on the west and the Apalachicola on the east. Here the prospects for Northern enterprise in fruit growing seem better. Some Northern men of my acquaintance, of eight or ten years' residence, are meeting with encouraging success in growing the pear, peach, plum, quince (the Asiatic varieties), grape, etc. I have not seen such wood growth, not even in California, as they produce here. It is not uncommon to meet with annual growths of from seven to ten or even twelve feet on the pear, peach, plum, mulberry, etc., while the growth of the vine is almost beyond belief. But the great drawback here, as in other highly favored regions, is the long distance and expensive shipment to market.

The climate is admirable and health is unquestionably good, or the people have a happy way of disguising the facts, and I am fully persuaded that the man of energy could live comfortably in this section of the South.

Greencastle, Ind. W. H. RAGAN.

You may get over that slight cold all right, but it has left its mark on the membranes lining your throat. You are liable to take another cold and the second one will hang on longer than the first. Scott's Emulsion is not an ordinary cough specific, but it is "the ounce of prevention." It builds up the system, checks inflammation and heals inflamed membranes. "Slight" colds never bring serious results when it is promptly taken.

Book on the subject free.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### LITTLE GEM CALLA.

Almost everybody is out of patience with this tantalizing little thing, and this is just where the trouble lies. It needs patience, more patience, some one says, than the average window grower possesses. "Extra size" bulbs are now offered at double rates. Doubtless these are of blooming size, and offer some prospect of satisfaction. People fail to read between the lines, and when the glowing advertisement says that the dainty thing begins to bloom when only a few inches high, they forget to notice that it only grows a few inches high anyhow, and that therefore this does not necessarily mean that it blooms white very young. Patience, friends; this gem may repay you later.

### FAULTY BULBS.

Those who are wont to blame themselves for failures with bulbs may find a bit of encouragement in this experience. Several bulbs of a bunch-flowering *Narcissus* were placed in one pot, earlier in the season. All but one threw up flower spikes, and have been blooming nicely for two or three weeks past. The one exception, which was, apparently, as good a bulb as the others, has shown very little signs of growth till the present time. Now, as the others are just fairly out of bloom, this is showing a good flower spike. In this case we have proof that the variation was with the bulbs, perhaps through not being equally well ripened. Not always is the window-gardener at fault.

### THE FREESIAS DISAPPOINTING.

The California hybrid *Freessias* have been referred to as the most interesting thing in the whole collection. This being the case, it was a matter of course, that, if disappointing, they would be the most disappointing of all. Two pots of these were grown in comparison with two pots of home-grown bulbs, the four receiving exactly the same treatment. It will be remembered that the claims for the new *Freessias* were that they were larger and more fragrant than the older type, and in several new colors and combinations of colors. They were neither larger nor more fragrant; more than this, they showed no new colors, and no more variations in the markings than is common in the old forms. Of course, one does not expect form a dozen mixed bulbs to get an endless variation from the original type. But surely one has a right to expect something. In this case there was absolutely nothing in exchange for the double price paid for these bulbs because they were supposedly a marvellous advance upon the old sorts. One hates to chronicle such a fiasco. Who is to blame?

### BROODERS FOR EARLY CHICKS.

If one has in view early chicks for market, or early laying pullets for next fall's work, the chicks must needs be brought out soon. March for Asiatics, and early May for the early-maturing Mediterraneans, are the best months. The "betwixt and between" Americans may be hatched at almost any time between. Whatever may be the difference of opinion as regards incubators, those who have used brooders are almost unanimous in their favor. They save an endless outlay of time and strength, and if constructed upon right principles, will raise a larger proportion of the chicks than can usually be expected from hens. Some of the experienced ones say that the best time to raise brooder chicks is in early spring, before the weather gets too warm. On all up-to-date home plots some kind of a brooder will be tried this year, even if it be but a home-made one.

### EARLY ASTER PLANTS.

Those who are to raise the late, tall growing *Asters* during the coming season, must needs be stirring. They need a long season for growth, and the earlier plants always do the best. Inquiries were received concerning the fine "exhibition" *asters* mentioned last fall in American Gardening. These were sown in boxes

## "Mend it or End it,"

has been the rallying cry of reform, directed against abuses municipal or social.

For the man who lets himself be abused by a cough the cry should be modified to: Mend it, or it'll end you. You can mend any cough with

**Ayer's  
Cherry Pectoral.**

about the middle of March, transplanted once or twice, and transferred to the open ground early in May. Frequent cultivation and two or three applications of commercial manure were afterward furnished them. The conditions for success are within easy reach of all.

### ARAUCARIA EXCELSA.

If there is anything that could so satisfy the mind that has a symmetrical leaning as a well-grown houseful of *Aracaria Excelsa*, I do not know what it is. One of the best experts in growing decorative stuff in this country tells me that this is one of the finest of house plants; hardy, long-enduring and always satisfactory. It is not much known by the people at large, and I have never yet seen it in a window collection. In appearance it is much like a tiny Christmas tree, delicately beautiful, and of perfect symmetry of form. It is sometimes called Norfolk Island Pine. Unfortunately, it has never yet been obtainable at a low price. The cheapest pricing I have ever seen put upon it at retail appears in one of the present season's catalogues, where plants less than a foot high are offered at \$1 each.

### CHLIDANTHUS FRAGRANS.

One of the regular mailing trade firms last year offered this bulb as a novelty. But as nothing was said as to its position in the plant world, or the proper method of growing it, the novice planter was pretty nearly as sure to fail as to succeed with it. It is a bulbous plant, allied to the *Amaryllis*, having yellow, fragrant flowers, which are quite showy, blooming in clusters. It comes from Buenos Ayres in South America, the latitude being about that of our Southern States. J. L. Childs' monograph on lilies and allied bulbs states that this *Chlidanthus* (which is the only one of the genus) can be grown in the open border, and that the treatment should be at all times the same as that of the *Gladolus*. Should this bulb bear out all that is said of it, it will prove itself an acquisition, indeed. Our own trial of it last season was without satisfaction, because of the poor quality of the bulbs received.

MYRA V. NORRIS.

### A COMPETITION.

A first prize of \$500 and a number of smaller prizes have been offered by The Century Co., publishers of *The Century Dictionary* and *Cyclopedia*, for the best answers to a hundred and fifty questions covering a broad range of information. An additional prize of \$500 is offered to any one who can answer 90 per cent. of the questions from any ten published works of reference other than *The Century Dictionary* and *Cyclopedia*.

If you want to see a real useful, helpful farm and garden and fruit paper, send your name and address—no money—to *The Rural New Yorker*, New York. We can send it and AMERICAN GARDENING both one year for \$1.80 and your money back for *The Rural* in three months if you want it.

## WHOLESALE MARKET REPORT

## New York.

Speaking generally, the cut flower market for the week preceding Lent has been a failure. Usually it is the one week in the year that prices are stiffer and the market gets cleaned out closer than at any other time of the year. But it has failed the grower in both directions this season, the average on prices being to him very low. Roses and carnations have shortened up in supply. Violets are exceedingly plentiful, more so than ever before, and prices are below the half of former years at this date.

The fruit and vegetable market has improved considerably in tone, and on fair grade stock is cleaning out well. But buyers are shy at any advance in figures, and are quick to turn down any attempt.

Cucumbers are moving freely at \$2.00@2.25 per dozen for No. 1, with No. 2 at \$1.00@1.25.

Mushrooms are doing better than in several months. Good stock is realizing 40¢@50¢ per lb. Stock a little off, 30¢@35¢ per lb.

Hothouse tomatoes, if of good color, sell readily at 30¢ per lb.; but considerable of this stock is sadly deficient in color and hardly comes up to the standard of that from the South.

Hothouse lettuce is also meeting with better trade. A limited quantity of very fancy makes 75¢ per doz.; general figures rule from 25¢ to 60¢ per doz.

New potatoes (Bermuda Early Rose and Garnet) sell at \$6 to \$7 per barrel for No. 1. Havana stock \$5.

Some very handsome celery is on the market (Florida grown). This is shipped in the soil and trimmed upon arrival, making as high as \$1.25 per dozen stalks. Other stocks of prime celery move well at good prices.

Rhubarb sells at \$3 to \$4 per 100 bunches. Radishes, \$2.50@3.00 per 100 bunches.

Fancy hot-house strawberries maintain their price well.

English grapes are meeting with no competition, and, though falling off in quality, sell at \$1.25 to \$1.50 per lb.

Apples are weakening, and will hardly bear out quoted prices.

## Philadelphia.

Business in this market has been very quiet the past week. There has been a falling off in receipts of stock, yet prices have not become any firmer. Very little stock has been received from the South, and most of what has arrived is of poor quality.

Hothouse lettuce is now being sent in and has been selling at 50¢ to 65¢ per dozen, but does very slowly at these figures.

Mushrooms continue to move fairly well, selling at 35¢ to 40¢ per pound.

Hothouse cucumbers are held at \$3.00 per dozen. These also do not sell very well.

The apple market has been very brisk all the past week, a large quantity of stock being disposed of. There has been very little change in prices, but, if anything, they are a trifle firmer now.

## PRIVATE GARDENERS.

### Appointment.

G. J. Brown has succeeded A. McKenzie as gardener to W. S. Gurnee, Blauvelt, N. Y.

### Spring Auction Sales.

The first sale of the season was held on Tuesday, March 2, by William Elliott & Son, Dey street. Roses, nursery stock and bulbs were offered. Sales will be held regularly after this date every Tuesday and Friday.

J. P. Cleary arrived from an extended European trip on the steamship Mohawk from London, Friday. The Cleary Company has opened its new auction rooms at No. 60 Vesey street, New York. Regular sales are expected to begin next week.

R. M. Gardner will open the season at No. 119 Fulton street, New York, about March 12.

### Mount Kisco, N. Y.

On Friday, Feb. 26, a very successful meeting of the Westchester County Horticultural Society was held here. Mr. John Hunter, of Hempstead, L. I., read a paper on "Small Fruits."

### New York.

The meeting and grand exhibition of carnations, standard varieties, and novelties of this season, to be held at the rooms of the American Institute, 111 W. 38th st., on Tuesday, will present an excellent opportunity for gardeners to make comparisons; also for anyone having seedlings of merit to exhibit. Of new frame Violets, a fine selection from various growers will also be on exhibition.

### Orange, N. J.

The New Jersey Floricultural Society met on Monday last. Thos. Willey, East Orange, and J. Keenan, Orange, were elected to active membership. The Exhibition Committee reported adversely, having failed to negotiate with the memorial hospital regarding a fall exhibition. Considerable discussion followed upon the subject, and eventually the matter was left in the hands of Dr. Kitchen to enter into arrangements, if possible, with the ladies of the Orange Improvement Society, or any other organization. William Fitzwilliam read a short, practical paper on "Landscape Gardening," which was well received.

### Boston, Mass.

Though not a prize day, a good display of flowers was made at Horticultural Hall on Saturday, Feb. 20. Oakes Ames (Carl Blomberg, gardener) sent six Cypridipediums; Calypso Oakwoodemal of clear color with good form. C. Lathamianum superbum; C. Leeanum, var. a very fine variety which seems to be a hybrid of C. Leeanum with C. Spiceranum; C. longifolium; C. Lemoinei Calurne X porphyreum, and C. Sedenii candidulum longifolium X Schlimii albidiflorum. Also fine specimens of Odontoglossum Roezili album, five varieties of Cattleya Trianae, one of which had five flowers on one spike. Asclepias Curassavica, a native of Florida; Cyperus alternifolius; Rosa sinica, the beautiful Cherokee Rose. Camellia japonica rubra, and C. jap. alba; several Begonia Roses and the old-fashioned Rubus rosaefolius coronarius. James Comley brought some forty vases of Camellias, Azaleas, Begonia and a vase of Cypridipedium villosum, several vases of Coelogyne cristata, Cytisus albus, a fine broom from Japan, with white flowers which will probably prove hardy; Senecarpus sinuatus, with curious reddish flowers and large glossy, oak-like leaves; a very good seedling carnation of a greenish-white color, and the old-fashioned Isabel Sprunt rose. Mrs. E. M. Gill exhibited a collection of flowers, including Swainsona, Nasturtiums, Daffodils, Clivia miniata, Antirrhinums, Genista and Bougainvillea glabra Sanderiana.

Jacob W. Manning brought a new Hemerocallis from Japan. H. aurantiaca major with large orange-yellow flowers; it was awarded first-class certificate of merit.

George D. Morse exhibited radishes and Warren Heustis & Sons dandelions. Mrs. E. M. Gill brought a dish of mushrooms.

### The Professional Gardener's Mission.

The admirable paper read by Mr. P. O'Mara before the Lenox Horticultural Society is a valuable contribution to the literature of gardening. It is full of wise saws and many illustrations which if read and noted by all interested in horticulture would prove of general benefit. There are many suggestions, tending to the advancement of the craft, that every gardener should carefully consider; they should not be cast aside after the first reading, but the many practical topics presented should be reperused and acted upon individually. I wish the lecture were published in pamphlet form and freely distributed, that it may kindle a greater enthusiasm in horticultural interests, with an awakening of appreciation of the work of those faithful gardeners who have done so much to improve our flowers and vegetables in the past, and also to act as an encouragement to those dormant talents which may produce improvements that will still more interest us and please our tastes.

PORTIA.

It gave me great pleasure to read the very exhaustive paper on the above subject, read by Mr. O'Mara before the Lenox Horticultural Society. Truly the "Gardener" does a great deal toward the advancement of horticulture by the establishing of flower shows; giving practical lessons in gardening to cottagers in this vicinity; distributing spare plants, cuttings, seedling ferns, etc.

His mission is a grand one, but where is the missionary who is to look after him and his family when on account of the place where he is employed being sold, or closed for an indefinite period, he is compelled to turn out and look for another place—and that place is not forthcoming?

First of all he must find a home for his little family and get in the necessities; his hand is continually in his very light pocket-book, and being a gardener, he hates to think of doing anything other than some branch of gardening. He starts on the rounds of the seed stores, wanting to know if there is "anything going," failing in this he gets the daily paper, where under the head of "Men Wanted" he finds an inquiry for a qualified gardener. He brushes up a bit, takes his papers along, presents himself in the front hall to be informed that they want a man without any children.

The poor fellow returns to his wife and tells the whole story, and in reply she says: "Well, I hope something will come soon, or I do not know how we are to live. I had to break our last fifty-dollar-bill this morning to pay the coal man." This is no imaginary tale, but it is what I have witnessed time and time again. Can there be no workable scheme to assist those men when they are out of situations, and until they procure one? Are there no nurseries where they could be employed profitably to the employers at a low pay, where those requiring the services of a gardener could come when they wanted one, and get a duly and well qualified man without having to resort to advertisements in daily papers?

I am under the impression that horticultural societies throughout the country have been very well nursed these last few years and have been appreciated, and are doing good, and those that are carried on without red tape are bound to succeed. Now, why not turn round and take the professional gardener into consideration.

TIMBER TOPPER.

Alfred Dimmock, representing F. Sander & Co., St. Albans, England, arrived on steamship Lucania, Sunday last; Mr. Dimmock says that this makes his thirty-third trip on the water, and that it was the worst he has yet experienced, the sea being like a boiling cauldron all the journey.

**Burn Orchard Trimmings.**—Fruit growers are not as careful as they should be in the disposition of their orchard trimmings. It would be well to burn them as soon as possible. This will prevent the further spread of any insects that may be harbored in such trimmings.—Horticultural Commissioner A. D. Pyral, California.

## "Boy Wanted"

### when planting with the "Improved-Robbins Potato Planter."

Results: 100% of the seed planted correctly. No buried seed, no packed soil, no misses, no doubles. Recommended by leading Potato growers and guaranteed to give satisfaction. Send for catalogue describing 50 different implements.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\*We cannot undertake to reply by mail.

### HONEYSUCKLES.

(What is the botanical name and synonyms, if any, of the upright or Tartarian Honey-suckle? What are the most useful Loniceras?—C. W. HAMILTON.)

—The Tartarian pink honeysuckle is *Lonicera tartarica* (no synonyms) introduced from Tartary in 1752. *Ailbiflora* came from the Pyrenees in 1739. *Rubrifolia* also came from Russia in 1752. In this section there are also *latifolia* and *lutea*. These are all obtainable now, or rather improved garden forms under the title var. *grandiflora* white or pink, all bush forms and deciduous. Among the trailing kinds perhaps the very best for covering low walls in exposed positions is *L. Halleana*. It flowers from July till late fall and holds its leaves right into midwinter; in fact it is almost evergreen. The flowers are white and are produced in great abundance; brachy-poda and var. *aurea reticulata* are also excellent kinds. Then to these may be added *L. Belgica*. A monthly flowering kind blooms all the summer. Flowers red and yellow, very fragrant. *L. Periclymenum*, the common woodbine, is not to be despised. Among new kinds, but of this kind we have no experience, nevertheless it is well spoken of is *L. fuchsoides* (scarlet).

### SHAPING HEMLOCK HEDGES.

(When is the proper time to shear a hemlock arch or hedge? Before or after spring growth or both? I have reference to making a nice, neat appearance and also maintaining the health and vigor of the trees.—Thomas T. Newby.)

—If so much time can be spared, and it is worth while doing so, prune the arch into shape with a knife, and do not torture the plant by stubbing with a shears. The plants can be made very shapely by cutting out branches and twigs. Do this first about two weeks before spring growth begins; then during the season of growth continue the practice, removing any branches or twigs that may appear out of position.

### TREATMENT OF FRUIT TREES.

(To C. F. Mulford, O.): It depends a great deal on the size, kind and variety. Little definite advice can be given when a question does not even say whether the tree be apple, cherry, peach or quince. More attention to details when asking questions would be helpful for all concerned. Other points raised by C. F. M. are answered in the "Fruit Garden," this issue.

### TRANSPLANTING QUINCES.

(Are three-year quince bushes too old for transplanting? Would you advise against purchasing them?—A. E. HOWARD.)

—We see no objection whatever. Three-year-old plants are often sold.

### PIPE FOR HEATING.

(How much 1½-inch pipe as a coil will be required to heat 200 feet of 3-inch pipe? How much 2-inch pipe to heat house 45x25 feet, three-quarter span; front wall 4 feet high; back wall 9 feet high; exposed to east winds only? Thermometer goes to 10 to 15 degrees below zero, and I want 70 degrees in day and 60 at night time fully.—W. F., Oshana, Ont.)

—About 60 linear feet of 1½-inch pipe will be required in a coil heater for 200 linear feet of 3-inch black pipe. For a house as above described it will require about 500 linear feet of 3-inch black pipe, and would for this size of pipe have not to exceed two returns for each flow. We would prefer to use about 1,000 linear feet of 1½-inch pipe, or 225 linear feet of 2-inch pipe, arranged as five flows and 720 linear feet of 1½-inch pipe arranged as sixteen returns. For houses not over 100 feet long, would use two returns for each flow when the pipes are of the same size, but if the flows are larger than the returns, a corresponding increase in the number of the returns can be made.—L. R. TAFT.

### ONIONS FOR MARKET.

(To J. R. J., Ont.): The selection of onion sets depends entirely upon your market and what color it demands. Some want red, others white or yellow. If not already done, you should find out which is required. Then possibly the three best to select from would be White Globe, Red Globe and Yellow Globe Danvers. These are all of a size and come in by the same date.

† Danger in Bananas.—A fruit dealer of Pittsburgh lately had a bad experience with a tarantula which was hidden among some bananas which he was handling. The creature severely bit the man's hand.

# PREMIUM OFFERS

....OF....

**Plants, Seeds, etc., in our issue of February 6th.**

Our premiums are offered with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will), he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

In our issue of February 6 we published Premium Offers, embracing a vast assortment of Standard, Fancy and Novelty Collections in Seeds, Fruits, Flowers and Vegetables, to which we invite the careful attention of every one of our readers, in the hope that, becoming interested, they will seek to earn these premiums and so increase our subscription list.

The Premiums offered are all of exceptional value; there is nothing bordering on the sensational in the various announcements, and great pains have been taken to secure offers from reliable growers and specialists. As we have previously stated, the publishers of AMERICAN GARDENING neither buy, sell, nor in any way do they trade in the stocks offered, except to mail the orders as received to the growers or dealers making the offers. This arrangement makes it satisfactory to our advertisers, who, in turn, being thus afforded an opportunity to introduce their specialties to likely new customers, at practically no cost for advertising in any of its ramifications, are thus enabled to give values which are unprecedented in the annals of Premium Offers.

**If you want a copy of our Premium List let us hear from you and we will mail you one.**

## CAMPBELL'S EARLY Our Marvelous New GRAPE

Best and most valuable. Highest commendation from highest authorities. Hardy, healthy, vigorous, very productive. Early or late. Largest clusters, finest quality, not foxy. Seeds need not be swallowed. None genuine without our seals. We guarantee safe arrival by mail. Largest stock of Grape Vines in the World. Small Fruits. ### Cordon Pear Trees.

In order to establish cordon trees, such as are shewn in the accompanying illustration (fig. 58), make a bed as necessary of good soil, 3 feet wide and 2 to 2½ feet in depth. Insert main posts at intervals of 6 feet, and so as to be about 7 feet out of the ground, then stretch six lines of galvanized iron wire No. 14, and draw them very tight. Take wooden slats

Bartlett, Duchesse, Louise Bonne, Beurré Diel, Clapp's Favorite, Beurré Hardy, Beurré Giffard, Andre des Portesses, etc.

After planting, attention must be paid to shortening back the main growth of the tree in order to throw vigor into the lower portion. Cut back to one-third of its length, and during the summer pinch out all shoots which throw to the front or back of the row, leaving only the laterals; and even these,

FIG. 58.—MAKING THE MOST OF THE SPACE.

one-inch wide and one-eighth inch thick, adjusting them on the wires so as to make an angle of 45°, using thin galvanized wire to secure them in place. These slats should be at a distance of 18 inches apart.

As to the trees to be used: select those one year grafted, and by preference have them on the quince stock, which has a dwarfing tendency, and it will also be well to plant only those varieties which come into bearing early, such as

if they grow too vigorously, are to be pinched back to leave three or four leaves, and tie up the leader which is to form the main body of the tree.

In the second year allow the main shoot to lengthen 6 to 10 inches, and so on each year, thus throwing strength into fruit spurs. It is well to thin out the crop, allowing the tree to carry a few very fine fruits rather than overtax its bearing capabilities.

## Great Crops of Blackberries, and How to Grow Them.

R. M. KELLOGG, Ionia, Mich.

For commercial work, there is a wide opening in blackberry culture. There is scarcely a community even partially supplied, and as generally grown the quality is so low that the consumption is the merest fraction of what it would be if such methods were adopted as would secure the highest development in flavor, size and productiveness. When grown, as I shall hereafter point out (under reasonably favorable location, soil and climatic conditions), the crop should exceed three hundred bushels per acre, of a grade that would rank with the luscious strawberry, and even outdo that king of the small fruits as a money maker. The berries come at a season when there is no other berry in the market, and make the connecting link between raspberries and grapes, so as to enable the small fruit grower to appear on the market every day throughout the season.

### Causes of Failures.

Let us consider for a moment some of the causes that have led to the quite general failures in attempts at blackberry growing, either for market or for home use. I do not care whether it be plants or animals, the continuous breeding or propagation from scrubs will soon cause them to part with every good quality they possess; on the contrary, the only way to improve and accumulate good qualities in any variety is to discard everything which does not approach perfection, and select ideal specimens, keeping them so restricted that the powers of reproduction (fruiting) shall constantly be increasing. From time immemorial it has been a custom of nurserymen to take an old patch and plow it in the fall, cutting the roots up as much as possible, so that each year suckers would come up in the greatest profusion, and then the more plants that were dug the more came up, until the whole became a tangled mass. They were rarely or never pruned, and allowed to stand without tillage to support them during the drought, so that the strain of maturing even a small quantity of berries was beyond their ability, and consequently exhaustion followed.

Growers took these plants and fruited them eight to ten years, until run out, and then dug suckers from them, and set a new patch, and so on, successively, until, getting only seedy buttony fruit, they threw up the business in disgust. When a blackberry cane becomes weakened from any cause, it will throw up suckers until they become an intolerable nuisance, and we must never forget that in cutting either tops or roots of a plant we are only dividing the individual, and carrying into the new plantation whatever weakness it possesses.

When we dig a sucker plant we generally get only a few roots with it. The foliage absorbs the strength of what rootage there is, and, there being no calluses formed, few new roots start. Those already established grow only from the end, and in this way will often go out forty or fifty feet from the bush, while near the plant will be found very few roots. The sap, having to pass through these long roots before it can reach the foliage for assimilation, greatly aggravates the sucker nuisance, and the few ber-

ries secured are generally dry, seedy and flavorless.

### The Ideal Blackberry.

Now let me describe my ideal of what a blackberry should be, and see if I can formulate a method of producing it and preserving the highest fruiting vigor, and put on the market a grade of berries so delicious that the demand shall always be in excess of the supply.

There should be no weak or puny bushes, but all uniformly large, and enriched with full blood and the strongest reproductive powers or fruiting vigor. Now, we cannot do this by propagating from anything less than perfection itself, and so we must go to the fruiting field early in the season to search for this ideal. Find the cane that is thickly studded with large, well developed buds, and examine the tips to see that it has stood the winter blast without the slightest weakening, and stake it, taking care to so prune it that its fruit shall be no more than it can bring to perfection. Carefully examine the stamens when blossoms first open, and note their size and general condition. Where stamens are plenty and well charged with the vital dust (pollen) score high, and give that plant bearing them the preference. I hold it of the utmost importance, and believe I have proven by actual test, that maximum crops of berries or any other kind of small fruits cannot be secured where plants, trees or bushes are allowed to shed their pollen year after year without restriction until the potency of the pollen has been destroyed; that restriction, selection and high feeding are as essential to building up good qualities in plants as they are in animals, and I believe the lack of attention to these essentials is the greatest cause of failure in fruit growing. A plant over three years old should never be chosen for propagation.

Find as many bushes as possible, give them high culture, so as to secure highest development. At harvest time, count and measure berries accurately, and determine which possess the most points of excellence. Now, early in the fall, or as soon as leaves are fallen and the plant is entirely dormant, dig up every root, select those about the size of a common lead pencil, cut into pieces three inches long, and bury them in clean, sharp, fine sand, placing the boxes in a cold cellar, kept just above the freezing point, so they will callus and form wood buds. If the cuttings be kept too warm they will start and grow; if too cold, the callus will not form.

### Spring Treatment.

The following spring prepare a piece of rich sand loam, with plenty of moisture, on a south incline, and plant the cuttings in nursery rows, about two or three inches apart and not over two inches deep. If planted too deeply the shoots will damp off; and if too shallow, they will dry out. Some system of irrigation, in case of drought, should be provided. In the fall the plants should be taken up and roots cut back to about eight inches, and again packed in fine sand, keeping them as before until spring, when they will be thoroughly callused, and, when planted out in well prepared soil, will fill the ground with a mass of feeding roots all near the plant, thus bringing the "food gatherers" near the organs of assimilation. Under these conditions each plant occupies its own feeding ground without trespassing on the others, so we know where to apply

fertilizers and do the cultivating. As already stated, every cutting possessing any weakness has failed to grow, and we cannot now have anything but the strongest and most healthy plants.

### Situations for Blackberries.

Blackberries will generally do well on low land, if winter protection is given; but if the hardy varieties are used without protection, high land should be chosen. The soil should be neither the light sand nor heaviest clay. In fertilizing, bear in mind that ground rich in potash and phosphoric acid makes strong, firm wood, and greatly aids seed formation, while that excessively rich in nitrogen makes the wood soft and succulent and easily winter-killed; hence, all the wood ashes should be saved for the blackberry patch.

Having our ground deeply worked and subsoiled, we plow furrows about eight feet apart and six inches deep, set plants about three feet apart, taking care not to expose the roots, loaded, as they are, with the calluses, but cover them at once and firm the soil, and cultivate shallow the same day of setting, so the water may draw up around the plant and nourish it at this critical period.

### Hints on Cultivation.

The two chief difficulties in blackberry culture are the drought and winter-killing. These may be reduced to one difficulty, because the management during the summer is often the chief cause of winter-killing. Every possible effort should be made to force a vigorous growth early in the spring, and this should proceed regularly until fall rains come, when the autumn months should be used to mature the wood. The cultivator should be kept going as soon as dry enough in the spring, and the priceless water should not be allowed to get away. The whole surface should be covered with a fine loose earth all the time, and a crust should not be allowed to remain a moment longer than necessary. Cultivate every week and after every rain.

It is the greatest blunder to stop the cultivator when picking begins, just at the time when the bushes need moisture so much to fill their great loads of berries with their rich juices; the feet of the pickers tramp the ground down hard, and capillarity is perfect to the surface, and water passes off with the greatest freedom; the berries soon dry up, and the vitality of the bush is sapped by having its functions suspended in hot weather. The plant goes through the same process as if preparing for winter, buds form and foliage ripens. Later, the fall rains come, a new growth starts, and the early frosts destroy the leaves, rendering the proper ripening of the wood an impossibility, and winter-killing is sure to follow.

### As to Pinching and Pruning.

It has been almost the universal practice to pinch new canes when about eighteen inches high, so as to make them throw out laterals and become stocky and self-supporting. If the ground be rich, so that a vigorous growth is made and no trellis used, the canes would sprawl around on the ground, so as to interfere with cultivating and picking, and thus pinching in may become a necessity; but I confess I have come to entertain the gravest doubts about the advantage of suddenly stopping growth by removing terminal buds when in full tide of growth. I am satisfied it brings on a congested condition, that seriously in-

terferes with the hardiness and the vigor of the canes. The better way is to set stakes about every thirty or forty feet, string a No. 9 wire about four feet high; then with well-gloved hands and a bundle of short willow pass along rapidly and tie each cane, spreading them out fan-shape, so they will have plenty of air and light, all out of the way of the cultivator, and so that pickers can get to the fruit with the greatest ease. No dirty berries, none threshed off by the wind, no broken canes, but pruning and all work done with an ease that much more than compensates for the cost of wire and tying the canes to it. Different varieties require different pruning, and on some soils the canes can be left longer than on others, but in any case it should be so close that there will not be any overbearing and consequent exhaustion of the plant.

#### Gathering.

A green blackberry is not the sweetest thing on earth; the fruit should be black at least three days before picking. Twice per week is plenty often enough to go over the bushes to gather from them. Exercise the greatest care that the berries do not stand in bright sun after they are in the boxes; they

### Successful Celery Storing.

After testing the various methods of storing celery for winter use, I am convinced that, for my own purpose, at least, the one I herewith describe is best. I use Giant Pascal and New Rose for winter, and plant three rows close together (six or seven inches apart), and the plants about the same distance apart in the rows. The ground is heavily manured before planting and the plants are kept well watered and cultivated. They are given but one slight earthing up until slight frosts set in. Stakes are then driven in along the two outside rows, giving the tops a slight inclination toward the central row, and having the tops of the stakes about level with the tops of the celery. Earth is then banked up about two-thirds of the height of the plants and made firm. A ten-inch board is then set against the stakes on each side and the earth is banked to a level with the top of the boards. Two more boards are nailed together at right angles to one another and these are placed over the top.

Some straw is placed alongside of the rows and is put over the boards during a sharp freeze. In mild weather both straw and boards are removed

FIG. 59.—SUCCESSFUL STORING OF CELERY.

then quickly sour and turn red. Keep them in a cool, dark place.

#### Varieties.

The list of desirable varieties is not long. Of the extreme hardy sorts, Western Triumph and Snyder still head the list, Taylor's Prolific being the best late variety and of highest quality. Ancient Briton is a grand berry, and a leader in many localities. It is classed as hardy, but should be given winter protection in the North. The Erie has gained many warm admirers, and will remain with us until we find our ideal berry. It has many of the desirable qualities. Wauchusett's Thornless, Early Cluster, Lawton, Kittatinny and a few other sorts have nearly gone out of use in this section.

Of the new varieties, Eldorado is the most promising. I could not find a cane showing the slightest injury from cold the past winter, and its fruit is very fine. Wilson Jr. and Early Harvest rank high, but must have winter protection in all cases where fruit is expected. With improved methods of culture and a better knowledge of the requirements of the blackberry, we shall, in the no distant future, see it a leader in the berry market.

entirely. This is all the protection that will be needed until severe winter weather sets in, when the whole bank may be covered with leaves, straw and litter of any kind. The accompanying sketch may present a clearer idea of this method.

The point that appeals most strongly to my fancy is the fact that the plants are stored just as they grew and that they are able to continue growing, not having been disturbed at the roots, thus giving them the opportunity of making what is essential to late-keeping celery, viz., a late growth.

Millbrook, N. Y. I. L. POWELL.

[We are able to vouch for the excellent quality of the celery thus stored. Never have we enjoyed a sweeter or crisper sample than that sent in by Mr. Powell with the foregoing communication.—Ed.]

#### American Apples in Germany.

According to the Consular reports there has been a boom in American apples on the German markets, and during last year the Germans imported over twenty times as many as had been the case in any previous year. Consul at Frankfort thinks that this market can be made permanent if growers and shippers take proper care in sending only the best. The Victory is one of quality, not price.

### The Gooseberry.

From Paper by Professor W. M. Munson Before the Maine Pomological Society.

Under good culture gooseberries will succeed well on a variety of soils, but as with the currant, the best results are obtained on a strong, rather moist, well-drained, clay loam. Thorough but shallow cultivation should be given.

As a commercial crop gooseberries are often grown between the trees in young orchards, as they do fairly well in partial shade. In ordinary field culture the plants should be set five feet apart each way, or in rows six feet apart and four or five feet distant in the row. Gooseberries are trained both in the tree form and in the bush form. Ordinarily the latter is preferable.

#### Pruning.

As a rule little pruning is required during the first three or four years, except to head back the strong new shoots and remove a few of the less vigorous ones for the purpose of developing fruit spurs all along the canes. The latter treatment consists in annually removing superfluous branches and checking growth sufficient to keep the bushes within bounds.

#### Propagation.

The gooseberry may be grown from cuttings as is the currant, or by mound layering. By this method the old plants are headed back to induce the formation of strong new shoots near the surface of the ground. Late in June or in July when the new wood has become somewhat hardened a mound of earth is made about the "stool," the earth being about four or five inches deep above the bases of the shoots. In the fall the earth is removed and the rooted shoots are cut off and planted at once in well prepared soil, or they may be tied in bundles and treated as cuttings until the following spring. If care is used in removing shoots during the winter, propagation from the same plants may proceed indefinitely from year to year.

#### Varieties.

The American varieties are those which have been developed from our native species and are of comparatively recent origin, for it is but few years since gooseberry growing came to be a profitable industry in this country. The European varieties are very large and have the advantage of a great variety of coloring. They are, however, susceptible to mildew.

Downing, Smith's Improved and Pale Red are the most valuable of the native varieties. Downing is much superior to the other in size and quality. It is not quite as prolific as Houghton, but the fruit is much more attractive and therefore it is the variety most popular in the market. Of the European sorts, Industry and Whitesmith lead.

#### Yield.

The yield of gooseberries as reported by different growers varies greatly, but about 100 bushels per acre is considered a fair average by many. From some of the bushes set in our own plantation in 1891 we harvested 12 quarts the past season. Even with an average of two quarts per bushel, however, the crop is a profitable one to grow.

**The South.**—We are in receipt of a brochure put out by the Ocean Steamship Company of Savannah in which is much information for the benefit of those who desire to go "down South." The book comprises 32 pages and has a profusion of halftone illustrations, which afford the reader a vivid idea of the luxuriance of navigation about Savannah; the views of the various parks are also interesting.

## Combine Against Insects, Etc.

At a meeting of the Ohio State Horticultural Society in February, 1896, a resolution was passed requesting all State horticultural societies to send delegates to a national convention to be held at Washington, D. C., on the 5th of March, 1897, to consider and recommend the most appropriate Federal and State legislation for preventing the introduction or diffusion of noxious insects and fungi in the United States.

The convention assembled at the Ebbitt House on the date arranged, the sessions lasting all that day and the greater part of the next. E. H. Cushman of Ohio was elected president, J. H. Hale of Connecticut vice-president, Wesley Webb of Delaware secretary, and M. J. Daniels of California assistant secretary. Among those present as delegates were the following: William R. Sessions, Boston, Mass.; D. D. Denise, New Jersey; B. T. Galloway of the Agricultural Department, M. B. Waite, also of the Department of Agriculture; W. H. Farnsworth of Waterville, O.; S. A. Beach of New York, H. E. Van Deman of Parkersburg, Va.; W. B. Alwood, Blacksburg, Va.; H. Gorman, Lexington, Ky.; L. O. Howard of the Agricultural Department, M. V. Slingerland of Ithaca, N. Y.; Wesley Webb, Dover, Del.; Otto Luger, St. Anthony Park, Minn.; J. Van Lindley of Pomona, N. C.; Gerald McCarthy, Raleigh, N. C.; M. J. Daniels, Riverside, Cal.; S. B. Heiges of Washington, president of the Pennsylvania Horticultural Society; W. W. Miller, Columbus, O.; N. H. Lowe, Geneva, N. Y.; C. M. Hooker, Rochester, N. Y.; H. K. Snow, Tustin, Cal.; E. S. Henry, M. C. of Connecticut; H. J. Wibber of the Department of Agriculture, S. H. Derby, Woodside, Del.; C. M. Hobbs, Bridgeport, Ind.; Robert Gulick, Linkwood, Md.; E. S. Goff, Madison, Wis.; W. G. Johnson, College Park, Md.; J. W. Baker, Nashville, Tenn.; Walter H. Evans of the experiment station, Washington; E. H. Bissell, Richmond, Va.; E. M. Wardell, Los Angeles, Cal.; F. M. Webster, Wooster, O.; N. J. Bachelder, Concord, N. H.; Colonel E. S. Chamberlin, London, Va.; E. H. Cushman, Euclid, O.; Captain R. S. Emery, Chestertown, Md.; Colonel J. H. Brigham, Delta, O.; W. C. Barry, Rochester, N. Y.

Professor L. O. Howard, entomologist of the Department of Agriculture, read a paper on the introduction of foreign insect pests and methods of prevention to be taken. He said that in a collection of 600 species of noxious insects exhibited at the World's Fair, 111 species were introduced from other countries. Among scale insects alone 23 species were of foreign origin. The noxious insects from countries having climates similar to our own, such as Europe, China, Japan and Australia, are most to be feared. Those from tropical and sub-tropical countries are not so dangerous except in the extreme South. He showed that even with rigid inspection at the ports of entry, how difficult it is to guard against importation by giving the history of the Gypsy Moth, the Hessian fly, and the common cabbage butterfly. Judicious inspection might have kept out several pests in the past. He thought the establishment of adequate inspection at the ports of entry need not be expensive to the general government.

Professor B. T. Galloway read a paper entitled "Plant diseases and the possibilities of decrease by legislation." Plant diseases he divided into two groups (a) those caused by insects and fungi and (b) those which originated through unfavorable surroundings. He showed how difficult it is to expect aid from legislation owing to the difficulty of detecting diseases in their incipient stages, again one state might make good laws while bordering States might take no action, thus rendering the work done of less importance than if all passed similar remedial measures.

A paper from B. M. Lelong, California, on the inspection of trees, fruits and plants in that State, was read by the secretary. After a recital of the various Legislative acts passed by the State showing that very satisfactory work had been accomplished, he cited several cases where large importations of badly infested trees had been

destroyed, among them a lot of 325,000 citrus trees, comprising one shipment which had been condemned and destroyed at San Francisco after fumigation had been found to be ineffective. He stated that California was no longer the dumping ground for pest ridden trees, and as all the States had been benefited by the legislation of California, other States ought to adopt similar legislation.

Mr. Gerald McCarthy of North Carolina read a paper on insect foes, their prevention and eradication.

Mr. McLaughlin, member of Congress from California spoke on the quarantine of trees at Los Angeles, and showed how the whole country had been benefited by the State laws prohibiting the introduction of pests. He thought that should a bill be drawn up governing the inspection of importations that Congress would be found in the humor to give the subject its earnest consideration.

At this point Mr. Wilson, the new Secretary of Agriculture, addressed the convention, and in the course of his remarks stated that he was in sympathy with and expressed his willingness to do all in his power to further the objects the convention had in view.

A committee on legislation was formed, consisting of ten members, with W. B. Alwood, Blacksburg, Va., as chairman. Several resolutions were reported by the committee to the convention for its consideration previous to drawing up a bill to be presented to Congress. These resolutions, which were adopted by the convention, recommended State legislation against the introduction of dangerous insects or plant diseases, and that each State provide inspectors of nurseries and premises for the detection of insects, and these inspectors be given power to order remedial measures when such be found necessary, and that each State provide the most approved remedial measures.

The bill subsequently reported by the committee is entitled "An act to provide for the inspection of trees, plants, shrubs, roots, buds, pips, scions, grafts or nursery stock imported into the United States, and for the inspection of plants grown in the United States which become the subjects of interstate commerce." It empowers the Secretary of Agriculture, at the expense of the owner, to place in quarantine all articles imported which are described as above, and to have them inspected for the purpose of ascertaining the presence of insect or fungoid diseases. When such trees, etc., are found to be infested with disease or insect pests, they are to be treated at the expense of the owner or destroyed if their condition warrant it. Appeals may be taken from the decisions of the inspectors to the Secretary of Agriculture within three days, the decision of the Secretary to be final. When the inspection shows the goods to be apparently free from disease a certificate is to be issued to the owner by the inspector, which precludes further inspection within the States. If found to have been treated abroad, and accompanied with a satisfactory guarantee, this will be accepted in lieu of inspection at the port of entry. The bill makes it unlawful to transport from one State to another all trees, etc., which have not been examined by inspectors and certified to be free from fungoid or insect diseases.

The committee on legislation was made a permanent one, with the power to appoint an executive committee to take charge of legislation. The convention adjourned sine die, subject to the call of the president and secretary.

**June Beetle.**—To prevent the laying of the eggs of the June beetle in the corn field in May or June, it is desirable that the ground should be kept practically free from weeds at that time, as it is well known that a surface growth of vegetation is a strong attraction to these insects searching for places suitable for the support of the young. Some of our more recent observations show that the beetles are likely to deposit their eggs in the field from which they themselves have emerged.

**Cannas** should now be divided up to increase stock.

## The Vegetable Garden.

**Cabbage.**—It is now time to make another sowing of early and intermediate cabbage for succession. There are none better for this purpose than the Early Jersey Wakefield, with Henderson's Early Summer to follow. All seedlings as soon as they can be handled should be transplanted two to three inches apart.

**Cauliflower.**—The early Snowball is the most satisfactory all round cauliflower for general use. A sowing of this should be made at once to insure well established plants to set out as soon as the weather is favorable, so as to succeed in growing good heads before the hot weather sets in, for then it is difficult to grow the crop satisfactorily, other than in exceptionally suitable locations. Prick out the seedlings into other flats as soon as a pair of true leaves is formed, otherwise they are liable to damp off at the stem.

**Celery.**—Those requiring early celery and who have not yet made a start should lose, no time or it will be very late in the season before any can be had fit for use. By soaking the desired quantity of seeds in water for twenty-four hours, and mixing with dry dust or sand, for convenience in sowing, germination will be accelerated. For early use there is none equal to the White Plume variety, but for private use it is a good plan to grow some of the new Pink Plume with it, which two make a pleasing contrast upon the table. Seeds should be covered lightly, kept moist, neither too wet nor dry.

**Egg Plants and Peppers.**—If not already done sow at once, then keep in a steady, brisk heat of 70 degrees to keep them growing without check, as they damp off very easily. Cover the seeds in the flats with sand, and after germination keep as near the glass as possible to prevent spindly growth. When the temperature is rising to about 80 degrees with sun heat, fresh air should gradually be admitted, but the plants must not be chilled by sudden drafts of cold air, especially if they are near the opening ventilator. Seedlings showing a true leaf should be pricked out into other flats or potted in well-drained three-inch pots, using an open, sandy compost, with a small quantity of decomposed cow or sheep manure added. If in pots, they may be plunged in the hot beds, provided the heat therein is not above 85 degrees; thus treated they will not dry up so quickly and extra care in watering is avoided.

W. M. EDWARDS, R. I.

## Freeze Before Forcing.

One of the earliest axioms we learned in early gardening days was that anything to be forced must have a more or less thorough ripening of growth and a period of rest. I have lately had two proofs that such is wisdom.

The earliest batch of rhubarb put in forcing house had only experienced a few slight fall frosts. It never started at all, and has not done so to this day. All successful batches that had a thorough freezing, though treated actually in the same way and placed beside the first, have been all right.

Another case is strawberries. Having more of them than the frames could accommodate, I put the batch I intended to force first in the nectarine house, where scarcely any hard frost reached them. All the rest got hard frozen in frames. Owing to certain circumstances, instead of forcing in successive batches, I put all the lot in at once (our benches in a house 100 feet long), and consequently all were treated alike, and the temperature adapted to the various stages of advancement in growth. As soon as the plants started the difference was apparent, and you could see to a row by the vigorous start of those that had been hard frozen and the weakly uncertain growth of the others what was the matter and where the treatment had been right. The plants are now in flower, but we have thrown out nearly one-half of the batch that came from the nectarine house, the growth was so weak and the weaker flower trusses giving no assurance of a profitable return for labor.

A. HERRINGTON, Madison, N. J.

## New Books for the Vegetable Grower.

Within the past three months no less than five books devoted to the interest of the vegetable grower have appeared. On page 806 in our issue of Dec. 19 last attention of our readers was called to the significant fact that the industry of vegetable forcing was growing by leaps and bounds; that there was an awakened demand for the forced vegetables in Winter, especially outside of the great centers of population, such as the metropolis, Boston, Philadelphia, Chicago, Baltimore and other large distributing centers. These places have, of course, long been great consumers, and may be expected so to continue. What we had reference to is the smaller towns and cities of from eight to twenty thousand inhabitants, and in these the demand has become more apparent.

Within the past two months we have conversed with some large growers, who, taking advantage of this condition, have been enabled to sell all their stock at the home market in their own villages, and by so doing were able to realize better prices than were obtainable in New York, after counting express and commission charges against the latter.

Such circumstances as the foregoing tend to show that the vegetable growing industry is in a healthy condition, and it is in this respect much ahead of its sister enterprise the forcing of flowers; strange to say this is being left far behind in the way of home-written, practical handbooks, and the outlook is that the vegetable grower will very shortly have (if, indeed, works hereafter noted do not supply it) the most complete guide and assistance by way of his library, and this at a very moderate cost. In fact for the expenditure of \$5 or so such a mass of valuable instruction can be obtained that every one may be benefited no matter whether he be a young beginner, an advanced student, or an old hand. In the five books before us there is teaching for all.

Perhaps the most generally valuable book is that of Professor Samuel B. Green of Minnesota; it is a most excellent and eminently practical manual on the growing of vegetables for the home or the market. The author has specially prepared his work that it may be used as a class book for the classes in the agricultural colleges, and is ostensibly written to cover the latitude of St. Paul, Minneapolis and Minnesota. But the work has far more than a local character; it is to a very large degree suited to the grower everywhere in the United States. It is brimful of practical information and is very cleverly and carefully written. The author has solved the difficult problem of imparting exact practical information in plain terms. In chapter III, upon manures, the language is so much to the point and so plain, especially upon the values of the various bodies, that he who runs can read, and learn much. In tabular form are presented first the composition of the vegetable, next the component parts of farm manures, then an analysis of commercial fertilizers, followed by paragraphs upon the making and application of all, wherein are many excellent hints.

We are glad to note the Professor remarks, on page 23, "Commercial fertilizers should never be used until the home sources of manure have been exhausted, and then only to supplement rather than replace farm manures." He qualifies this statement as applying more to Western States, but, we think, there is a growing danger in the Eastern States to run wild on the value of commercial fertilizers, an extravagance that will one day rebound upon the cultivator to such a degree that the land will refuse to yield through sheer exhaustion and absence of humus. With the professor, we believe in the old-fashioned muck properly applied.

Chapter V, devoted to seed-sowing, is full of pointers to the young—aye, and even the old—farmer. Every year do we see enormous waste of labor and seed through injudicious planting, and oftentimes undue

haste. Chapters are devoted to information on cheap forms of glass structures, the hot bed, insect pests and their preventives. Accompanying this last chapter are excellent illustrations of the most injurious insects. At the close of the book are tables of longevity of seed, and showing the amounts of seed per acre required.

The Middle, Eastern and Western States are thus well provided for, and we turn now to the South; this section of the continent finds the outlet of Northern markets for its produce, and taking the necessities of the case from this cue Professor Rolfs<sup>2</sup> has prepared a book of plain, practical talk, providing much valuable information to the Southern grower. The language used is always forcible and clear, and there can be no mistake about the writer's meaning; and when speaking of manure he does not hesitate to call it "muck." He shows a thorough knowledge of his subject, and seeks to give that to his readers in plain, terse language free from all technicalities. We very heartily commend the work to the attention of those for whom it is written, viz.: Market gardeners in the South.

The young market gardener is sometimes in want of a handy guide book, not so strictly cultural, but a guide to the

FIG. 60.—A PLANT BOX.

business in hand, and here Mr. Greiner steps in, taking the beginner by the hand at the very outset and reasoning with him in a plain, practical manner, so leads him through the three parts which he is pleased to facetiously term a "Little pit well built; a little plot well tilled; a little purse well filled." The book should have, as it deserves, a very ready sale among the class for which it is written.

But though the outdoor cultivation of vegetables is thus well provided for, the art of forcing is not without its handbook, which appears as one of Macmillan's Garden Craft Series.<sup>4</sup>

This volume treats almost entirely upon winter work under glass and of the structures themselves. It is very largely made up of extracts from the Cornell Bulletins upon the subject and the columns of American Gardening are also laid under contribution. The entire volume is a collation of facts carefully gathered and served up in such a manner as to be of the greatest advantage to the man who intends to put

money into the business of forcing or who, being already in it, needs help on material points. He has neither time nor money to travel around or to experiment, and this book his wants supplies at an almost infinitesimal cost compared to the sum of information to be gained. No vegetable forcer should be without it in his library. Two subjects exhaustively dealt with are Lettuce and Cucumbers, wherein much practical information, such as our readers are often seeking, is to be found. There has been wanting a handy reference book for the growing of vegetables under glass, and two previously issued have been noticed in these pages, but while they are good, so far as they go, Professor Bailey's contribution will leap into the first place and, we think, will stay.

## A New Plant Box.

The style of box shown herewith I have been using for a number of years and find it is just the thing to transplant tomatoes, peppers or, in fact, any vegetable plant that is desired to put on the market early and get an extra price for. I use the boxes principally for early tomatoes, transplanting into them about ten days before I wish to market the plants. Tomatoes, peppers, asters and phloxes are transplanted for the third time into these boxes, and I get from three to five cents apiece for them, whereas if I sold them out of flats I would only get fifteen cents per dozen. As to the cost of this box: The material is such as is used in making the common market basket. Have it cut two and one-half inches in width and six and one-half inches in length, tapering on the sides from each end for two and one-half inches, thus leaving the center one and one-half inches square. Now score them for folding. To put all together take a three by three quartering, any length you wish, tapering the end to correspond with the taper of the box. Fasten a plate of iron on the top so that the tacks will clinch. Make a hoop of wire to slip over the end to hold the splints while the hoop is wrapped and nailed. The hoops should be three-eighths of an inch wide and ten inches long.

Made in this way the boxes will nest together, and can be made at any time for future use. The cost will not exceed 25 cents per 100 boxes. Material can be had at any basket factory.

Such a box can be used for layering strawberry plants. It makes a cheap, neat package, and people like to buy plants put up in this shape. They can be then transplanted into the garden without a setback. I put up thousands of tomato plants in boxes, each holding half a dozen or a dozen, and also do up single plants to put on the market. Vegetables grown in pots are too expensive to the grower. This box is also a package that your customer can take home easily, and he does not have to set it out until his soil is in a fit condition. There is no patent on this—I give it for the good of the plant culturist. As shown in the sketch the plant is small for the size of the box.

E. W. TURNER.

Newton Falls, Ohio.

Green pea tops, when young, have been advocated as a substitute for asparagus; but how they can be said to be a substitute for that vegetable passes our comprehension. It is also advised that they should be used in soups in early spring. Undoubtedly for this purpose they will answer admirably. Grown in boxes in a pit or frame until they reach the height of 5 inches or 6 inches, they certainly produce a very delicate and tasty vegetable for flavoring. The suggestion might be adopted with advantage.—Fruit Grower, etc. (Eng.).

## Destructive Insects and Methods for Controlling Them.—III.

### The Plum Curculio.

PROF. W. G. JOHNSON.

The plum curculio is thought to be a native American insect, and has for many years been a ravenous pest in our orchards. Of fruits, perhaps, the plum and peach suffer more from the ravages of this insect than from any other pest. It has been particularly destructive to peaches in Eastern Maryland and Delaware during the past season.

#### Life History.

The parent insect, or the one responsible for the wormy fruit, is a beetle, and belongs to a family known as curculios, weevils, or snout beetles. It is a small, grayish or blackish beetle with a rather hunched back, about one-fifth of an inch long, as shown in the accompanying illustration. It passes the winter as an adult beetle under loose bark, rubbish, or, in fact, in any secluded spot where it can find protection and shelter.

Very shortly after the young fruit is formed on the tree the female insect appears, and, alighting upon a plum, she makes with her rather long snout a hole about one-sixteenth of an inch in depth in the fruit. She then lays her egg in this cavity and pushes it with her snout to the bottom. When this is done she cuts the characteristic and familiar crescent-shaped slit in front of the hole, so as to undermine the egg, and leave it in a sort of a flap, her object apparently being to wilt the piece around the egg and thus prevent its being crushed by the growing fruit. It is thought that a single female will deposit from fifty to a hundred eggs, laying from five to ten a day.

The egg can be seen distinctly with the naked eye by lifting the "flap" with the point of a knife. It is oval, somewhat oblong, and pearly white in color. In warm weather it hatches in three or four days, but oftentimes remains a week if it be cold.

The very small, soft, footless grubs feed for several weeks, usually from three to five, cutting a channel to the pit. The irritation arising from the wound and the gnawing of the grub causes the fruit to become diseased and gummy, and it falls from the tree before the worm is quite fully grown. When mature the worm leaves the fruit, burrows in the ground to a depth of from four to six inches and makes a little cell, in which it transforms into the pupa stage, as seen at "b" in the figure. From these pupae the beetles appear in from three to six weeks, and hunt up their winter quarters almost immediately, and are not seen again until the following spring.

#### Remedies.

When the beetles first appear in the spring they feed for a time upon the unopened buds, and later upon the young leaves of the plum, peach, apricot, cherry, apple, pear and possibly other plants. Taking advantage of this habit, many of the adults can be destroyed by the early spraying with paris green in water or by Bordeaux mixture.

The worms, or larvae, are beyond the reach of all insecticides, and therefore can be destroyed only by persistent and thorough gathering of all fallen fruit at frequent intervals throughout the early part of the summer. It is not an uncommon practice to turn chickens, turkeys, hogs, sheep, etc., into an orchard in order to have the fallen

fruit devoured. As a rule apples and pears do not drop as a result of curculio injury.

When the beetle is alarmed it folds its legs close to its body, turns its snout under its breast and suddenly falls to the ground, remaining for some time motionless, as if dead. By taking advantage of this peculiarity the beetles can often be collected in great numbers by jarring the trees, and collecting them on sheets or anything made for that purpose. There is on the market an excellent contrivance known as Hull's curculio catcher. It consists of a wheelbarrow, on which is mounted a large inverted umbrella split in front to receive the trunk of the tree. The machine is provided with a padded bumper, and can be driven against a tree with great force.

As a preventive measure a plum orchard should not be planted near a wooded tract, as this affords excellent winter quarters for the beetles, also avoid giving them the chance to shelter in an orchard which results from leaving rubbish of any kind around.

#### Natural Enemies.

The curculio has several natural enemies, but none of them seem to appear in numbers sufficient to do any appreciable good in keeping the pest in check. Of these, perhaps, the ground beetles are the most beneficial. These large blackish beetles can be seen running here and there over the ground whenever a board or stone is turned over.

FIG. 61.—PLUM CURCULIO.

Taking it all in all, we must rely upon artificial measures for the destruction and suppression of this ravenous pest. Persistent and universal practice is desirable to obtain the best results.

#### Orchard Pests in California.—

The last report of State Horticultural Commissioner A. D. Pyral is in a joyous note: "Most of the orchards show a marked improvement over what they were a few years ago; they are generally free from injurious pests. The Australian ladybird (*Vedalia cardinalis*) *Rhizophila ventralis*, *Novius Koebele* and *Orcus Chalybus* are gradually destroying large numbers of the pests destructive to plant life. It would be well to devote a great deal of attention to the increase of propagation of these beneficial ladybirds. The Anguillula or Root Knot disease is yet unknown in this country. Fruit growers should discourage the importation of fruit trees from the Eastern States and decline to receive trees from any county, State or country that is known to have diseased trees or insects that are injurious to plant life. I have not found any new pests in the orchards inspected."

**Flowers in Sicily Isles.**—A recent number of the "Strand Magazine" contains a gossip article on the Isles, with special reference to their famous nurseries. The largest consignment of *Narcissus obvallaris* ever sent from the islands at one time was dispatched in the beginning of February from St. Mary's, in all 5,000 bunches, or 60,000 blooms, and from two other growers about the same quantity. The demand for this flower is very great in English markets.

## The Fruit Garden.

**Raspberry Supports.**—A good support is made for these by driving in light locust or cedar posts fifteen feet apart so that they are three and one-half feet out of the ground. Then run one galvanized wire twenty-two inches from the bottom, and another on the top of the post, fastening with staples.

**Trimming Raspberries.**—The weakest canes should be cut back and tied to the bottom wire, and the others cut to six inches above the top wire. This will give plenty of fruiting cane, if they are laid in at from eight to nine inches apart. Cutting half the canes at the first wire will distribute the fruit and give the line a better appearance than if all canes were cut at one height. The tying material, if Raffia, should be light—only of sufficient strength to hold the canes in place until the fruit is gathered. Select canes directly under the wire. This point should be borne in mind when cutting out the old canes directly after the fruit picking is finished, also at that time remove any surplus suckers.

**Diseases of Raspberry.**—These are Anthracnose, Orange Rust, and Blight. The first-named shows on the young growing canes, as minute grayish spots with a dark outline. The spots extend, and meeting others, form blotches or scabs, which live on the canes through the winter. Result: Girdling of the canes and therefore withered fruit. Remedy: Spraying the young growth several times with Bordeaux mixture. Orange Rust shows as an orange-colored dust (spores) on the under side of the leaves, also a common disease of the blackberry. Remedy: Dig out and burn every plant. Blight is similar in appearance to the pear blight. Remedy: Cut out and burn the diseased parts.

**Strawberries.**—Where the weather is open and the frost all out of the ground, see that the mulching is not too heavy on the rows after the plants begin to grow. For single lines I simply go over the lines and divide enough of the covering with the hands, so that the leaves can push through. Some growers believe in planting new beds as soon as the ground can be worked. I don't; when I can get a crop of Al berries in ten months from planting.

**Ordering Fruit Trees.**—I would caution the amateur against buying "Those fine large trees, ready to bear right off." It is much better to get the healthy straight whips, and head them away back. A heart-rending operation, I know, but a very necessary one for the good of all fruit trees, and especially so in regard to the peach, plum, nectarine and apricot.

**Nut Trees.**—Have you any? If not, get a few. Some can be found to suit your place, among the many being walnuts, hickories, chestnuts, filberts and pecans. The market cannot be said to be overstocked with nuts when the imports of walnuts and filberts alone reach something like 10,000,000 pounds a year.

J. HOLLOWAY, L. I.

## Truck Farming.

Truck farming means intensive, high farming. Lands dedicated to truck must be heavily fertilized, not with commercial fertilizers only, but with such home-made manures as will insure large supplies of organic matter. The frequent incorporation of vegetable matter by the growing and turning under of some leguminous crop, supplemented by mineral manures, will in a few years render these soils adapted to truck growing.

If stable manures be used they should first be thoroughly composted and several times piled and cut down, in order to bring them into a most available condition as plant food. A compost of stable manure, cotton seed, acid phosphate and kainit, mixed in such proportions as will suit the crop to be grown, will be found a very effective fertilizer, perhaps superior to any other mixture.

Proper rotation must be observed in truck growing as in general farming. Melons, cucumbers and squashes belong to one family, and should not succeed each other. Egg plants, tomatoes and Irish potatoes form another; and beans and peas another.—*La. Expt. Stn. Bulletin.*

### A Simple Plan for Home Grounds.

In the presentation of the accompanying plan it is hoped that its simplicity is such as to make it appeal to those who wish to have some properly developed ground at a minimum of trouble or expense. While it does not aim at any very elaborate effects, yet it will be found to contain all essentials of balance and artistic requirements as well as ample provision for utility; and this last so provided for as to be absolutely unobtrusive to the visitor. The plan, while having been prepared for actual use by Mr. Jos. Forsyth Johnson, landscape gardener, contains sufficient suggestion to enable any intelligent person to adapt it to his or her own requirements, hence its publication here.

It is not necessary to enter into a very detailed explanation of the construction, for it is simplicity itself and can be gathered from the design. However, it will be as well to draw attention to some of the chief points of value claimed. Primarily, and this is a point very often overlooked in combining grounds with the residence, provision is here made by placing the entrance to one side to avoid cutting up the expanse of garden ground as far as is possible; and in fact the entrance road or driveway is reduced to its smallest possible limits. If the chief entrance to the house be brought at the front, it is an impossibility to make any pictorial effect out of the ground lying between it and the boundary. Again, if the servants' entrances be entered directly from the back, it is impossible to make the best use of the surroundings of the house. Therefore, in this arrangement the servants' entrances are placed at the side beyond the clump of evergreens which will be seen immediately to one side of the main entrance, and which acts as a screen at all times of the year. At the same time a view of this clump is caught from the roadway entrance, and gives an air of comfort and repose to the approach.

Having secured for the house a pretty surrounding, it is important to give the house itself a suitable setting, for which purpose the "Terrace" around it has been arranged, from which also a general survey of the surroundings can at all times be had. At B is a closed-in drying yard conveniently placed, yet out of view; the walls facing on the entrance driveway could be very suitably covered by some creeper, or vines on trellis.

Immediately beyond the drying yard provision is made for the stables, having the driveway continued right under cover, and through into the open yard D beyond. This space is conveniently placed for the reception of manure from the stables; here it can be handled until such time as it is wanted in the kitchen garden and fruit grounds beyond, and to which it can be hauled with the least possible labor.

The mass of shrubbery shown on the right of the yard D is a suitable break to prevent a full and free sight line into the kitchen garden, and also screens the yard wall. Adjoining the house is the conservatory, which can thus be approached directly from the house at all times of the year—a very important consideration during the severe cold weather. Continuing in the same direction in the space marked A, a stove, or hothouse for grapes, may be provided for, and the same system of heating could be used for all the offices grouped around here. The stove hole entrance could very conveniently be placed in the corner of the stable yard or in the drying yard.

Referring now to the grounds: as shown on the plan, directly on the right side of the house, provision is made for the small flower garden, which could be reduced or extended according to fancy. Its proper place is, however, somewhere as shown, a; there the beds, more or less formal, serve as a connecting link between the easy style of the garden proper and the more or less formal architectural features of the house and conservatory. The bushes, beds, and trees shown with some idea as to their relative heights, are so arranged as to produce the effect of extended area by leading the sight on to the furthest objects, yet without having the appearance of stepping stones, and not specifically

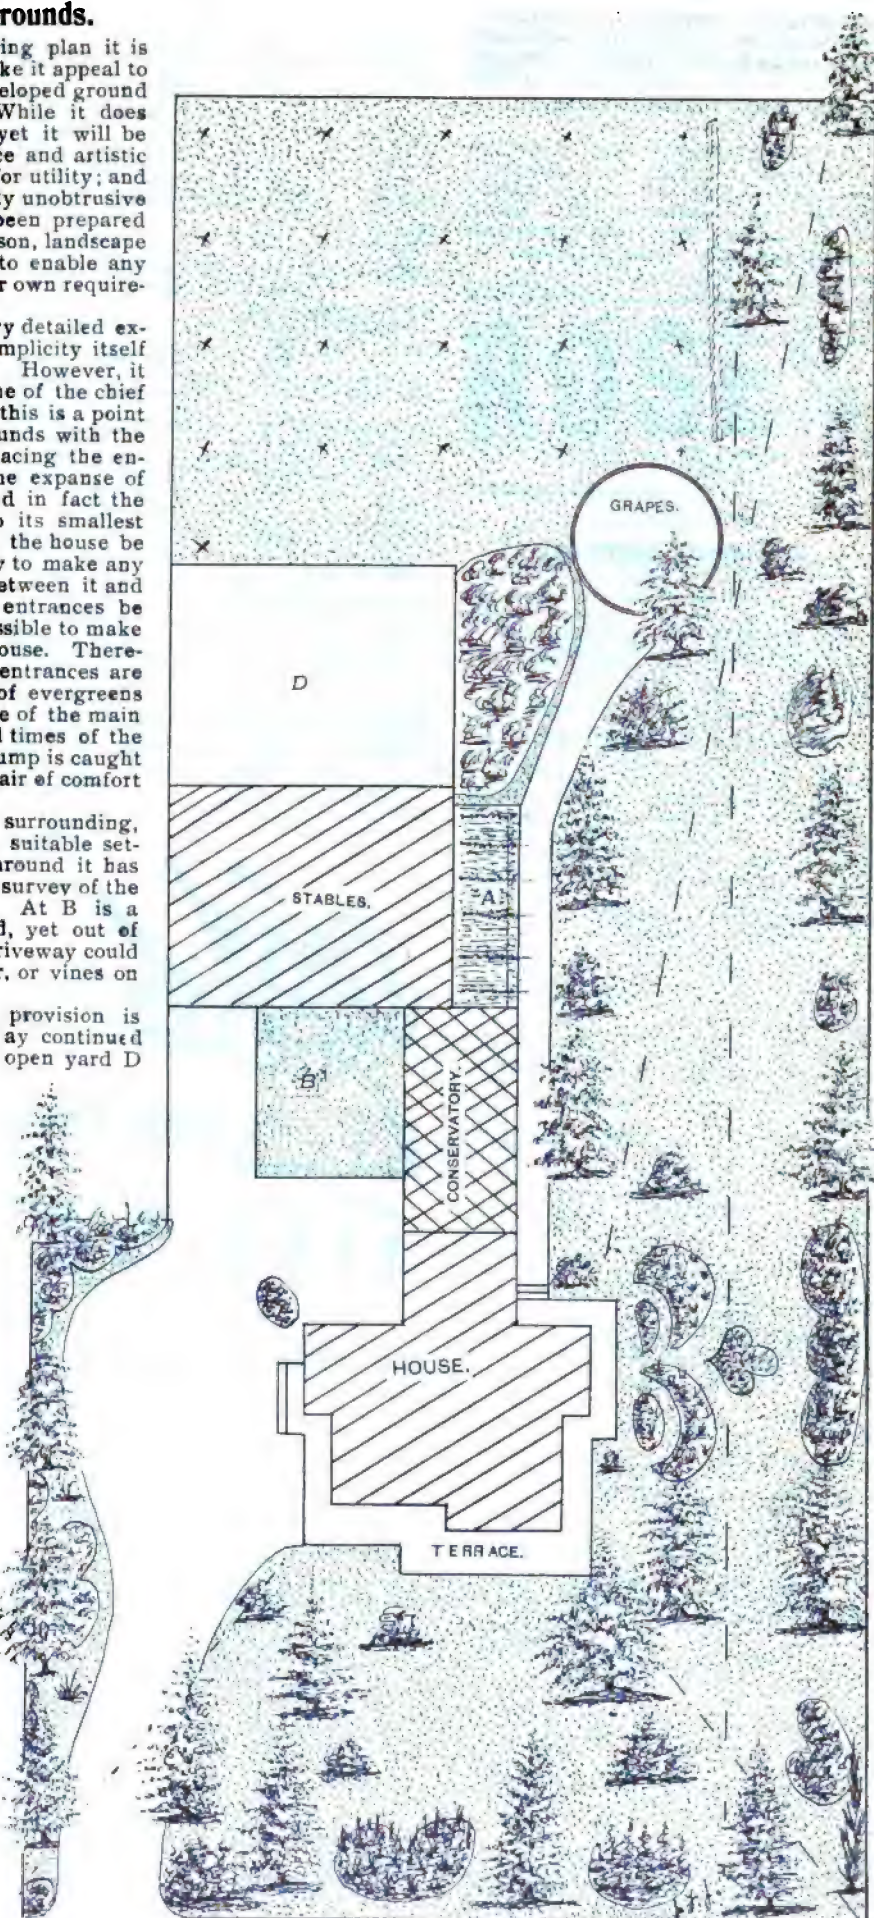

FIG. 62.—SIMPLE PLAN FOR HOME GROUNDS.  
(Space 100 ft. front.)

denoting the boundary. The dotted lines carried across the plan in various directions are designed to illustrate the principal views which it has been intended to keep open, and thus add to the artistic effect.

A very little consideration on the part of the reader will explain the reasons for the existences of the various groups, etc., in the places shown; thus, for instance, opposite the flower garden the mass of shrubs is placed to secure, not only privacy, but from its intensity of greenery to serve as a suitable background for the flower beds to heighten their color effects. Of course, these various masses of shrubs can have herbaceous perennials, bulbs, etc., permanently planted on their margins, and the same treatment may also be given to the strip of ground on the left side of the entrance driveway.

LEONARD BARRON.

### A Topical Summary.

As this issue of "American Gardening" will be seen by many who are not, as yet, subscribers and regular readers, we give the following Topical Index of some of the more important articles which have appeared in previous numbers of this year's volume. This is done to serve as a guide to the general tone of subjects treated.

#### REGULAR CONTRIBUTIONS.

Seasonable culture of Fruits, Vegetables, Forcing House, Lawn and Flower Garden, Amaryllis, Window Garden and Poultry Notes; Current News; Market Reports; Doings and Meetings of Horticultural Societies, Private Gardeners, etc. Also descriptions of Estates, Novelties, Tools, etc. (illustrated as necessary).

#### FRUIT AND VEGETABLE GROWING, MARKET GARDENING, ETC.

FIG. 63.—COMBINATION DRILL AND CULTIVATOR.

### Combination Drill and Cultivator

Modern, economic and profitable garden culture demands that everything be planted in long rows rather than in the small square "beds," as was formerly the practice. This style of planting makes the use of garden tools profitable, and cuts off the expensive element of hand culture. We present herewith a cut of a combination tool that meets every requirement of this plan. It represents the New Universal Model Combination Drill, manufactured by the Ames Plow Company, of Boston and New York. The upper half of the cut shows the machine as a double wheel seeder, and below it appear the attachments for converting the seeder into a cultivator. The change from seeder to cultivator is quickly and easily made, and the construction of the attachments is such that they will cultivate every variety of garden crop. The drill will sow all varieties of garden seed, never failing to drop and cover the same. A very small garden may adopt this tool with profit.

Do you attend the farmers' institutes once a year? Readers say *The Rural New-Yorker* is a farmers' institute every week. We can send it and AMERICAN GARDENING, both one year to your own fireside, where every member of your family will have the benefit of it, for \$1.80.

# Purify

Your blood with Hood's Sarsaparilla at this season. Expel the impurities, prevent and cure spring humors and that tired feeling.

## Hood's Sarsaparilla

Is sold by all druggists. \$1; six for \$5. The best spring medicine.

Hood's Pills are the only pills to take with Hood's Sarsaparilla.

## MARKS' Patent Artificial Limbs

(PATENTS OF 1893)

With Improved Rubber Hands and Feet are Natural in Action, Noiseless in Motion, and the Most Durable in Construction.

It is not unusual to see a farmer working in the fields with an artificial leg, or an engineer with hand on the throttle, or a conductor, brakeman, fireman, carpenter, mason, miner, in fact men of every vocation, wearing one or two artificial limbs, with rubber feet, of Marks' Patents, performing as much labor as men in possession of all their natural members, earning the same wages; in fact, experiencing little or no inconvenience.

Over 18,000 in use, scattered in all parts of the world. Eminent surgeons and competent footmen can make the Rubber Foot and Hand for their many advantages. At every industrial exhibition where exhibited they have received the highest awards. They are endorsed and purchased by the United States and foreign Governments. A Treatise, containing 644 pages, with 88 illustrations, sent FREE, also a formula for taking measurements by which limbs can be made and sent to all parts of the world with full guarantee. Address

A. A. MARKS, 701 Broadway, New York City. Established Forty-four years. Mention American Gardening when you write.

## BERRY BASKETS AND CRATES

of all kinds. Also material in the Flat. Write for Catalogue and Price List.

### WEBSTER BASKET COMPANY.

WEBSTER, Lock Box 43, Monroe Co., N.Y. Mention American Gardening when you write.

**Cedar Oil Soap** is the best all-around insecticide for house and greenhouse use. Kills scale, thrip, spider, mealy bug, fly, etc. The best preventive if used often as a wash; keeps foliage bright and clean. Kills fleas on dogs, cats, fowl, etc.; on rag mangle. Put up in pound tins, 50 cts.; half pounds, 25 cts. each. Sold by Seedsmen and Florists. Half pound trial tin mailed on receipt of 25 cts., enough for two gallons solution. Address the Manufacturers

AUGUST ROLKER & SONS.

P. O. Station E. 126 W. 21st St., New York. Mention American Gardening when you write.

## FARMING DON'T PAY.

So says Jones, and he resolves to become a "manufacturer." He buys a fence machine, a "county right," etc., and starts in to compete with steam and capital. His neighbor Smith invests same amount in "feeders," thus realizing a good price for his crops, enriching his farm, and enabling him to "lift the mortgage" and fence with Page, while Jones "goes to the wall."

PAGE WOVEN WIRE FENCE CO., Adrian, Mich. Mention American Gardening when you write.

## Lawn and Flower Garden.

**Arise.**—Winter's rest is almost at an end, and if the "resting" time has been spent to the advantage of horticulture, there ought to be a considerable fund of knowledge stored away and developing into new experiments which, it is hoped, will give better returns for the labor expended. A careful horticulturist always sees work ahead, and if advice has been followed there should be no shortage of compost or good planting soil. Lawn mowers and garden utensils are in proper condition; in fact, everything is in such a shape as to be ready to be put into use directly it is wanted.

**Protected Plants.**—The herbaceous border must not be overlooked. In places here and there the storms of winter have removed the covering, which must be replaced at once for this alternate thawing and freezing is more dangerous to our plants than is the extreme cold. Our tender shrubs and conifers must also be looked to for their covering. Evergreen herbaceous plants should receive attention during wet weather by having the covering removed from them to prevent rotting. If covered by a wooden box or loose boards even, there is not so much danger of their decay.

**Lawns.**—Manure that was hauled on to the lawns during cold weather, and which consequently has remained in lumps should be raked uniformly over the lawns as soon as the weather permits. The spring rains will then have a better chance to wash down into the ground the food ingredients and there will be but little material left to be raked off later on.

**Alterations.**—Where changes in the flower garden were not accomplished last fall there has been during the long winter evenings plenty of opportunity for working out new plans, but a warning is not out of place. How often one sees too much flower bed and too little lawn. The effect is unsightly and in bad taste. Is there anything of greater beauty and of more perfect harmony with the surrounding buildings than an open lawn of fine mixed grass, bordered by trees and shrubs properly grouped, and with here and there in suitable places clumps and borders of herbaceous perennials? Not that I deride bedding plants; on the contrary, I use thousands upon thousands of them every year and I admire them—when used in their right place! It is an impossibility to display a flower bed to full perfection unless it has a fine stretch of green sward as a groundwork, and why treat to its disadvantage the plant of which you think so much. Put it where it properly belongs and where it can show its full beauty either in flower or foliage. So place it or leave it alone. I have seen gardens entirely of flowers, not a blade of grass, and these no small gardens either, but in almost every instance it has been the work of some eccentric woman.

**The Average City Garden** is undoubtedly too small for bedding plants to be used in it. Here they should be confined to a vase or two, or in some instances, perhaps, in a border, or an oval bed at the intersection of the walks. Let us leave greenhouse plants for portico decorations if the necessary work has not been done by the hardy vines, or for window boxes, and indeed this last scheme is to be more encouraged, for to many city people it is their only method of being able to enjoy a few flowers during summer.

**Order at once trees and shrubs.** Personally I prefer buying in the fall. The stock is then root pruned and heeled in. By spring the roots have callused and are ready to make active growth. Moreover, it is far more handy to pick out of the rows what is wanted in place of waiting for the nurseryman and then too often receiving the plants when the leaves are almost fully developed, which is certainly not to the best advantage of either the tree or the purchaser.

**Seeds.**—A number of seeds must at this time be put in the seed pans, with more to follow on. Hot bed sash needs looking after, for the hotbeds themselves will have to be put into use. J. JENSEN, Chicago, Ill.

We tell your doctor all there is in Scott's Emulsion, just how much cod liver oil, hypophosphites, glycerine. But we do not tell him how these are combined. You have your secrets; this is ours. This knack of making the very best thing has come to us from years of experience with just one thing. We make only Scott's Emulsion—all our energy is bent on making that better than any other emulsion in the world. We have no other business thought. Is it any wonder that it is the standard?

SCOTT & BOWNE, Chemists, New York.

**CANTON GARDEN PLOW**

THREE SHOVELS  
AND RAKE  
ATTACHMENT.

## THE WM. H. MOON CO.

Glenwood Nurseries, Morrisville, Pa.

Offer, for the SPRING OF 1897, a Complete Assortment of

## EVERGREEN AND DECIDUOUS TREES,

Flowering Shrubs, Grasses, Dahlias, Climbers and Climbing Roses.

Special attention is called to the following.

Chestnuts, large varieties Numbo and Paragon.  
Asparagus Roots, strong 2-year olds, Palmetto.  
Barr's Mammoth and Conover's.  
Strawberry-Raspberry, a Japanese Novelty.  
Burbank's Golden Mayberry.  
Industry Gooseberries and Fay's Prolific Currants.  
Purple-leaved Beech, 4 to 6 feet.  
Elms, American and English.  
Horse-chestnuts, Lindens and Magnolias.  
Maples, Norway, Sugar, Sycamore, Ash-leaved and Silver-leaved. By the thousand, from 6 to 12 or 14 ft.  
Oaks, English, Pin, Mossy Cup, Red, Scarlet and Turkey.  
Poplars, Carolina and Balsam.

Willows and Weeping Trees, in variety.  
Hedge Plants. Evergreen and Deciduous varieties, including 200,000 California Privet, from 1 to 5 feet.  
Evergreens, Arber Vitis, dwarf and tall growing sorts.  
Nerdsman's Fir, from 1 to 3 feet.  
Balsam and European Silver Fir.  
Hemlock, Colorado Blue, Norway and White Spruce.  
Retinosporas, in variety of all sizes.  
Pines, White, Scotch, Austrian and Dwarf.  
Evergreen Shrubs, including Mahonias, Hollies and Rhododendrons.  
Deciduous Flowering Shrubs. General assortment of various sizes.

DESCRIPTIVE ILLUSTRATED CATALOGUE of 48 pages, containing prices, etc., to be had on application. Correspondence solicited.  
Mention American Gardening when you write.

## New Single Violets.

Princess of Wales, Princess Beatrice, Admiral Aveilan. \$1.50 per doz.  
Luxonne, Petit Blue. \$1.00 per doz.

My plants are all perfectly healthy, and have all been grown cold, insuring strong, healthy growth. Older varieties such as Chambrom, etc., prices on application.

FRANCIS SUPLOT,

57th and Lancaster Avenue, Philadelphia

## ROSES

\$3.00 per doz., \$20 per 100.

Large 2-year old, field-grown plants that will bloom this summer. Best sorts, true to name. Write for catalogue.

**W. E. WALLACE,**

Nurseryman. Hartford, Conn.

## ••MANWELL STRAWBERRY••

The verdict given by competent judges. Prof. Budd, Iowa Hort. Station, says: "Have fruited it two seasons, its perfect foliage and capacity to resist drought, makes it very desirable. It bore more good fruit than Parker Earle, Beder Wood, Warfield or Haverland." John Wragg & Sons, Wankee, Iowa, says: "There is no doubt it will be one of our very best varieties for shipping, and I think it the richest berry I have eaten of over a dozen of our best varieties; the plants are fine." R. M. Kellogg, Mich., says: "I am fully persuaded you have a grand berry. It is surely taking a lead in my trial plot; the quality and the color of the berries are superb and the vigor of the plants is simply splendid." C. G. Patton, Nurseryman, Iowa, says: "Its good size, bright color, firmness and quality combined give it high rank among strawberries, and being a strongly staminal variety, with the bearing quality that it has, makes it just what we have been looking for." Send for catalogue of plants and runner cutters to ALLEN D. MANWELL, P. O. Box 665, Vinton, Ia.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1896.

PUBLISHED BY

A. T. DELAMARE PUBLISHING CO. LTD.

ROSE AND DUANE STS.,

RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt.

P. O. Box 1697.

## Publishers' Announcements.

Cheques, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per agate line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**Potato Scab and a New Remedy.** THE scab disease of potatoes causes annually an enormous loss throughout the country, and the fact that ground on which the crop is scabby one year is infected with the germs of the disease which will necessitate its being used for some other crop the next year, is an important factor in some sections where it is not customary to follow a strict rotation.

There have been various trials of germicides and antiseptics as preventives of the disease, but potato growers have generally followed the practice of soaking the "seed" for a couple of hours in a solution of corrosive sublimate, a substance which, while most effective as a germicide, demands that it be handled with great precaution because of its very dangerously poisonous properties. However, its use has been rapidly and largely extending, and we have not hesitated to advise its employment whenever asked to prescribe for potato scab. Dr. Byron D. Halstead, of New Jersey, in the year 1895, made a series of trials which led to the conclusion that flowers of sulphur dusted in the rows acted most beneficially as a preventive,\* but we do not know that any extended trials with this material were subsequently made.

In the search for a preventive it is

highly desirable that some less dangerous body than corrosive sublimate be discovered, and it is, therefore, with much delight that we note Dr. J. C. Arthur, botanist at Purdue University, reports favorably on the use of formalin,† a substance which has been largely experimented with of late as an antiseptic and germicide by physicians and biologists generally in hospital and laboratory practice, and which has given much satisfaction. As this substance is not dangerous, not expensive, and is a powerful germicide, the preliminary notice just issued is an important vindication of Experiment station work. Further information is promised shortly; in the meantime the following quotation will explain the method of use:

"Eight ounces of the formalin are added to 15 gallons of water, and in this the seed potatoes are soaked for two hours. After being taken from the bath they can be cut and planted as usual, either at once or after some time. Formalin is not corrosive, and so can be used in any kind of vessel, and not being poisonous, there are no particular precautions to be observed. It does, however, make the hands smart if there are any raw spots, and the fumes irritate the eyes and throat. But these are only slight annoyances."

**Economy** ON the first page of this issue is presented an illustration of Space. tion of pear trees trained "en cordon." The system is one that, while not absolutely unknown in this country, is at all events not much practised; yet we venture to believe that there are many instances where such a method could be adopted, to very great advantage of the cultivator. The system has come to us from France, where it is quite a feature in the fruit gardens, and has found favor with certain amateurs in this country.

One of the most absorbing questions of to-day is how best to utilize the space at command so as to produce from the soil the greatest possible results from the smallest possible areas—a problem which is felt in its greatest intensity in the immediate neighborhood of the larger cities, and it is in such places that the cordon trained fruit trees may have a very useful future from the fact that a very large number of varieties can be thus grown together in a very small space; and, indeed, for the testing of varieties it would be hard to think of a more suitable plan. The trees are kept within reasonable bounds, 50, 100 or more can be seen at a glance, and careful comparisons facilitated.

While advocating the adoption of the plan in testing grounds and by the amateur, we fully realize that in a very large proportion of the area of this vast country the necessities for such a course do not arise, or, at all events, have not yet arisen, as they have in foreign lands. The difference between the methods of culture adopted in America as compared

with those of Europe, more particularly in France, are due to the fact that, in these latter, under the most intense system of cultivation, close cropping is carried down to the extreme point, and the land itself is also divided into very small areas under the cultivation of different individuals.

"La petite culture" is a feature of French cultivation with which we in this country are not as yet familiar. It has been brought about by the successive dividing up of the paternal estates among the heirs during a length of time. Who knows, however, but that the time is not far distant when in the neighborhood of great centers of population the system which has been evolved by the social conditions in that country will find its counterpart with us? Already, indeed, the pressure is felt. Intensive cultivation is the key-note of the American agriculturist's and horticulturist's progress, and is it not reasonable that we shall adopt, if not in its entirety, at all events in some portion, the lesson taught by nations elder than ours? Have not the signs of the times been that the methods of the horticulturist must become more and more those of the farmer?

Among the large army of horticultural amateurs whose inclinations would lead them to do more than the space at their command, and the leisure which the demands of business will allow, these methods, which may be included under the comprehensive term of "intensive cultivation," must find more and more favor as time rolls on. Certain it is that in the suburban districts there are hundreds, nay thousands of lots where the resident is also the owner in which a host more varieties of fruits could be included than is the case now under the present regime of the standard trees. Not only do the standards, by the size of their top, occupy perhaps 400 square feet of ground, but the shadow cast by the foliage, as well as the extension of the roots in the soil, precludes the possibility of cultivating to any extent close underneath; but by growing the trees to a single stem, as shown in our illustration above referred to, and which also allows of their planting sixteen to eighteen inches of each other, the possibilities of concentration are something immense. It is to be hoped that the subject now broached will receive a further elucidation at the hands of cultivators in all parts.

The matter is one for discussion. Will not those who have opinions to express let us hear from them?

## THERE'S MONEY IN IT.

"American Gardening" is worth several dollars a year to me, at least.—E. F. BABCOCK.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send the price to the Publishers.

\* AMERICAN GARDENING, Jan. 11, 1896, page 17.

† A commercial preparation of formaldehyde.

## English Varieties in America.

Your remarks under this heading in issue of Feb. 27 are very pertinent and of the highest importance, especially to gardeners who, having learned their craft "on the other side," come to this country, and naturally think they can grow here what they grew there. They certainly cannot, and I have had recent experience on this point.

### Potatoes.

On taking charge here I found last year a number of barrels of Windsor Castle, Snowdrop and Sharpe's Victor potatoes that were produced here the previous summer from stock imported early that year. Few were eatable and none of them were creditable samples of their kinds, although from familiarity with the varieties I can

friend gave me a dozen tubers when I was in England in February of last year. I planted them with extra care; they made the usual top and died off early, but I lifted not one as large as those that were planted.

It seems to me we have no early potato at all comparable in quality to the earlies grown in England, and if we are to have them they will have to be raised here. There is room for such, and every one who will take up potato raising along those lines—here is a chance and legitimate work for our experiment stations—will reap credit and confer lasting benefits all around.

### Strawberries.

Not only are English potatoes a failure, but English strawberries likewise. I found here last year some experiment rows of Royal Sovereign, Sir Joseph Paxton and Auguste Nicaise. Only the first named gave any promise at all, and bore a few fine fruits in June, but the plants grew smaller and beautifully less under the August sun,

## Giant Golden Day Lily.

In the accompanying illustration of *Hemerocallis aurantiaca* major is seen a half-sized sketch of the flower of this recently introduced Japanese plant. Few, indeed, are the plants which are more showy when properly employed in the garden than the Day Lilies, say as clumps in mixed borders or on the banks of some water pool. Almost any garden soil will be found suitable, and when such a gorgeous golden yellow flower as that of the one now seen can be had at so little trouble it is certainly worth a place in any garden.

## We Were Right.

Our readers will doubtless have noticed that the portrait of Secretary Wilson, published in our last issue, differs from the reputed likenesses given by many of our contemporaries. The solution of the discrepancy is very simple—other papers have confounded the present Secretary with the Congressman of the same name. We owe our portrait to the courtesy of the Secretary himself.

The following will serve to show what manner of man this is: The brothers, James and Peter Wilson, cast lots as to who should go to the war or stay at home and manage the farm. For family reasons both could not well be spared. His brother, Peter, drew the prize, as he phrased it, and went. When Peter returned James divided equally with him lands acquired, cattle, and everything, to the last cent, he having been wonderfully successful as a farmer during the four years of the war.

## Grafting Roses.

F. E. Palmer has made a hit in grafting roses which is worth relating for the benefit of those interested in the subject of grafted stock vs. cuttings. Owing to the ravages of the eel worm Mr. Palmer decided to import a few thousand Manetti stocks and see if these would defy the pest. It being May when the stock arrived, the first batch could not be expected to prove entirely satisfactory, owing to lateness of the season. However, the result was excellent and very encouraging even at that late date. This is his method of procedure: The stock is first trimmed, then the graft is put on, tied with raffia, and the whole dipped in a solution of the stick grafting wax. This does not hurt the plant in the least, as in about two weeks the tying material rots and falls away. After grafting the plants are potted in four-inch pots and kept in that state until time of planting into the beds. Side benches of a carnation house are utilized to stage the plants after being potted. No special treatment is required. With a little moss spread over the pots to retain the moisture, a percentage of 95 per cent. can be guaranteed, as there is no damping off or shriveling. The wood is obtained from old plants which, instead of being dumped after spring use, are taken from the bench and heeled in outdoors, together with the Manetti stocks, which have been already imported during the winter. The stock is kept in this condition until danger of frost compels the transfer to cold frames, so as to be able to commence the work of grafting early. At time of writing the stock for next season's use is being prepared. An early batch, now in four-inch pots, is immense, having four or five stout shoots and the red stems that denote vigor. But few suckers are seen, and these are soon crowded out when trimming the Manetti; the cuttings so made may be planted out so that these can in a short time be used and save buying a second supply. It will be seen that the cost by this system is practically nil, and the result is testified to by the splendid crops that have been cut and the repelling of those arch enemies, the grub and eel worm. W. M.

FIG. 64.—GIANT GOLDEN DAY LILY.

vouch for their being true to name. When potato planting time came I made up my mind to anchor my hopes in known and well-proved American kinds, but to experiment further with the English kinds, to see if they manifested any disposition to become acclimated.

When we came to dig them the last state of those potatoes was a deal worse than the first. In growth they were amazingly vigorous, and if you had judged from the tops of Windsor Castle you would have thought grand tubers must be underlying, but a more lamentable result I never saw. They were bad samples the first year, but infinitely worse as the result of the second year's growth, and I have thrown them away. Yet in England there is no better second early potato at this present day than Windsor Castle. I would place it at the top of the mid-season kinds on the strength of English experience.

Another test was with Sutton's A1, sent out last year, and of which a

even also strong runners that I had potted up to try for forcing. Before winter set in of 1,000 Royal Sovereign potted up I only kept 200, and had faint hopes of these. I threw them away this week. They were blind and flowerless.

Last year I also bought 100 Stevens' Wonder strawberry, having then the liveliest recollection of a visit to the originator's place in the south of England two years ago this very month, and where I saw 4,000 plants in fruit and many fruits of one and one-half ounces. I need give no details of my treatment here, for my 100 Stevens' Wonder are gone with the Royal Sovereign, and English strawberries will stay in England, as far as I am concerned.

By the way, we are all so apt to speak of our successes, but does not a record of our failures need to be made as well? There is no disgrace in admitting them when they serve as index fingers to others, pointing out plainly what not to do.

A. HERRINGTON, Madison, N. J.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Treating Potatoes for Scab.**—The questions have been asked how to treat potatoes for scab with bichloride of mercury (corrosive sublimate), is it a sure preventive? Does planting on the same ground successively tend to increase the disease? Dissolve two ounces of corrosive sublimate in two gallons of hot water and let stand six to eight hours; then add thirteen gallons of water, making the final strength, two ounces of poison to fifteen gallons of water; let the potatoes remain completely immersed in this for one and a half hours, take them out, dry, and cut for planting. Corrosive sublimate is a very dangerous poison and all tubers not planted should be destroyed in some manner so that nothing can eat them. I believe this is the most positive preventive known. I would not advise planting ground from which scabby potatoes have been dug, often than once in four years, as the spores will live in the soil.—L. S. SPENCER, Pesotum, Ill.

(Flour of sulphur dusted into the rows has been found an effective remedy by Dr. Halstead. Has any one else tried it?—Ed.)

**Casabanana Again.**—Casabanana was a common thing hereabouts eighteen years ago. No one mentions the small sort, and I do not know any one who has it now. But years ago it grew here. One vine covered two large peach trees. The flowers were large, like the Luffa, or dlahrag gourd. They began bearing earlier in the season, as early as June, I think, and kept on till frost. The fruits were no larger than a banana, and we used them green, cooked like squash. They were good, too. When ripe and yellow they looked and smelt just like a banana, and were preserved. Some people used them fried in butter. I have not seen any of the small ones for several years. The large ones do not bear as early nor as full as the small sort, nor are the vines or flowers as pretty, but for preserves they are the same. I think the best way to start them is to plant a seed in a small, thin, bottomless wooden box, and when it is warm enough, set the plant, box and all in a good rich hill (old manure is best), and give good support. One vine will cover a big place. Several years ago I sent to different seedsmen some seeds, and to a few some fruits of these casabananas, but if they ever did anything I never heard. I may here state that the preserves look and taste just like pineapple. The fruit gathered in November will keep good till March. If Northern people could get seed of the small, early-bearing ones, I think they could raise them as well as watermelons or cucumbers. Seeds of the casabanana were brought here thirty years ago from Honduras. I see the seed offered in but one catalogue, and that in Louisiana. I have not raised any for four years, but where they can be raised they are worth the little trouble.—MARGARET E. CAMPBELL, Louisiana.

**Myatt's Ashleaf Potato.**—In the issue of Jan. 16, page 40, Mr. Robbins writes about Myatt's Prolific Ashleaf Kidney Potato, replying to a former communication by H. P. Manton. I would state that I have grown about all the varieties of Ashleaf Potatoes and have always found them to be the first of all the earliest and of the very best quality. This is a well-known fact and never before have I heard anything to the contrary. Now here it is said they grew splendidly and gave a great crop of extra large tubers. This condemns the sample of Ashleaf potatoes. I have grown them in England and America, too, for over fifty years, and I must say they are the poorest croppers of all the potatoes I have known anything about. Here is my experience in England for one year only. A friend brought me a few of the new Ashleaf Kidney Potato, calling them Rosslyn Castle. He had received them direct from Ireland and could recommend them very highly. They were very good croppers, but reminded me of what your cor-

respondent states as "soppy" and "soggy," so bad, indeed, that we could not eat them. I would like H. P. to try again, getting his seed from a reliable house next time. Bear in mind the Ashleaf, or Walnutleaf, or Myatt's, is a very poor cropper, and it is for this reason that they are only grown by a few private families.—C. LONG, Rochester, N. Y.

**Myatt's Ashleaf Potato.**—Many thanks to G. M. Stratton, San Francisco, Cal., for the very interesting history of the grand old Myatt's Ashleaf. Perhaps it would interest him to know that I once lived on one of the Scilly Islands for a period of about three and a half years, where about fifty tons of this potato was planted annually for market, entire crop being marketed by middle or end of May. (Tubers planted in December.—JESSE ROBBINS.

**The Codlin Moth.**—On page 145 Feb. 27 of American Gardening J. R. Johnson recommends a barrel three-fourths filled with water, and a lantern hung over same, as a remedy for the codlin moth. Such a trap will destroy moths, but I have never yet found a codlin moth (*Carpocapsa pomonella*) attracted by a light. I have made this statement frequently and it has never been contradicted. Stick to spraying.—C. D. ZIMMERMAN.

**Toy Incubators.**—On page 159 (last issue) was a paragraph on this subject, which, owing to a printer's error, appeared without its concluding words and signature. The last sentence should have been: "Otherwise it will be merely money thrown away.—MYRA V. NORRIS."

**Coal Ashes for Lawns.**—In your issue of Feb. 20, page 127, W. G. Gomersall speaks of wood ashes for lawns, then says, "Coal ashes, too, make a good and valuable top dressing for lawns, especially for heavy soils." I burn hard (Pennsylvania) coal in hot air furnace (fire not out since fall, so no mixture of kindling or wood ashes). Result, with screening, a fine, dusty, purely coal ash. My yard was filled with a mixture of yellow clay and heavy loam, is well drained, but gets very dry and hard in hot weather. Would it be beneficial to top dress with above described ashes? If yes, how heavy a dressing and when should it be applied?—C. W. J.

"Coal ashes" added to such a soil as described would be exceedingly beneficial. The lack of potash would make no difference; such a soil should not require it. The ashes can be put on the land, three inches in thickness, either spring or fall. If done in the fall, plow or dig in with the ashes a heavy dressing of long manure, leaving the ground very rough. This will leave the ground open to the frost's action, which will disintegrate and make a friable loam out of the clay soil. Great care should be exercised not to work such a soil when it is wet, or it will take several years to bring it back to a good condition. For potatoes, the ashes are sown in the furrows half an inch thick. The ashes may be applied in the spring by spreading on the land before digging or plowing.—W. G. GOMERSALL.

**English Potatoes in America.**—Your article on page 142 was quite a disappointment to me, as I was intending to make another trial of growing Myatt's Ashleaf potato in this country, but I have neither time nor space to waste and so must reluctantly give up the hope. I would, however, very much like to know the name of the "possibly one exception" referred to in your article, and also seek information as to where tubers of same can be gotten.—JESSE ROBBINS.

—The possible exception referred to is a variety known as "Jumbo," of which the origin is doubtful, though reputed to be English Champion. It is described as coarse and has been dropped from cultivation for some years. So far as we can trace it does not appear in any list this year, but possibly some reader may have it, if so we should be glad to hear from him.—Ed.

**An Opinion on Free Seeds** is given by the secretary of the Colorado State Horticultural Board: "In the light of my experience, I feel it necessary to advise those who desire to be assured of results, not to trust to Government seeds."

## Business Cards.

Cards will be inserted under this heading at two cents per word each insertion, payable in advance; the address to be counted part of the advertisement.

**LAND DEVELOPMENT.** consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. J. O. Forsyth Johnson, P. O. Box 107, New York City.

**"FLOWER QUERIES"** New book on floriculture 10 Chapters, written in questions and answers, discussing 500 floral topics. Price, 25 cts. The COURIER, Box A, Chatham, N. Y. Mention American Gardening when you write.

## The Private Gardener and His Employer.

I was much interested in the paper of Mr. O'Mara, and still more so in the letters from Portia, and Timber Topper, on page 165. Allow me to take the latter's remarks from an employer's standpoint. I am sure this view will be of benefit to all.

We will first speak of the poor fellow who is out of place in consequence of the place being sold, or closed. This is usually the case when the owner has become tired of the extreme expense entailed, which is often owing to the ambition and want of practical knowledge in the gardener. He commences with his employer with a place containing fruit, a kitchen garden, lawn, some flower beds and one or two greenhouses; he immediately commences to increase the work, which necessitates employing more men. Beds are made in the lawn to be filled with bulbs, and with a succession of other small plants; a rose home is built, also an orchid house, perhaps a graper; tomatoes and other vegetables are to be raised under glass—all this at a large expense, more than would be spent if the gardener were working for himself. If he were in trade he would manage to be more economical, with quite as good results. Oftentimes he experiments and makes failures, but these are premiums to experience at his employer's expense.

All these possessions are very charming to one who is a lover of horticulture, and an employer like myself, and who is also willing to spend lavishly in this way, and if the gardener is willing to consult his taste in plants, etc., goes on with the improvements; but, on the other hand, after a couple of years, the expenditure is greater than the pleasure derived. Of course, the present gardener is not willing to grass over the beds, have the orchids sold, and the place made as it was while he remains. I have seen this happen again and again; the owner closed the place to get rid of a drain on his purse, which was without good enough results, and then recommenced to have very pretty, less elaborate grounds.

Now, permit me to say one line about the gardener's family, who usually lives in a cottage on the grounds. The wife either makes or mars her husband's career. I have often heard it said: "Smith is no good, but Mrs. Smith is so very nice; she keeps the cottage so neat and pretty, and the children are so well behaved." Or it may be (from the mistress of the house this is): "I cannot have those Smiths another summer. Mrs. Smith is such a gossip, and everything is so untidy around the cottage."

I cordially, I heartily applaud the idea of the gardener trying to interest his employer's family in plants and their cultivation. When it is so fashionable to do everything that is English, I much wonder that the American woman does not take up gardening. All English women are interested in it; even those of rank and great wealth often work in their own flower beds, tying up plants, pruning and so forth, and they can all understandingly discuss plant culture.—AN ORANGE COUNTY FRIEND.

## A Baffled Florist.

Now Gladys sends for catalogues  
 From seedsmen far and near,  
 And studies them with diligence,  
 As she does every year.  
 Most lovingly she turns the leaves,  
 And lingeringly she looks  
 At pictures of plants never seen  
 Except in seedmen's books.

A new kind of Chrysanthemum  
 Just fills her with delight.  
 A pictured Sweet Pea is a thing  
 To dream about at night.  
 And so fair Gladys turns the leaves,  
 And makes her mental choice,  
 And when she speaks of flowers, you hear  
 The love tones in her voice.

Well, when she's looked the book all through,  
 And made her little list,  
 She foots the figures up—and then  
 You see a sudden mist  
 Of fleeting tears in Gladys' eyes  
 Her order represents  
 An eighteen dollar outlay, and  
 Her limit's fifty cents.

—Somerville Journal.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### BOTTOM HEAT.

There is no denying that both seeds and cuttings will move a little faster if a trifle of bottom heat is applied. If it can be had even a portion of the time there will be appreciable gain. A simple way of attaining the desired object, without the trouble of manufacturing the necessary appliances, is to set the flats on a common, broad, flat stone, moderately warmed. This will hold mild heat for several hours, and can be reheated in five minutes when necessary.

### A "WINTER-BLOOMING" CANNA.

It was only by expectation, and not in actuality, a winter bloomer. In November it was bought as a "strong plant, ready for blooming," at double the usual price per root. It was recommended to bloom continuously throughout the winter and to furnish a display of brilliant flowers that would give more satisfaction than could possibly be gotten from the same amount invested in other plants or bulbs. It was also said to begin to bloom when from six to eight inches high. It has had the choicest position in the best south window, and by the first of March has just attained the to-be-desired six or eight inches, but even yet shows no apparent anxiety to bloom. Narcissus, Hyacinths, Jonquills, Frezias, by its side, all have come forward, given their wealth of bloom and sweetness, and are gone. Alliums are covered with pearly white blossoms, and promise thus to round out the season. But the Canna, so far as any return is concerned, has been a mere cumber of the ground, a standing refutation of the glowing statements made concerning it.

### COLOR AFFECTING QUALITY OF EGGS.

The battle still rages around the question as to whether that "rich brown egg" is really any richer or of better quality than the white shelled egg. Strange to say, only those who keep the brown egg breeds as a rule believe the brown eggs the richer. Most people see no difference, but a few consider the white egg of better flavor. One fair-minded breeder says that the dark eggs might be richer, from the fact that the fowls which lay dark colored eggs do not lay so many as those breeds which give white eggs. Since quality depends more on feed than breed, the fewer the eggs the richer, is his idea. Be that as it may, and be the difference wide, or none at all, if your market calls for white eggs do you supply them; if for brown eggs, make every effort to have them. But don't, as you value your customer's favor, supply mixed eggs. The customer doesn't know it, but he will invariably be attracted by the basket of evenly colored eggs, be they white or brown.

### COMPARATIVE SIZE OF BREEDS.

If a man knows about how heavy a fowl he wants there is little to hinder his having just what he wants. From the 20 ounce bantam to the 35 pound bronze turkey should be wide enough range for any reasonable individual. Between are the 5½ to 8½ pound Wyandotte, the almost any weight Leghorn, the 8 to 12 pound light Brahma, the 15 to 20 pound goose, and plenty of others.

### FINE NEW CARNATIONS.

Since, under right conditions, there are few finer window plants than the carnation, it behooves one to keep open eyes for all improvements therein. A year ago, at the meeting of the American Carnation Society, three sorts which gained official recognition and universal admiration were Jubilee, Flora Hill and Mayor Pingree, respectively, red, white, and yellow variegated. Jubilee is of magnificent color and a long keeper. This year at the society's meeting the six general premiums for best hundred blooms were taken by Flora Hill (white), Emma Woche (light pink), Rose Queen (dark pink), Jubilee (scarlet), Mayor Pingree (yellow variety) and George M.

## The Woman, The Man, And The Pill.

She was a good woman. He loved her. She was his wife. The pie was good; his wife made it; he ate it. But the pie disagreed with him, and he disagreed with his wife. Now he takes a pill after pie and is happy. So is his wife. The pill he takes is Ayer's.

Moral: Avoid dyspepsia by using

## Ayer's Cathartic Pills.

Bradt (white variety). All these are among the newest sorts. Quality alone, however, is not the only necessity for a window carnation. Persistency of bloom is always especially desired, and the length of stem so necessary to the commercial grower is only an added trial to the window gardener, who should look for low growing sorts.

### EARLY SEEDLINGS.

If the outdoor beds are to make any show during the early part of the season it is imperative that the advance window work should be well handled. It is quite time to begin this, for the seedlings to be used for outdoor bedding must have, first of all, an early start. Getting the plants up is, however, the easiest part of the work. Thriving, satisfactory plants, such as one can rely on, can result only from the best of treatment. There must be full light, abundant ventilation, light shading from extreme sunshine, and, with nearly all subjects, a cool temperature. The flats in which the plants are carried on should be rather narrow in order not to bring any of the plants too far from the light. They should be turned daily, also, that all plants may have as nearly an equal chance as may be.

### STRIKING CUTTINGS.

There is no better time of the year than March for striking cuttings from the general run of plants. There are two easy ways of managing this in window work, both of which allow of placing several cuttings in the same receptacle and thus saving space. Many plants, especially hard-wooded ones, may be rooted easily in water in full sunshine. Given time enough almost anything will root in a saucer of sand placed in direct sunshine and kept pretty moist. Cuttings may be stood quite thickly in such a vessel, but had better not be so close as to hinder free circulation of air.

### PRESCRIPTIONS FOR AMARYLLIS.

It is a rather noticeable fact that those who neglect their plants the most, or who know the least about growing plants, most often succeed with the Hippeastrum, commonly known as Amaryllis. Probably this results from the fact that neglect gives a chance for ripening the bulbs which those too well attended never get. The writer lately buttonholed two growers of these bulbs, commercial dealers, in the attempt to find out the last word on Amaryllis growing. The first said the chief cause of failure was improperly ripened, perhaps too quickly ripened, bulbs. The other, who considers that he knows about all that is to be known concerning these bulbs, said that they were pretty sure to bloom if you only kept them dry long enough. If they sulk, just keep them dry and in the light till they get over it, was his prescription.

### NITROGENOUS FOODS FOR FOWLS.

The list embraces milk, lean meat, peas, beans, wheat, clover and grasses. Feather-making and egg-laying both call for large proportions of this class of fowls.

MYRA V. NORRIS.

## Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

SUFFERN, Voorhies, Ill.—List of Field Seeds.  
H. W. LANDRETH, Battle Creek, Mich.—Seed Catalogue.

WOOD BROS., Fishkill, N. Y.—List of Plants and Rooted Cuttings.

WM. P. PEACOCK, Atco, N. J.—Descriptive Trade List of Dahlias.

C. L. BRUNSON, Paducah, Ky.—Price List of Cut Flowers and Plants.

J. JEROME SMITH, Wilmington, Del.—Descriptive Catalogue of Seeds.

T. R. WATSON, Plymouth, Mass.—Trade List of Old Colony Nurseries.

WM. BENNIE, Toronto.—Illustrated Catalogue of Seeds, Plants, etc.

VICK & HILL, Rochester, N. Y.—Wholesale Plant Catalogue, illustrated.

DEMING CO., Salem, O.—Illustrated Catalogue of Spray Pumps and Nozzles.

BUSH & SON & MEISSNER, Bushberg, Mo.—List of American Grape Vines.

CHARLES BLACK, Hightstown, N. J.—Wholesale Price List of Nursery Stock.

R. H. BATH, Wisbech, England.—Catalogue of Carnations, Dahlias, Roses, etc.

WM. C. BABCOCK, Bridgman, Mich.—Descriptive Catalogue of Fruits and Plants.

MISS EMMA V. WHITE, Minneapolis, Minn.—Catalogue of Choice Flower Seeds.

NANZ & NEUNER, Louisville, Ky.—Illustrated and Descriptive General Catalogue.

A. J. MCMATH, Olney, Va.—Price List of Strawberry Plants, Fruit Trees, etc.

J. ROSCOE FULLER & CO., Floral Park, N. Y.—Catalogue of Seeds, Bulbs and Plants.

C. HUMFELD, Clay Center, Kan.—Wholesale Price List of Plants and Rooted Cuttings.

POPE MANUFACTURING CO., Hartford, Conn.—Illustrated Catalogue of Bicycles, etc.

O. DICKINSON SEED CO., Salem, Oregon.—Price List of Vegetable and other Seeds.

NATHAN SMITH & SON, Adrian, Mich.—Descriptive Trade List of Chrysanthemums.

O. A. E. BALDWIN, Bridgman, Mich.—Price List of Strawberry, Raspberry Plants, etc.

J. E. JACKSON, Gainesville, Ga.—Catalogue of Useful Greenhouse and Bedding Plants.

INGLESIDE FLORAL CO., Alhambra, Cal.—Price List of Hybrid Gladiolus and Cannas.

G. HANCOCK & SON, Grand Haven, Mich.—Trade List of Rooted Cuttings, Carnations.

FRANK H. BATTLES, Rochester, N. Y.—Catalogue of Garden and Farm Seeds, illustrated.

WILLIAM G. MCFEAR, Princeton, N. J.—Descriptive Price List of Fine Chrysanthemums.

STUART & HAUGH, Anderson, Ind.—Price List Carnations, Roses, Chrysanthemums, etc.

THE GOULDS MANUFACTURING CO., Seneca Falls, N. Y.—Catalogue of Spraying Pumps, etc.

D. M. ANDREWS, Boulder, Colo.—Price List of Hardy Perennial Plants of Rocky Mountains.

FREDERICK W. KELSEY, New York.—Illustrated Descriptive Catalogue of Fine Nursery Stock.

ROYAL PALM NURSERIES (Reasoner Bros.), Oneco, Fla.—A Very Complete Illustrated Descriptive Catalogue of Tropical Plants, Orchids, Cacti and Miscellaneous Stock.

WEBER & DON, 114 Chambers st., New York.—Illustrated and Descriptive Catalogue of Flower and Vegetable Seeds, Plants, etc.

A full list of novelties is given, the best only being selected. A colored plate of canna John White accompanies the catalogue.

SUNSET SEED & PLANT CO., San Francisco, Cal.—An Attractive Catalogue of Seeds, Plants, Bulbs, etc. One feature is the photographic reproductions of plants from life. There is a full list of novelties, particularly of sweet peas. The open golden gate cover illustration is a beautiful conception.

THE DINGEE & CONARD CO., West Grove, Pa.—New Guide to Rose Culture; a very interesting catalogue of roses and other plants, the list of novelties of the former being especially valuable. The covers are handsome, bearing representations of new hybrid tea roses, "Coronet," and of "Princess Bonnie" and "Pink Souper." Charming colored plates of canna Flamingo, etc., accompany the guide.

JOHNSON & STOKES, Philadelphia.—Garden and Farm Manual. This is a handsomely gotten-up catalogue of vegetable and flower seeds, etc.; especially attractive are the photographic reproductions of the products, which embrace among others the Black Boulder watermelon, New Winter Queen celery, and the new branching asters and fringed hollyhocks. The list of novelties is very complete.

## SEEDS. BULBS.

1 Oz. ECKFORD'S SWEET PEAS,  
1 Doz. OXALIS BULBS, for borders,  
and your choice of 5 Packets of the following seeds for 15 cts.

Phlox Drummondii. Double Hollyhocks.  
Salpiglossis. Nasturtium.  
Larkspur. (Double). Cleome (Spider  
Nicotiana glauca. flower).  
Echinus (Castor Calceolais.  
Bean). Four O'Clocks.  
Morning Glories. Nigella.

STILL BETTER. For a club of 4 sent to one address, I will send all the above seeds and bulbs.

J. W. STEVENS, Hazleton, Pa.  
Mention American Gardening when you write.

VINELESS SWEET POTATOES, tubers and plants. "McKinsley's Choice," and (no one else has them), "Gold Coin Prolific," (genuine home grown, no Arkansas Yams). Address with stamp for full instructions, worth dollars. The only original introducer and grower. G. Camerer, Madison Ind.

Mention American Gardening when you write.

## MAULE'S SEEDS

Prices Cut in Half  
for '97.

The most complete and most beautifully illustrated Seed and Plant Book of the year, free to all gardeners who mention this paper. Address

WM. HENRY MAULE,  
1711 Filbert Street, Philadelphia, Pa.

Mention American Gardening when you write.

## SWEET PEAS FOR THE MILLION

In same size packets, the Seven Superb Sweet Peas described below would have cost \$3.10 in 1896, but are sold now for only 25 cents.

25 Cts. buys these Seven  
Superb Sweet Peas:

CROWN JEWEL. Pale standards, tinted and veined with violet-rose; the wings are creamy, slightly tinted with rose; a most profuse bloomer.

GRAY FRIAR. Entirely unlike any other Sweet Pea. A most beautiful watered purple on white ground, the heaviest coloring being on the back of standard. The flowers, of hooded form and large size, are borne three and four on a stem.

LITTLE DORRITT. Carmine-tinted pink; standard of finest form, large white wings, slightly tinted, the colors beautifully harmonized; a superbly lovely variety.

METEOR. Truly an exquisite variety. Standards bright orange-salmon, wings delicate pink, with slight veins of purple.

MRS. JOS. CHAMBERLAIN. The flowers are truly enormous, and produced generally three to four on a stem. The color is very effective—a white ground heavily striped and flaked bright rose; of fine form, very striking.

RAMONA. Grand flowers of very large size, borne three or four to the stem; color creamy-white, daintily splashed with pink.

"1897" Special Superfine Mixed. This mixture is composed of twenty-three of the finest New Large-Flowered Sweet Peas. It is a choice blending (each grown separately and mixed by ourselves), which can be easily recognized when in flower.

25 Cts. Buys all the above.—Seven full-size, separate packet, true to name as described, and mailed, postpaid, to any address.

For ONE DOLLAR we will send five complete collections as above (in all 35 pkts.), and give FREE as a premium one full-size packet each of CUPID and AURORA,—provided, it is stated where this offer was seen. Please try to get up a club of Five for One Dollar.

With every collection we enclose a copy of "How to Grow High-Grade Sweet Peas by the Hamilton Method." Tells plainly just how to succeed in growing to full perfection the finest High-Grade Sweet Peas,—such as are contained in this unequalled collection.

## BURPEE'S SEEDS GROW!

We will mail FREE to any address

## BURPEE'S Farm Annual For 1897.

The Leading American Seed Catalogue.

A handsome new book written at Fordhook Farm. Tells all about the BEST SEEDS That Grow. Hundreds of illustrations; grand new vegetables and beautiful rare flowers painted from Nature.

Send a postal card for it TO-DAY!

W. ATLEE BURPEE & CO.,  
Seed Growers,  
PHILADELPHIA.

## WEEBER & DON,

Seed Merchants and Growers,  
114 Chambers St., NEW YORK.

### Illustrated Catalogue

of Vegetable and Flower Seeds  
NOW READY.

EVERY GARDENER SHOULD HAVE ONE.  
Free on Application.

Mention American Gardening when you write.

### AUCTION SALES.

## William Elliott & Sons

10,000 VIOLETS given away. \$1 per 100 pays for packing and postage. Many have room in greenhouses at once. Young well-rooted plants, Lady Campbell. The earliest, freest bloomer, sweetest and healthiest of all double violets. C. E. Price, Smithtown Branch, N. Y.

WIXON PLUM TREES. Very extra stock, have no stunted maling sizes. Over forty varieties oriental plums now being tested. Can furnish many of fruiting age. The largest size are really the cheapest trees to plant. Our stock is clean, healthy, vigorous, with perfectly formed heads. Address Bridgeport Nursery, Conn.

COLLECTION J.—1 vine of the new red grape, "Alice," \$1.00; 1 vine each Worden, Brighton, Niagara and Diamond, 50 cts. Free by mail for \$1.00. Collection K.—One vine each Agawam, Brighton and Delaware (reds); Concord, Moore's Early and Worden (blacks); Diamond, Niagara and Pocklington (whites). Free by mail for 75 cts. Address M. H. Ridgeway, Wabash City, Ind.

GOLD-COIN VINELESS. I am the originator of this improved strain of the vineless Sweet Potato, and I will send free a full history of it and how it was brought to its present state of perfection, and how to grow them successfully, or for 10 cts. in stamps I will include a sample potato, and the stamps may be deducted from the first order. Will am T. Simpson, Box 74, Pine Bluff, Ark.

GLADIOLI, CANNAS, CLIVIAS, Souchelet and Lemoline's novelties first offered in America. Special tested selections at European prices. Extra mixtures: Ingleside Hybrids, Dr. Van Fleet's choice collection, Burbank's California Select, Mt. Vernon Hybrids, Groff's Hybridized Seed and Seedlings. Cannas, Italia, Austria, and best standards. New Hybrid Clivias. Canna Seed. H. H. Groff, Simcoe, Ontario, Canada.

BERMUDA GRASS is the greatest lawn grass in the world and it ought to succeed wherever winter wheat is grown, so easy to grow too. I supply the roots in bags or barrels very cheaply. March and April is the time to order. If you want anything in the way of seeds or plants grown in the South, write me for it and I will procure you the best at reasonable prices. Samuel A. Cook, Drawer N., Milledgeville, Georgia.

20 ACRES rich, level farm land, free from rocks and swamps, and especially adapted for truck, fruit, cotton and tobacco raising, for \$500, payable \$10 down and \$1 or more weekly. Convenient to great eastern markets, in thickly settled section of Virginia. Genial climate all year. Splendid water. Schools, churches, stores, mills and desirable neighbors. Deed free and title guaranteed. No malaria, mosquitoes, blizzards or floods. Taxes and freight rates low. For further information write to D. L. Risley, 211 S. 10th St., Philadelphia, Pa.

LARGEST STOCK of Strawberry, Raspberry, Blackberry, Gooseberry, Currant and Grape to select from in Michigan. Crescent, Wardell, Lovett, and Michel's Early, \$1.50 per 1000. Greenville, Haverland, Jessie, and Beder Wood, \$1.75 per 1000. Bimbach, Dayton, Enhance, Gandy, Parker Earle, Tibbrell, \$2.00 per 1000. Cuthbert, Hansel, and Turner, \$3.25; Palmer, \$4.00. Kittatiny, Early Harvest, and Wilson, \$4.00. Concord Grapes, \$12.00 and \$16.00 per 1000. True to name. No. 1 stock. Address Wm. C. Babcock, Bridgman, Mich.

### Appointment.

Mr. James McGary, for many years in the employ of R. G. Dun, Esq., at Narragansett Pier, has accepted the position of gardener with Mr. John N. Hazard, Peace Dale, R. I.

### Boston, Mass.

At the exhibition of the Massachusetts Horticultural Society on Feb. 27, James Comley contributed a beautiful basket of orchids, mostly *Coeloglyne cristata*, but interspersed with *Cattleya Mossiae* and *Cypripedium villosum*, and the whole fringed around with foliage of *Grevillea robusta*, he also brought a collection of roses, including *Gloire Lyonnaise*, *Safrano*, *Francis B. Hayes*, *Oakmont*, *Isabella Sprunt*, the *Bride*, *Reine Marie Henriette*, and a large bunch of very fine California violets. Mrs. E. M. Gill brought several varieties of *Pelargonium*, three *Narcissus* and two of *Antirrhinum*; also *Bougainvillea glabra* *Sanderiana*, *Corceopsis*, *Abutilons*, *Cyclamens*, *Tropaeolums*, *Amaryllis*, *Tulips*, *Carnations*, *Genista*, *Begonias*, etc. Mrs. P. D. Richards exhibited *Pinus palustris* from Pinehurst, N. C. Arthur F. Coolidge exhibited Tennisball lettuce, Round Globe radishes, beet greens and parsley; George D. Moore, radishes, and Hon. Aaron Low, spinach.

### Poughkeepsie, N. Y.

The programme of the Dutchess County Horticultural Society, just received, has the following topics for discussion: April 7: "Grape Growing Under Glass," by Mr. James Withers, of "American Gardening." May 5: "Rose Culture Under Glass," by Mr. James Blais, Staatsburgh. June (at Annandale Rose Show): "A Plea for Garden Roses," by Mr. Patrick O'Mara, of Messrs. Peter Henderson & Co. September: "Outside Fruits for the Family Table," by Mr. Thomas Harrison, Rhinecliff. Oct. 6: "My Experience with Greenhouse Grapes Grown Outside," by Mr. William Russell, Millbrook. Nov. 3: "Vegetables for the Family Table," by Mr. Herman Asher, Rhinebeck. Dec. 1: "Peaches and Nectarines Under Glass," by Mr. William Turner, Tarrytown. Jan. 5: "Helps and Hints for the Amateur," by Mr. Wallace G. Gomersall, Fishkill-on-Hudson.

The Dutchess County Horticultural Society met at Poughkeepsie, March 2. Three new members were elected and three nominated. The membership now stands at 105. It was resolved that the June meeting be held at Annandale, June 16, in conjunction with the Annandale Rose Show, June 16 and 17. At this meeting Mr. Patrick O'Mara of Peter Henderson & Co. will read a paper entitled "A Plea for Garden Roses." It was resolved to offer a \$25 premium, to be competed for at the Annandale Rose Show for the best collection of Roses, 26 varieties, 3 blooms of each. It was also decided that the September meeting be held at Millbrook, when it is expected an exhibition of Flowers and Vegetables and Fruits will be held, under the auspices of the Millbrook Horticultural Society. At this meeting a paper will be read by Mr. Thomas Harrison, on "Outside Fruits for the Family Table." It was decided to place a \$25 premium, in the form of a cup or cash, at the disposal of the Millbrook Horticultural Society.

A number of replies to questions were read at the meeting. Among them a reply from Mr. John N. May to the question, "What is the Best Formula for a Fertilizer for Roses Under Glass." From Mr. Robert Cameron of Cambridge Botanic Garden answers to the questions: (a) "What Are the Best Twenty Annuals for Cut Flower Purposes?" (b) "What Are the Best Twelve Annuals for an Amateur's Garden?" (see below), and from Mr. John R. Fotheringham, of F. R. Pierson & Co., to the question, "What Is the Best Collection of Hardy Perennials to Give a Succession of Bloom the Whole Year?"

The next meeting will be held Wednesday, April 7, when Mr. James Withers of "American Gardening," will talk on "Commercial Grape Growing Under Glass."

### The Best Annuals.

What are the best twenty annuals for cut flower purposes?

*Antirrhinum majus* and its varieties. If the seeds are sown early in March in pots or boxes in the greenhouse and grown along until May then planted out in the garden, in good rich soil, and in a sunny position, plants will bloom early and continue flowering until late in the season. The plants grow about two feet in height and are of various colors. The self-colored kinds are very good.

China Asters are indispensable for cutting, but they are so well known that they need no comment here.

The *Calendulas* have good yellow flowers and if they are not needed early in the season

they can be sown in the garden. Orange King, Meteor and Prince of Orange are desirable kinds to grow.

*Iberis coronaria* grows from one foot to one and a half in height, and has good sized spikes of white flowers. It grows freely in a rich, loose soil and requires room to develop into strong plants. It can be sown out of doors early in the season.

The annual *Chrysanthemum* are excellent for cutting; if required early they can be sown in the greenhouse in April and when the weather is favorable can be planted out of doors. They do well also sown in the garden out of doors in May.

The annual *Coreopsis* are also good and are easily raised by sowing them in the open ground early in the season. Some of the best species are *Drummondii*, *tinctoria*, and *Atkinsiana*.

*Dianthus sinensis* and its varieties are very useful and last well.

*Gaillardia picta*, variety *Lorenziana*, has brownish, crimson, purple flowers and are useful for cutting.

*Lathyrus odoratus*, the sweet pea, is without doubt one of the most useful annuals. *Mignonette* also is an essential plant; there are many desirable varieties. *Phlox Drummondii* and all its varieties are well adapted for cutting purposes. *Scabiosa atropurpurea* has flowers of various colors and they last well when cut.

The garden stocks have good lasting qualities and they well deserve a place in this list. The double *Zinnias* are showy and the flowers last well. *Centauria Cyanus* and its varieties are useful, although their flowers are not large. *Cosmos hybrida*, especially the white form, is good where it can be had in flower before the frost comes. *Hollanthus cucurbitifolius* is very good and has clear yellow flowers. The annual *Larkspurs* have showy spikes of flowers and they last for some time. The *Tropaeolums* are always useful and last well. The *Hellebrys*, "everlastings," are very useful for winter bouquets.

The best twelve annuals for an amateur garden are: *Tropaeolums*, Sweet Peas, *Clarkia elegans* and *pulchella*, *Phlox Drummondii*, China Asters, *Coreopsis Drummondii* and *tinctoria*, *Convolvulus tricolor*, *Dianthus sinensis* and varieties, French and African Marigolds, Shirley Poppies, *Petunias*, *Mignonette*.

(Signed.)

ROBERT CAMERON.

#### New York.

The carnation novelty exhibition at the American Institute, New York, on Tuesday proved a marked success. More than twenty exhibitors from various parts contributed some superb samples of cultivation. Carnations predominated, and of these fifteen kinds were new, many being exhibited for the first time. Those presented to the judges for certificate as a novelty were submitted to the crucial test of the American Carnation Society's rules, and one only passed muster.

**Carnations.**—The certificated variety was seedling No. 3, from Dailledouze Bros., Flatbush, L. I. This is perhaps one of the highest ideal carnations yet introduced. The grass is deep green, slightly curling, stems rigid and lengthy, flowers fairly large, with perfect form and outline; color a delicate blush on white ground, the color in the center being a deeper salmon, fragrance very marked (100 points).

This same firm presented Bay Ridge and seedling No. 8; Also grand vases of Helen Keller and Lizzie McGowan.

B. Leavitt, Stamford, Conn., staged Mrs. A. T. Plummer a very fine red seedling. This received 79 points. Mr. Leavitt also put up some Spanish varieties. The petals of these are very deeply fringed.

C. Besold, Mineola, staged a large vase of Mrs. Joost, and Nero. These scored 79 and 55 points respectively.

Victor, a sport from Daybreak, presented by Hugh Graham, Philadelphia, scored 76 points. Daylight, exhibited by Joseph Towell, Paterson, N. J., was, in the opinion of the judges, identical with Victor, and received the same number of points. Mayor Pingree, after its long journey from Detroit, Mich., appeared in excellent condition and does the exhibitors, Breitmeyer & Sons, much credit. Gaiety, Saginaw and Amazon were exhibited by Albert Hake, Manchester, Pa. J. N. May, Summit, N. J., had Maud Dean and Lily Dean. Both these had been certified by the Institute at a previous meeting. This exhibitor also put up a vase of President Carnot rose. A. Herrington, Madison, N. J., made a grand showing with carnations—Storm King, Daybreak, Madam Duhamel, Albertini, Princess May (English) and Church Warden (English). He also contributed a spray of mignonette with nine spikes of bloom, all of great size and vigor. Also a vase of

*Narcissus* Horsfieldi. Harrison Quimby, Parsippany, N. J., put up a vase of Minnie Cook of great merit (a cultural certificate was awarded). C. H. Allen, Floral Park, made a grand showing of W. Scott.

**Violets.**—Ferd. Boulton, Sea Cliff, N. Y., received a certificate for Princess of Wales, a most exquisite lot of violets, with stems ten inches long and blooms nearly two inches in diameter; bunches of Luxonne and California came from the same exhibitor. George Saltford, Rhinebeck, N. Y., exhibited the new Pink Violet, Mrs. J. J. Astor, which has been previously described in these columns.

F. G. Mense, Glen Cove, L. I., put up two large bunches of Marie Louise—one lot grown in cold frames and the other indoors. Both were superb.

**Miscellaneous.**—John Lewis Childs, Floral Park, L. I., showed *Antirrhinum majus albus* (very fine) and *Amaryllis sulcata platypetala*. John White, Elizabeth, N. J., exhibited his variegated leaved Canna John White, for which a certificate of merit was awarded. From plants in a number of small pots it was proven that the variety comes true from seed. Julius Roehrs, Carlton Hill, N. J., made a nice exhibit of Tulips, Hyacinths, and *Narcissus Golden Spur*, in pans. Messrs. Siebrecht & Son had Palms in variety.

There was a large attendance both of the trade and general public at the afternoon meeting, at which C. L. Allen, C. H. Allen, Henry Bird, J. White, A. Herrington, J. Withers and J. F. Johnson spoke.

#### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

**SITUATION** wanted by married man, age 27, no children, to take charge of gentleman's place, 10 years' experience in greenhouses, etc., 2 years in last place, can furnish best of references, Scotch. Address 1121 Hill Crest, N. Broadway, Yonkers, N. Y.

**BY** women, each with an infant or young child, situations in the country (general housework, plain cooking, etc.) in New York and adjacent States. Small wages expected. Railroad fare paid by Association. Apply State Charities Aid Association, 105 East Twenty-second St., New York City.

**GARDENER**, Scotch, married, three children, ages respectively 5, 13, 15; desired position in first-class private place; thoroughly conversant with gardening and greenhouse work in all its branches, good all round grower, sober, honest, industrious, can give exceptional references. W. F., P. O. Box 2541, N. Y. City.

**HEAD GARDENERS.**—We have constantly on hand Gardeners of all kinds, single and married—men competent to take charge of graperies, greenhouses, vegetable gardens, lawns, roads, and the usual work pertaining to their profession. Correspondence solicited. Peter Henderson & Co., 35 & 37 Cortlandt St., New York.

**GARDENERS**, farmers, etc.—Employers desiring the services of reliable men to fill positions as above are invited to correspond with us. On our Register are the names of excellent men whom we have known for a long time. No fee charged to any one.—R. & J. Farquhar & Co., Seedsmen, 16 and 19 South Market St., Boston, Mass.

**SITUATION** wanted, by a gardener and grower; 23 years' experience; conversant in all branches of business, especially forcing grapes, roses, miscellaneous cut flowers, palms, orchids, mushrooms and ornamental bedding. Would like a position where neatness and accuracy are required. Can furnish proof. H. N. Birth, 14 Prospect St., East Orange, N. J.

**A LADY** wishes to recommend her thoroughly experienced head gardener, as an able, skillful, industrious man of good character, especially good with flowers, and all greenhouse work, married, with one little girl. I want to get him work by the first week in April, near the Hudson or the coast if possible. Address Mrs. W. L. P., 28 Gardener Park, Rochester, N. Y.

**GARDENER** and florist, Swiss, 48, married, no family, thoroughly understands his business in all kinds of greenhouse plants, palms, crotons, dracaenas, ferns, chrysanthemums, water plants, roses, carnations, violets, graperies, fruits and first-class vegetables under glass and out-of-doors, ornamental shrubs, lawns, and roads; life experience, to take charge of a gentleman's place, best references. Address P. Haessli, Hoosick, N. Y.

**SITUATION** wanted.—First-class Gardener with diploma from both sides of the Atlantic, will guarantee financial success in producing choicest roses, also mushrooms under glass, in same building, and heat, thereby saving expense in labor, space and fuel; forcing vegetables under glass and European grapes specialties; thorough artist at table decorations; good landscape gardener; best city references. Wm. Thompson, 741 First Ave., N. Y. City.

#### WANTED.

(Rates, etc., same as in "For Sale" column.)

**WANTED.**—A married man to manage and work a place in fruit, flowers and vegetables, one mile from city, either on a salary or to take an interest. To a first-class sober man this is a splendid opportunity. Address Evergreen, 272 Second St., Memphis, Tenn.

## DON'T WASTE ANY MORE

of your God-given time and strength in growing any kind of a farm or garden crop without using one of the Z. Breed Weeders. They will save three-fourths to nine-tenths of your time, and it is a pleasure to use one. Thousands of farmers and gardeners all over the U. S. will testify to this. Will work corn, hills and all, until it is 18 inches high, potatoes 8 to 10, and all other crops in proportion. Will work corn, potatoes, peas, beans, cucumbers, squashes, melons, cabbages, tomatoes, celery, asparagus, strawberries, beets, carrots, onions, etc., to your perfect satisfaction, and give better crops than by any other method. This may seem impossible to you but it is true nevertheless.

"I used your No. 4, or Onion Weeder, the past year. When I tried it first my very conservative uncle, an old onion grower, tried to find the onions that were pulled out. He said it did not pull up as many as the boys would. I ran over the acre lot every few days and the boys began to think they would not have any more work from me. The surface of the ground on my carrot field baked hard and I do not think they would have seen the light of day had I not used the weeder to break up the crust. I would not part with it at any price if I could not get another." **ORLANDO F. NEWHALL, Peabody, Mass.**

There are many reasons why you cannot afford to do without a weeder this year. Send today for circulars giving full information. Nine sizes and styles of walking, riding and hand weeders. One of these will hit your case surely.

## Money Methods in the Market Garden.—V.

### Money in the Strawberry Field.

The purpose of this article is not to describe methods by which the largest berries can be grown to sell at fancy prices, nor how to produce fine exhibition berries, but to describe how to get the most bushels per acre, and berries of good size and quality for the general market. For twenty years I have been growing strawberries, and in that time have tried many experiments, and the plan now settled upon in growing them for market has not failed to give me good crops, and has made some money for me.

In starting a new bed begin very early in the spring, and, in order to get the ground in condition to work very early, it is plowed in the fall, stable manures being drawn on in the winter and the ground covered by two or three inches in depth, or about 30 tons per acre. In this place I can buy plant food more cheaply in manure than in chemical fertilizers. When the ground is sufficiently dry in the spring harrowing is commenced, first using a harrow made something like the "Cutaway" harrow, which is about equal to plowing the ground. This is followed by a fine-toothed smoothing harrow and finished with a light plank drag. With a small plow open furrows four or five inches deep and about three feet apart.

For transplanting I use plants from the new bed which were set the year before and have not yet fruited, a few rows being allowed to run together, completely covering the ground. With a spading fork dig up the plants in sods and load them on a low wagon, taking up a space about sixteen inches wide between the rows. Draw the plants along the furrows which have been made for them, and unload them in piles one or two rods apart. In transplanting I like to have three men—one to break the plants apart, leaving some soil on the roots, and drop them about sixteen inches apart; another man following puts them in place and draws a little soil around them with his hands; the other man with a hoe draws more soil around the plants and presses them down with his foot. This is the easiest and most satisfactory way I have found to set strawberry plants in large numbers. The plants are set so early in the spring that the leaves have only just started. With so small leaves and with so much moisture in the ground nearly every plant will live.

As some soil is left on the roots in transplanting, their growth is but little hindered by the transplanting and they get a very early start. A few rows are set with the plants very close together, so as to have plants to fill in if any should fail to live or are destroyed by the white grubs.

Cultivation is commenced soon after transplanting, and the horse cultivator is followed by a wheel hoe, which leaves but little weeding to be done by hand. If I am not satisfied with the growth of the plants nitrate of soda is given.

All the fruit stems and runners are kept cut until about the first of July, so that cultivation can be carried on close to the plants; at that date I let one runner on each plant set in the rows, and a little later more runners are allowed to grow out around the plants, being so trained as to set plants six to eight inches apart. When the row is filled out in this way to about twenty inches wide, I try to

"I am so well pleased with my No. 4 Weeder that I thought I would write and tell you that I have tended twenty-three acres of corn, one and a half acres of beans besides sweet potatoes, garden truck, blackberries, raspberries, not using any other tool of any kind. I made a perfect success of it. Have done it all with one horse, going over the entire lot in less than two days."

**DAVID HANSBARGER, Ansonia, O.**

keep all other runners cut. These small spaces between the plants may be worked with a narrow hoe, and the soil should be stirred very frequently to keep it loose and to stop the weeds from growing. The bed is mulched with manure when the ground freezes and the next year the cultivation and weeding are kept up until the berries are nearly grown.

For the general market the best strawberry I have found is the Warfield. It is very prolific, a good shipper and a very handsome berry when well grown; it does well on all kinds of soil, and with me it is a money maker. I have a trade at nearby summer resorts for some very large berries at a fancy price, for which purpose I grow Bubach and Marshall.

The Warfield and Parker Earle will set so many berries that they will not all grow to a good size with ordinary culture, but on very rich ground and with irrigation I get large crops, generally over 200 bushels to the acre, and portions of my field have yielded me at the rate of 500 bushels per acre.

W. H. JENKINS.

Delaware County, N. Y.

### The Apiary.

In a few weeks' time our bees will want pollen; they are now breeding rapidly and consume a considerable quantity of food; they also want water very badly. During warm days, when they are flying, set out a flat dish with water and throw a lot of little pine sticks on top, so that the bees can sit on them and sip the water. This means a saving of the lives of many bees, for they will go where they can get water, and often get chilled, and can never return to the hive.

Fine rye flour makes the best substitute for pollen. Place some in a shallow dish and see how eagerly the bees go for it. The water and rye meal should be close to the apiary in a sheltered nook.

See that there is plenty of honey, as a great deal is required to build up properly in the spring. If the colony is short of feed, it will economize and not raise enough brood, with the result that you will have a weak colony when you want a rousing strong one to gather the honey. It does not pay to underfeed our bees any more than it does to practise the same falsity with our vegetable plants or berries. The result is ultimately the same—no profit or entire starvation.

The best way to feed colonies that need food now is by taking pulverized sugar and working honey into it until it is a stiff dough; lay a cake of this right on top of the brood nest, cover snugly; the bees will do the rest. Only see you keep enough there for them.

Be very careful in examining the bees that you do not chill them. Under no circumstances tear the brood nest apart; the honey is at the sides and on top, and if you cannot find much there, feed at once. I have had cases where there was too much honey, but that does not occur often, but if a hive be found that seems to have every frame filled with honey and a small cluster of bees, it will be well to take a frame out close to the cluster, not out of the cluster, and insert it into a hive that wants food, putting an empty comb in its place to make room for the bees to extend the brood nest.

Some colonies are slow at building up, even if they have plenty of honey in the spring, and right here I learned that even some bees are like my neighbor, always afraid there will not be enough, and too stingy to use what there is already. How do I know? Well, whenever I cut off the cappings from part of a comb, every few days, they will use the honey much faster and breed up much better. You see, they think I put so much new honey in and that they do not take of their own.

## WHOLESALE MARKET REPORT

## New York.

The Patriarchs' ball in this city, March 1, and the Inaugural ball at Washington, March 4, helped materially to sustain the flower market for the whole week, otherwise there would have been a collapse. Roses and carnations are off crop. Bulbous stock also lightened up considerably. Among the new stock now coming in is Hybrid roses, including Mabel Morrison, Merville de Lyon, Baroness de Rothschild, Ulrich Brunner, General Jacqueminot and Mrs. John Laing. Sweet peas are also plentiful; Gladiolus Shakespeare is also on the market in limited quantity.

The vegetable market apparently is clearing out better than any other at this time, and business generally in this line is very fair. But with fruit of any kind things are different.

Strawberries are becoming plentiful and demand poor; prices uncertain.

Apples show no improvement.

Cucumbers are moving freely at \$1.50@1.75 per dozen for No. 1, with No. 2 at \$1.00.

Mushrooms are cleaning up well. Good stock is realizing 40@50c. per lb. Stock a little off, 30@35c. per lb.

Hothouse tomatoes, if of good color, sell readily at 30c. per lb.

Hothouse lettuce is also meeting with fair trade. A limited quantity of very fancy makes 75c. per doz.; general figures rule from 25c. to 60c. per doz.

New potatoes (Bermuda Early Rose and Garnet) sell at \$6 to \$7 per barrel for No. 1. Havana stock \$5.

Celery sells well when prime.

Radishes are not over-plentiful, but when good make \$2.00 to \$3.00 per 100 bunches.

Asparagus is getting plentiful and makes for No. 1 \$1.00 to \$1.25 per bunch.

Rhubarb \$3.00 to \$5.00 per 100 bunches. 4@5 sticks in a bunch.

Onions still remain good property and prices show a tendency to stiffen rather than otherwise.

Apples.

## Philadelphia.

The market has presented a much better appearance this past week; all kinds of vegetables have been in better supply, but even for new things it is difficult to obtain any high prices.

Strawberries, Fla., are arriving in much larger quantities, but are mostly of second grade; first quality sell at 30 to 35c. per qt.; the bulk go at 20 to 25c.

Hothouse tomatoes are more plentiful and bring 25c. to 30c. per lb.

Mushrooms are selling very well, but good prices cannot be obtained, the best quality sells at 25c. to 30c. per lb.

Cucumbers are very plentiful, and do not sell very well; prices have fallen to \$1.50 and \$2.00 per doz.

Apples are still held firm, but many sales

were made below the quoted figures. Fruit is now changing rapidly. Apples keep a very little time after being unpacked.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\*. We cannot undertake to reply by mail.

## CALADIUMS.

(Will you please inform me how to keep Caladiums all winter, from the time I take them up in the fall? Many of mine have rotted.—MRS. F. L. B.)

—If it be Caladium esculentum that is meant, there should be no difficulty in keeping the root of that during the winter months. A dry warm cellar or under a greenhouse bench usually serves. Rotting must be the results of too cold a temperature and damp or injury in some way. The roots need but little, if any, attention, to start them. If forward large plants are needed roots may be put in a warm sunny position with just a little soil around them, and they will start growth at once. But without this trouble good results can be obtained by planting them outdoors when all danger of frost is over. When the weather warms up they will then make rapid growth.

## PRUNING FRUIT TREES.

(Last fall I set out trees of following varieties: Duchess of Oldenburg and Jonathan apples, Bartlett and Kieffer pears, Early Richmond cherries and Abundance plums. All bought through local representatives of two different nurseries. One of said agents tells me I should this spring cut all back, leaving but two or three shoots, and these shoots should be shortened down to five or six dormant buds. The other agent says the trees should not be cut back or trimmed further than removing of shoots that start out from

# St. Vitus Vanquished.

## What Cured Little Stanley Nichol of Chorea.

From the Republican-Journal, Ogdensburg, N. Y.

A letter was lately received at the office of the *Republican-Journal* from Hammond to the effect that the cure of an extraordinary severe case of St. Vitus' dance had been effected on the person of little Stanley Nichol, the eight-year-old son of Mrs. Charles Nichol, of that village.

A reporter was accordingly dispatched in that direction, who, after some inquiry, found Mrs. Nichol's residence about a mile outside the village. Mrs. Nichol said:

"A little over a year ago my boy, Stanley Nichol, who is now only eight years old, alarmed me one day by being taken with a strange gurgling in his throat. After the first the attacks became quite frequent. Stanley did not complain of any pain, but said he could not help making the noise. At that time there was a New York doctor stopping in the village who was a specialist on throat and nasal diseases. I took my son to him, and after a careful examination, he said that there was nothing the matter with the boy's throat. The gurgling, in his opinion, was caused by a nervous contraction of the muscles of the throat. He asked who our family physician was, and said that he would consult with him before he prescribed.

"Stanley rapidly grew worse. He was always a sickly boy. One day I noticed that he was jerking his arm up in a very peculiar manner. A few days later he seemed to lose control of his legs; first one, and then the other would be pulled up, and then straightened out again. He was a perfect bundle of nerves, and was rapidly losing all control of himself. When eating at the table or drinking, his arm would often twitch so as to spill what he was drinking. One day he scared me terribly by throwing back his head and rolling his eyes up so that only the white parts showed. I took him to our family physician, who prepared some medicine

for him. He took it, and commenced to improve. The dose, however, had to be increased, and Stanley rebelled against taking it. It was very disagreeable medicine, and I don't blame the boy for not wishing to take it.

"Our physician went to New York City on business, and while he was away the medicine became exhausted, and we could get no more. Stanley was still very bad. About that time I read about a little girl who had been cured of St. Vitus' dance by taking Dr. Williams' Pink Pills. I thought I would try them and procured a box. I followed the directions that came with the pills, and gave only half a pill at a dose. I did not see much improvement, and increased the dose to a whole pill. The effect was noticed in a day. Stanley immediately commenced to get better and did not object to taking the pills, as he had the other medicine. He took seven boxes of the pills, and to-day appears to be perfectly well. He discontinued taking them some time ago. He weighs nearly fifteen pounds more than he did and is strong and hearty. A year ago we took him out of school, but he is so much better now that he is going to begin again this fall.

Dr. Williams' Pink Pills for Pale People contain, in a condensed form, all the elements necessary to give new life and richness to the blood and restore shattered nerves. They are also a specific for troubles peculiar to females, such as suppressions, irregularities, and all forms of weakness. They build up the blood and restore the glow of health to pale and sorrow cheeks. In men they effect a radical cure in all cases arising from mental worry, over-work, or excesses of whatever nature. Pink Pills are sold in boxes (never in loose bulk), at 50 cents a box, or six boxes for \$2.50, and may be had of all druggists, or direct by mail from Dr. Williams' Medicine Company, Schenectady, N. Y.

Or all three collections for 25 cents. Our CATALOGUE FREE with every order. THE PAGE SEED CO. GREENE, Chenango County, NEW YORK.

Mention American Gardening when you write.

trunk of tree too near the ground. Will you kindly say how above trees should be treated? I also have currant and gooseberry bushes set out spring of 1896; made poor growth during past summer. Should I cut them back?—C. W. J.)

—It is impossible to advise you from the foregoing scant details. Are the trees standards? What growth have they made? Again, both agents may be right, as the necessary treatment will be according to the conditions of the trees. If they had been pruned back, and now have short spurs no further cutting is now wanted. You will do well to read the instructions given in the "Fruit Garden" in our issue of Feb. 6. It would be better to mulch and encourage the currants and gooseberries rather than knife them; prune lightly.

**PLUMS FOR CONNECTICUT.**

(Name three plums suitable for Connecticut and Wells River Valley. How about the Hale plum? Would Lucretia dewberry winter here?—W. M. S., CONN.)

—Satsuma and Wixon plums were well spoken of at the Pomological meeting at Hartford recently, and the Hale plum was especially well spoken of. Some growers went so far as to say it was the best in existence. You would do well to read up carefully our report upon that meeting (page 139); also notes on Japan plums, on page 143. On page 139 are also remarks on Lucretia dewberry.

**WHEN TO RE-POT.**

(Will you please tell me how to know when flowers require a larger pot than the one they are growing in?—A. M. B.)

—Plants in the spring and early summer need repotting when the existing ball of earth is filled with roots. To know this, turn the pot upside down, give a sharp tap on the edge, holding the plant firm in the hand, and the pot can be removed, the roots examined, and the ball returned to the pot without injury.

**GERANIUMS FAILING; BOOK ON HOUSE PLANTS.**

(What is the cause of the bottom leaves of geraniums drying up and falling off when the upper part seems to look green and thrifty? What is the best book on the culture of house plants and where can it be had? I would like one written in a condensed form, as I haven't much time to read.—A. N. BYRNES.)

—Probably the geraniums have been allowed to get dry or else they are lacking light and air. The best book on the subject is "Window and Parlor Gardening," by Jonsson Rose; price \$1.25. Our publishers can supply it.

**ORANGE LEAVES INJURED.**

(To F. A. W., N. J.): The leaves of Otahite orange which you send have evidently suffered some mechanical injury. There is no fungus or specific disease. A chill either by draught or by water at a very low temperature when the tissues were very soft, or bad root conditions, would each or all be sufficient cause. The plant will not be permanently injured.

**SCALE INSECTS.**

(Will you give me the name of this scale which I inclose. It seems to be at home, as far as I have noticed, only on the Japanese Magnolia obovata. In early fall, under pressure, it gives forth a thick purplish secretion. Along with these on the same stems are large numbers of small black scales; are they the undeveloped form? Please state the best remedy and also best time to apply.—A. O. B., Sing Sing, N. Y.)

—The scales were so badly crushed and mutilated that specific determination is not possible. If Mr. Brown will kindly send several small twigs with the scales in place perhaps we can tell him what the species is. There is little or no doubt that it belongs to the genus Lecanium. The whale oil soap wash or kerosene emulsion wash would be effective in destroying it. One and a half to two pounds of soap in a gallon of water would suffice. The emulsion should be diluted with about ten parts of water.—W. G. Johnson.

## OUR PREMIUMS ARE OFFERED

doing we expect them to obtain the new subscriber and retain the premium. If the subscriber they procure wants a premium (and he doubtless will), he, in turn, should interest himself in the same way. New names sent in direct are, of course, also entitled to our premium offers. Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

### THE THREE BEST CANNAS KNOWN.

# Austria, Italia and Mrs. Fairman Rogers

Your choice of one of the above three Cannas sent, postpaid, for one new subscription. The set of three for two new subscriptions. Grown in N.Y.

With the introduction several years ago of the famed Madam Crozy type of Canna began the era of popularity for this class of plants, until now it has become the most popular of all bedding plants and the possibilities for further development of this species is yet far from being exhausted. Its great claim for popular favor is the extreme ease with which it can be grown, thus making it at once everybody's plant; also in its ready adaptability to our climate.

#### MRS. FAIRMAN ROGERS.

One of the finest American Cannas, was originated at Newport, R. I. This plant often produces fine branched flower heads, and while in texture, color and markings the individual flowers excel the standard of Mme. Crozy, their superiority is again evidenced in the fact that each branch presents a rounded head which is one dense mass of bloom. The flowers will measure 4 inches across each way, and the segments (without the claw) measure  $2\frac{1}{2} \times 1\frac{1}{2}$  inches. The color is a grand scarlet, bordered with a narrow band of gold. The compactness of the flower head, rich color, and the well-flowered spike, complete its great value as a bedder. It grows to a height of three feet under liberal treatment.

#### ITALIA and AUSTRIA.]

Among the many sterling novelties which have been added to the already large list of Cannas during this last three or more years, there are none that form so distinct a break from existing forms, and which have at the same time proved such valuable acquisitions to our list as the above.

In habit, color, and style of growth and foliage, they resemble a good deal the species *Canna flaccida*, which is said to be one of the parents; the texture of the bloom is also very much the same as in that species, and it is that feature which is decidedly the weakest of either novelty. This lack of texture causes the floral segments of each to bleach out in the early season if grown out of doors in a position exposed to the strong sunshine at that period.

This, however, is compensated for by the fact that each morning while the spike lasts (and it usually carries seven to nine blooms), one is treated to a new, clean, bright bloom of the most gorgeous and exquisite coloring imaginable. Austria is of the clearest canary-yellow, slightly speckled with a few dots of red in the throat. Italia as flowers of similarly hued yellow, dotted and emblazoned with a clear scarlet which adds wonderfully to the effect of its gorgeous coloring.

The spikes and flowers act somewhat differently from other Cannas in their habit and style of expansion, behaving in reality like the Gladiolus, and being arranged on one side; there is one expanded bloom and two partially open, and when the older bloom is ready, it drops clean away, leaving no trace of dead or wilted flowers; the reverse of which is a source of annoyance with too many of our good Cannas.

The largest individual bloom of Austria with us measured five and one quarter inches across, and the average on all the flowers we should judge was about four and three quarter inches. One plant put out in June from a five inch pot into only eight inches of very poor soil, without any special treatment, produced eleven spikes of bloom, 33 growths, and attained a height of 42 inches. This wonderful development on our poor soil, when compared with others grown on equally poor and still more sandy soil, goes far to prove that these new types do not need a very rich soil.

Austria and Italia were also found to stand wind storms better than the ordinary kinds.

As a cut flower they are unique and good keepers. They have been aptly named the "Orchid-flowered" Cannas.

Plants ready for shipment on and after May 15th, but to avoid delay this premium should be earned now, as thousands will want it.

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

**Hustle.**  
**Hotbeds** now in order.  
**Sow radishes** under glass.  
**Plenty of grit** for the poultry.  
**Smith's Improved.**—A good gooseberry.  
**Gardener's reserve force.**—The compost heap.  
**Grape cuttings.**—Take them on mild days now, if not cut last fall.  
**Nurserymen** should be among the most honest and square dealing of men.  
**Warden Grapes** sold readily when the others were a drug on the market.  
**Cherries.**—Early Richmond, Ostheim and large Montmorency are largely planted.

**Loudon Market Currant.**—Order a dozen plants of some reliable nurseryman.

**True economy** and penuriousness are widely different in gardening operations.

**Mixing Manure.**—Any method of thoroughly incorporating manure with the soil soon after applied is a good one.

**The Idaho pear,** which has received so much praise, is proving disappointing to one gentleman who has fruited it this year.

**Whatever else happens** we will not let the crust form on surface of soil where we set our fruit plants. There is too much loss in it.

**Cone setting** cannot be rapidly done without a machine for making the cones. Making cones with hand and hoe is too slow a process to be practicable.

**Glen St. Mary Strawberry.**—Who has tried it? Great claims are made for it. I

should like to hear reports from some of the readers of A. G. who have fruited it this year.

**How many readers** of A. G. have tried grafting the different varieties of cactus for the window garden? It is easily done, and affords much pleasure to the operator who owns the plants and has the time.

**We will try the "cone" setting** of heavy-rooted raspberry tips as an experiment. We will have to set the cone over two inches deeper than for strawberry plants. Will report result as compared with other methods.

**Free Seeds.**—Congressman: "Hello! Farmer! I send you by mail a few packets of seeds. You'll find my name on the package." (Congressman's soliloquy): "I've fixed that farmer's vote all right. I'm glad I voted for the appropriation of \$150,000 for free seeds."  
CHARLES NASH.

## Offer No. 41.

## GREENVILLE APPLE.

(Downing's Winter Maiden Blush).

For one new subscription we will send by express, receiver to pay charges,

Four 3-Year-Old Plants.

Read the description: This fine apple was produced from seed of the Fall Maiden Blush by Jason Downing, in Darke County, O., in the Spring of 1774. It made a vigorous growth, and at the age of 7 years it bore some excellent fruit, from which time it has produced fruit annually. The originator states that in 1888, at the age of 14 years from seed, it yielded 15 bushels of picked apples. Grower has been noticing the behavior of this apple for the past 10 years, growing it both in nursery and orchard, and from the weight of testimony in its favor, has decided to grow it in quantities to supply the increased demand. Description: Fruit large, irregular, sometimes flattened, and at other times slightly elongated, inclining to conic; generally angular, skin light waxen yellow, with a bright red cheek in the sun; stock short, usually projecting half as high as cavity, though in a few specimens it projects to its surface and beyond, inserted in a deep cavity, often surrounded with russet; calyx small, basin of moderate depth, flesh yellowish, crisp, tender, juicy, with a very pleasant, mild, sub-acid flavor. It has a fragrant odor; quality very good. Season, December to April. Tree a good grower and bearer.

## Offer No. 53.

## HARDY EVERGREENS.

Your choice of any one of the below offers of Hardy Evergreens for one NEW subscription. This is a great big offer for the money, and invaluable to any one wishing to set out a young plantation. Plants from Illinois.

- A-50 Scotch Pine, 6 inches.
- B-50 White Pine, 4 inches.
- C-50 Norway Spruce, 3 to 4 inches.
- D-50 American Arbor Vitae, 4 inches.
- E-25 Red Cedar, 4 inches.
- F-25 Hemlock Spruce, 4 inches.
- G-15 Blue Spruce, 4 inches.
- H-25 Douglas Spruce, 4 inches.
- J-15 Picea Concolor, 4 inches.

## Offer No. 58.

## CHRYSANTHEMUMS

This collection comprises a very fine assortment of eleven standard large flowering varieties, from 2 1/2-inch pots, good plants, and will be sent, postpaid, for one new subscription; plants grown in Maryland. Ready for delivery on and after April 15. These plants will do well outdoors in mild climate, whilst in more exposed sections to bring them to full maturity in the fall they should have partial shelter.

- Mdme. F. Bergmann.—The earliest of all large varieties; color white, of great excellence.
- Ivory.—A popular favorite; very dwarf and free flowering.
- Miss Minnie Wanamaker.—Pure white Japanese; one of the standard varieties.
- Golden Wedding.—The most exquisite yellow Japanese extant.
- Eugene Dailedouze.—Monster flowers; yellow Japanese.
- W. H. Lincoln.—The champion late flowering yellow; a grand variety.
- Col. W. B. Smith.—Japanese incurved bronze.
- Mrs. J. G. Whilldin.—Earliest of the Japanese yellows. In flower same time as Mdme. F. Bergmann, Oct. 4 to 7.
- V. H. Hallock.—Color rose pearl; Japanese.
- Maud Dean.—The most charming pink Japanese ever introduced; a good market variety.
- Cullingfordii.—A reflexed variety of good reputation; color deepest crimson.

## Offer No. 61.

## Offer No. 46.

## THE CELEBRATED

## GREEN MOUNTAIN GRAPE

One 2 or 3 year vine and one 1 year vine; two vines in all. Sent, postpaid, for one new subscription.

The Celebrated Green Mountain Grape is fast coming to the front and is bound to stay. It is acknowledged to be the earliest good grape on the market. It is the most delicate and delicious grape grown out of doors. It is a strong-growing, healthy vine, an enormous and early bearer, with well shouldered and handsome bunches.

No one grape possesses so many merits as the Green Mountain. The firm making this offer are headquarters for this vine and have over an acre out as a vineyard.

## Offer No. 51.

Sent, Postpaid, for only one NEW Subscription at \$1.

## TEN FINE

## CHRYSANTHEMUMS

NEWEST, EARLIEST, BEST.

In Splendid Assortment of Varieties,

Forms, Substance and Color.

- Mrs. Higginbotham. Best of all Ostrich Plumes.
- Gloriana. The pretty twisted petalled yellow.
- Marie Louise. A grand white.
- Pitcher and Manda. A variety of two colors.
- Kate Brown. Earliest and best for the garden.
- Fres. Smith. A robust pink.
- Silver Cloud. Pale salmon.
- G. W. Childs. Finest of the reds.
- Major Bonaffon. The best yellow.
- Mrs. Henry Robinson. The queen of all the whites.

Amongst all the wealth of Flora's bountiful store, and the wonderful offers by the various growers who have contributed to our rich and varied premium list, there will be found none more enticing nor more valuable than the above. Requiring but a minimum of care in warm localities and slight protection to mature in more severe climate, and rewarding the cultivator with a wealth of bloom at a time of the year when the other glories of the garden are fast disappearing, what flower lover would ignore the claim of the Chrysanthemum? And where, we ask, will you find a duplicate of this wonderful offer? This collection comprises several different types, incurved, reflexed, early, late, ostrich plume, variegated, as well as a representation of all colors.

**OUR PREMIUMS ARE OFFERED** with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will) he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers. Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

## LORD PENZANCE'S NEW HYBRID SWEET BRIARS.

Quite a New Feature in Roses.

The foliage of every one of them is as sweetly scented as the old-fashioned Sweet Briar that grew in our grandmothers' gardens.

The Sweet Briar or Eglantine, is acknowledged by all to possess one of the sweetest perfumes that nature has provided and its delicious scent is the object for which it is usually cultivated. These new varieties, now for the first time placed in commerce, are vast improvements upon the old sorts. They are hybrids (obtained by the Right Hon. Lord Penzance) between the common Sweet Briar and various old-fashioned garden Roses and are possessed of many advantages.

The flowers are borne in wondrous profusion, and vary in color from white, through several shades of pink, to very dark red or crimson.

The plants are perfectly hardy even in very bleak and exposed positions.

For vigor of growth there is scarcely anything in the rose world to equal them. Plants three years old have now many shoots on them that rise to the height of twelve feet. These, with a slightly outward bend, and clothed with flowers of exquisite tints, produce a gorgeous effect.

The buds are the most graceful, sweet and delicate objects imaginable.

The flowers are single or semi-double, and this adds lightness and elegance to their beauty.

After the flowers are over, they are followed by bright scarlet seed pods or "hips" in great numbers, which, nestling among the deep green, scented foliage, make the plant delightfully ornamental till quite late in the autumn.

No garden will be esteemed complete which does not possess a group of Hybrid Sweet Briars. They are so sweetly scented, so beautiful in color, so hardy and free from disease and the attacks of insects, as to make them eagerly sought after by all the knowing ones.

**This  
is Our  
Offer.**

For one NEW subscription to American Gardening at \$1.00, we will forward you, all charges prepaid, your choice of two of the three following varieties:

Meg Merrilies, Red.  
Anne of Geierstein, Pink.  
Brenda, Blush White.

The above to be well-established plants out of 2½ inch pots.

The collection of Three above Plants for one NEW SUBSCRIPTION to American Gardening at \$1.25.

These plants will be forwarded to our subscribers direct from the growers, eminently responsible people, who guarantee them to be true to name and color.

Plants ready for shipment May 1. Orders booked now, however, owing to the expected enormous demand.

## OUR GREATEST 1897 PREMIUM

The Wonderful New Climbing Rose

# Yellow Rambler (Aglaia)

A worthy COMPANION to the well-known Crimson Rambler.  
The Hardest Yellow Climbing Rose Ever Introduced.

**Yellow Rambler** bears its flowers in immense clusters, often as many as one hundred and fifty blossoms in a bunch, the trusses being of handsome pyramidal shape.

A CLUSTER OF YELLOW RAMBLER ROSES.

**Yellow Rambler** holds its blooms from three to four weeks without fading; a large bush in full bloom is one of the most beautiful sights imaginable.

**Yellow Rambler** is a clear decided yellow, in marked contrast to many roses so described, but which have really only a yellow tinge.

**Yellow Rambler** is very vigorous; well-established plants often making shoots eight to ten feet in height in a single season.

**Yellow Rambler** represents the triumph of the century in the hybridizing art, and is the most valuable introduction in recent years.

**Yellow Rambler** is very sweetly scented.

**Yellow Rambler** combines the climbing habit and decided yellow color with hardiness.

**Yellow Rambler** will withstand, without protection, a zero temperature; with protection it will thrive where any other rose will.

**Yellow Rambler** is thus adapted to successful culture in nearly all of the northern parts of the United States.

**Yellow Rambler is absolutely NEW on the market and will prove the sensation of 1897!**

**Yellow Rambler** premiums will be shipped direct to our subscribers from the introducers, one of the largest and most reliable firms of nurserymen in the country.

**All stock** is guaranteed pure and will be shipped in good condition.

**DON'T YOU WANT A YELLOW RAMBLER ROSE?**

You Can Earn One in Ten Minutes!

**READ OUR OFFER.** We will forward, all charges prepaid, one well-established plant of **Yellow Rambler Rose**, from 2½ inch pot, for ONE NEW SUBSCRIPTION to American Gardening at \$1.00, or six plants for five NEW subscriptions at \$1.00 each.

The same plant will not be sold in 1897 for less than 50 cents. Plants will be shipped on and after March 15th. It is expected that the demand for this New Rose will be phenomenal, and we advise those of our readers who want a plant to be early with their order.

## Offer No. 56.

**GLADIOLUS BULBS.**

The following offers on Gladiolus Bulbs are well worth striving for. Your choice of one of the two collections offered for only one new subscription at \$1.00. Sent, postpaid, in neat pasteboard boxes. Order by Offer No and Letter.

**A.—6 Bulbs each of May, Bertha, Mabel, and Marie Lemoine.**

**May.**—Large spike, well expanded flowers. White, edge of petals touched pink. A grand variety.

**Bertha.**—This is the finest variety of its color, which is a brilliant light scarlet. Makes a tall spike, with large side branches.

**Mabel.**—Dwarf, upright habit. Full spike open at one time. In color it is a blending of carmine, cherry and pink. One of the first to bloom.

**Marie Lemoine.**—Upper division of flowers of pale creamy color, flushed salmon lilac, the lower petals spotted purplish violet, bordered canary yellow. Peacock blotched.

**B.—100 Cushman's High Grade Seedling Gladioli.**

All blooming size. Not two alike. Rivaling the floccelle silks in coloring and sheen.

## Offer No. 69.

**VEGETABLE SEEDS.**

The following collection of Seeds is offered by a reliable grower, with a view to introducing his stock. They are of precisely the same grade as is sold to market gardeners and all desiring the best. The entire collection of twenty named varieties will be sent, postpaid, for one new subscription at \$1.00.

One oz. Beet, Eclipse; one pkt. Cabbage, Early Wakefield; one pkt. Cabbage, Early Flat Dutch; one pkt. Cabbage, Savoy Early; one pkt. Cabbage, Savoy Late; one pkt. Cauliflower, Erfurt; one-half oz. Carrot, Half Long Nantes; one pkt. Celery, Paris Yellow; one oz. Sweet Corn, Early Mammoth; one pkt. Cucumber, White Spine; one pkt. Onions, Early Flat, Red or White; one pkt. Parsley, Double Curled; one pkt. Lettuce, Summer Blonde; one pkt. Radish, Early White Tipped; one pkt. Tomato, Acme; one pkt. Spinach, Viroflay; one pkt. Squash, Early Bush; one pkt. Turnip, Red Top; one pkt. Rutabaga, Champion; one pkt. New Victoria Spinach.

## Offer No. 57.

**CHRYSANTHEMUMS**

For one new subscription and \$1.00, we will forward, postpaid,

**A Collection of 36 Plants.**

All different; prize-winning varieties, comprised in great part of last year's novelties, in all shades of color and types of bloom.

This offer comes from a noted grower, and we hope to receive a great many orders for this collection.

## Offer No. 79.

**Loudon Raspberry  
Ohmer Blackberry**

Three of each, or six of one variety. Sent, postpaid, for one NEW subscription at \$1.00.

## GROWER SAYS:

"Nice plants, well established in pots, like Verbena plants, 5 to 6 inches high, with a mass of roots. They grow off as well as strawberry plants, and really are better for making a plantation than plants a year older. They will thrive, and be larger and better next fall than year-old-plants set along side of them. I have tried this several seasons and know what I am talking about. Although more delicate at first than year-old-plants, with reasonable care they do splendidly."

**Loudon Raspberry** is one of the very best of all red varieties, of large size, very productive, good color, excellent quality.

**Ohmer Blackberry** has five excellent points. "Hardy, late, large, productive, and of the finest flavor."

## Offer No. 50.

**THE COMPLETE  
VEGETABLE GARDEN.**

Plants all ready to set out.

All good plants. Grown in Maryland. Delivery April 15, postpaid. This is an offer we are not able to make our friends every week in the year, and we will be mistaken if this Bargain is not taken advantage of by thousands.

12 Peppers, two kinds.

12 Egg Plants.

12 Cauliflower Snowball.

12 Tomatoes, two kinds, select.

50 Cabbage or Sweet Potato Plants.

50 Lettuce, two kinds.

148 choice vegetable plants and AMERICAN GARDENING one year, to a NEW name, for only \$1.00.

## Offer No. 60.

**CACTUS.**

The following collection will be sent for one new subscription at \$1.00, with 35 cents additional to prepay express charges. The plants offered are worth \$2.00 at retail, and come from a noted collector.

One plant each of

*Astrophytum myrtilloides*.

*Anhalonium Lewinii*.

*Mammillaria dichapens*.

"Hederii.

*Echinocactus setispinus*.

*Berlandieri*.

*Opuntia Engelmannii*.

*Senilis*.

## Offer No. 71.

One plant each of....

**Japanese Mammoth Chestnut,  
Japan Walnut and Pecan.**

By mail, postpaid, for one new subscription.

The Japan Mammoth Chestnut is quite distinct from the American or European varieties, being hardier, nuts of superior size, flavor and sweetness. Leaf long and narrow, like a peach leaf, and very ornamental; enormously productive and comes into bearing at two to three years of age.

Japan Walnut is as hardy as an oak; leaves of immense size and a charming shade of green. Nuts, which are produced in extreme abundance, grow in clusters of fifteen or twenty; have a shell thicker than the Persian Walnut, but not so thick as the American. The meat is sweet; of the very best quality; flavor like the Butternut, less oily and much superior. Trees grow with great vigor, assuming a very handsome form and need no pruning; mature early; bear young, and are more regular and productive than the Persian Walnut. Having an abundance of fibrous roots it transplants as safely as an apple tree.

Pecan, Paper-Shell—a beautiful symmetrical and rapid growing tree, of luxuriant foliage, which it retains until very late in the Fall; producing valuable timber and heavy crops of sweet, oblong, smooth nuts of very good quality. Makes a handsome lawn tree, hardy wherever the hickory grows.

## Offer No. 59.

**GRAPES**

Every country and suburban home needs a vineyard, and those who avail themselves of the offer which follows will be well satisfied and pleased for years to come with the result A grower offers:

Agawam,

Lindley,

Brighton,

Worden,

Niagara,

Moore's Early.

Your choice of Ten 1-year vines, all of one variety, or three each of three of the above sorts, for only one new subscription. Forwarded postpaid.

# OUR PREMIUMS ARE OFFERED

them to obtain the new subscriber and retain the premium. If the subscriber they procure wants a premium (and he doubtless will,) he, in turn, should interest himself in the same way. New names sent in direct are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

## Offer No. 54.

### THAT GRAND NEW SINGLE VIOLET PRINCESS of WALES

Away and beyond the best of all the single varieties lately introduced. The Queen of Single Violets. Fragrance equal to Marie Louise. Blooms very large, strong grower and productive. Grower, who is one of our most renowned violet experts, will send, postpaid, for one new subscription,

Eight (8) good rooted plants, with some flowers accompanying same; carefully packed for safe arrival. Plants ready Feb. 15. Grown in New York.

## Offer No. 43

### DAHLIAS

The recent revival of interest in this most worthy class of plants, coupled with the introduction of many new and interesting varieties, renders it incumbent on every one to see to it that their garden is supplied with the best obtainable.

Any one of the three collections here offered will be found up-to-date and choicest kinds, and as they come from celebrated growers and prize winners, we can assure our friends we are offering them a remarkably good thing and trust they will not be slow to take advantage of one or more of these offers.

#### A—Four Superb Cactus Dahlias.

One strong root each, Wm. Agnew, Oriental, Nymphaea and Zulu, by mail, postpaid, for one new subscription.

#### B—Four Show and Fancy Dahlias. (Dwarf)

One strong root each, New Double Tom Thumb, Arabella, Blumenfalter and Lucy Faucett, by mail, postpaid, for one new subscription.

#### C—Four Pompon or Bouquet Dahlias.

One strong root each, Elegante, Sprig, Ariel and Vivid, by mail, postpaid, for one new subscription.

Any one of these collections is worth over \$1.00 at retail, but will be sent postpaid, carefully packed, and guaranteed to arrive in first-class condition for one NEW subscription to AMERICAN GARDENING at \$1.00. Order by Offer No. and Letter.

## Offer No. 49.

Sent, postpaid, for ONE NEW subscription at \$1.

### SUMMER BEDDING 150 OXALIS BULBS

These bulbs make beautiful borders for summer flower beds, as well as attractive pot plants. The collection includes 150 Bulbs in equal proportions of the four following varieties, named, and in separate packets:

OXALIS DEPPEI ALBA.—White.  
OXALIS DEPPEI ROSEA.—Old rose or salmon.  
OXALIS ERYTHILLA PURPUREA.—Purple.  
OXALIS LASLANDRA.—Crimson. Tall, fine palmate leaves.

## Offer No. 48.

Every Gardener Needs a

### ....GOOD GOOSEBERRY....

And, we will send two one-year plants, of the best new variety known, for one new subscription; safe delivery guaranteed.

### THE PEARL GOOSEBERRY.

Read what the Introducer has to say: "The Pearl is a gooseberry grown from the seed of Houghton, crossed with Ashton seedling, by Prof. Wm. Saunders, and worthy of special notice because (1) of its good quality; (2) its size; (3) its productiveness; (4) its freedom from mildew. As a result of my observation I find the quality good, very much like the Downing in this respect, as well as in color marking; but in size it averages nearly double that berry, and that in spite of the prodigious crop under which the bushes are laden. There was a row of some sixty fine bushes one year planted, and most of them were literally bent to the ground with heaps of fruit. The average was eight berries per inch of wood, and on one bush we estimated that there must have been 2,500 berries. Should this productiveness prove constant the berry will be of great value for the market. With regard to the mildew, all I can say is what I have seen, namely: After seven years of trial I have never found any trace of mildew."

## Offer No. 52.

### Collection of Flower Seeds

Sent, postpaid, for one new subscription to AMERICAN GARDENING. The following list embraces 16 varieties of choice flower seeds; fresh and true to name, eight of which are of 5 cent packets, six of 10 cent packets, and two of 15 cent packets valued in all at \$1.30. Offer No. 35.

SENT postpaid, for ONE NEW subscription at \$1.00

....BEAUTIFUL....

## Twelve Everblooming Roses

Grower's selection from leading varieties.

Of all premium offers this is decidedly one of the most tempting and we fully guarantee its absolute reliability. Grower says: "We will fill your orders with strong well-ripened plants, grown specially for the purpose, from 2½ inch pots. This is our most popular collection and it has made hundreds of customers for us, as the testimonials in our possession will show." In this collection will be found such varieties as:

Perle  
F. Kruger  
The Bride

Virginia  
Snowflake  
Bon Silene  
Empress of China

Bridesmaid  
Pink Souper  
Naman Cochet  
Prince Hohenzollern

Cornelia Cook  
Maurice Rouvier  
Catherine Mermet

The collection embraces a variety of colors, each plant is distinctly labeled, and the collection will make a beautiful bed. Packed in stiff, telescoped pasteboard boxes, all finished on inside, and shipped to any address in the U. S. in good condition.

Orders for this collection can be filled at any time, but subscribers in the North and West are advised not to have their orders filled until April 1, or later.

Offer No. 47.

Sent, Postpaid, for one NEW Subscription at \$1.00.

## NEW GIANT FANCY COSMOS

(MRS. SHEPHERD'S STRAIN).

Mrs. Shepherd's New Fancy Cosmos was offered for the first time last season, but this is the first time they have been offered, put up in separate colors, as here described:

Of this strain, five packets of which are offered in this collection, the grower, Mrs. T. B. Shepherd, of Ventura, California, says:

"No one else grows it, and it is so distinct as to be readily recognized anywhere by one who has once seen the different varieties in bloom. I have been working with it so long that it has an individuality peculiarly its own."

One packet of the above, in splendid assortment, containing over 35 varieties of beautiful flowers, in all shades of red, pink, mauve, tinted and white... 15c.

Three packets of above, in separate colors, Red, Pink and White, one packet of each, at 15c..... 45c.

"Tints of Dawn," one packet of above, lovely tinted flowers, white ground, delicately tinted or flecked with pink or mauve in lighter or darker shades..... 15c.

Curlled and Crested ZINNIA'S, splendid mixed, one pkt..... 10c.

These are the gayest, brightest and most esthetic bedding flowers imaginable, all colors and shades, with petals daintily curled and crested, having none of the coarseness of other Zinnias.

IPOMCEA, Heavenly Blue, one pkt..... 10c.

A perfect dream of beauty.

SCABIOSA, New Large Flowering, red and pink varieties, mixed, one pkt..... 10c.

These are very beautiful.

Total Value.....\$1.05

The Choicest Collection of Seeds ever sent out for the money; a poem in flowers and a revelation in nature.

Offer No. 64.

## POTATOES

One half pound each of the four following varieties sent, postpaid, for one new subscription:

Early Michigan.  
Early Fortune.

Carman's No. 3.  
Livingston's Banner.

Two pounds or eight potatoes in all.

Option: One pound Early Michigan, or two pounds of any one of the other three varieties. Grown in Michigan.

Offer No. 63.

## FRENCH FILBERT (Improved)

(Corylus Fertilis).

Three Plants, two years old, postpaid, for one new subscription. Will grow in any kind of soil; stands cold and drought well; free from insect pests; yields large nuts of superior taste; each bush will bear about 1 lb. at three years, increasing to an average of about 10 lbs. a year. Raised in California.

Offer No. 55.

One plant each of....

### Starr, Parlin Beauty and Bismarck Apples.

By mail, postpaid, for one new subscription.

**Starr.** Fruit very large, 11 to 12 inches around, showy, pale green, frequently with handsome bluish on sunny side; very early; an excellent shipper; superior cooking and very good eating apple.

**Parlin.** Very hardy; a good grower and productive. Fruit splashed and striped with red; September.

**Bismarck.** Dwarf and extremely prolific. Most suitable apple for hot climate, yet the hardest known. A wonderful bearer. Fruit is large, brilliant in color, handsome. Flesh tender, pleasantly sub-acid; of distinct and most delicious flavor, unequalled as a dessert apple and very superior for cooking. Will keep until March.

Offer No. 62.

One plant each of....

### Keonsee Pear, Rocky Mt Cherry, Trifoliate Orange, and Starr Apple.

By mail, postpaid, for one new subscription.

**Keonsee Pear.** This is an early pear, of striking beauty, fair quality and great value. Claimed to be a better grower than Kieffer. Fruit medium to large, skin yellow and bright red on one side. It does not rot at the core, and it the best early pear. Its strong, vigorous growth, freedom from blight, early bearing, immense productiveness, early ripening, beautiful appearance, large size and quality combine to render it the most valuable early market pear before the public and will be largely planted.

**Rocky Mountain Dwarf Cherry.** Fruit jet black when ripe, in size larger than the English Morello; season late. As prolific as a currant bush. Height four feet. Free from disease. In addition to its luscious fruit it makes a handsome flowering bush, with its mass of pure white flowers.

**The Trifoliate Orange.** This is a hardy dwarf tree, of symmetrical growth, with beautiful trifoliate glossy green leaves and an abundance of large, white, sweet-scented blossoms, larger and finer than any other variety, and borne almost continuously. A conspicuous and showy plant, for lawn or pleasure ground.

Offer No. 67.

Two plants each of....

### Logan Berry, Rubus sorbifolius and Japanese Mayberry.

By mail, postpaid, for one new subscription.

**The Logan Berry (Raspberry-Blackberry)** is a decided novelty, and promises to be a valuable addition to our fruits. The plants are described as unlike either the Raspberry or Blackberry, and are of low growing habit with fine soft spines, like those found on Raspberry plants; leaves of deep green color, coarse and thick, more like those of the Raspberry than Blackberry. The fruit is as large as the largest size Blackberry, is of the same shape, with globules similar to that fruit; color, when fully ripe, a dark rich red. It partakes of both the flavors of the Raspberry and Blackberry, being a combination of the two mixed, a very pleasant, mild, vinous flavor, delightful to the taste, not found in any other fruit, but peculiar to this alone. It is excellent for the table, eaten fresh or cooked, and for jelly or jams without an equal. The fruit is firm and carries well, seed small and few. The vines are enormous bearers. Ripening very early—beginning with Strawberries and the bulk or nearly all, ripe and gone before Raspberries become plentiful, rendering it a very valuable fruit for market. Genuine stock very limited. Beware of seedlings offered by some.

**Rubus Sorbifolius (Strawberry-Raspberry).** While the fruit is regarded with favor by many, we would commend the plant most as an ornament for a corner of the garden or lawn, where a strong rampant growth is required. Its snow-white blossoms are very fragrant, and the plant is covered with beautiful fiery crimson translucent berries from early in July until frost.

**Child's (Burbank's) Mayberry.** An improved variety of the Mayberry, the result of a cross with the Cuthbert Raspberry, and described by the introducer as the most remarkable of all fruit novelties ever introduced. It grows in sturdy form six to eight feet high, and ripens its fruits before Strawberries and a month before the earliest Raspberries. The bushes are distinct from other berries, with spreading tree-like tops, large, bell-shaped, pendulous blossoms, which hang along the entire length of the branches in pairs or triplets. These large handsome blossoms are followed by great glossy berries, which are of a golden yellow color, and in quality sweet and luscious beyond description. Its earliness makes it the most important of all fruits.

# OUR PREMIUMS ARE OFFERED

with a view to interesting present subscribers to obtain us **New Subscriptions**, and for so doing we expect them to **obtain** the new subscriber and **retain** the premium. If the subscriber they procure wants a premium (and he doubtless will) he, in turn, should interest himself in the same way. **New names sent in direct** are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

## Offer No. 1.

### STRAWBERRIES

Your choice of 50 plants in any two varieties below mentioned, 25 of each. Sent postpaid for one new subscription. Plants guaranteed to arrive in good condition. Plants grown in New York. Order by Offer No. and Letter.

A Beder Wood (B)	J Jessie (B)

## Offer No. 6.

### STRAWBERRIES

15 Plants Marshall (B) and  
15 " Brandywine (B)

By mail, postpaid, for One New subscription. This collection can be implicitly relied upon as being true to name and of the very best grade of stock. Raised in New York.

## Offer No. 7.

### STRAWBERRIES

12 Ima (P) New.....50c.  
(A new seedling of great promise.)  
12 Cumberland (B).....25c.  
12 Dayton (B).....25c.  
12 Gandy (B).....25c.

This entire collection of 48 plants, valued at \$1.25, will be sent, postpaid, for one NEW subscription to AMERICAN GARDENING. Plants raised in Ohio.

Introducer's Description of Ima.—"A seedling of great merit, and a berry which, having carefully watched for the past four years, we are now convinced deserves to be enrolled among the worthy members of the strawberry family. In ripening it is about midway between the early and late varieties. It is a long pointed berry. It will ripen quickly, and perfectly all over. In color, a beautiful bright red, and in size equals the Crescent or Warfield. It is a strong grower and as large a producer as any variety we have ever fruited. To sum up its meritorious points, it is perfect in color, shape, and flavor; a good shipping berry of large size and very fruitful. A profitable berry for the fruit grower to raise."

## Offer No. 16.

### STRAWBERRIES

75 Plants Greenville (P)

Raised in Ohio. Mailed, postpaid, to any address for One New Subscription.

Berries of large size, good quality, medium texture, very productive, season medium to late, color very even and fine, flowers pistillate, plants very vigorous and free from rust. A first-class market berry and good enough for home use.

## Offer No. 18.

### COLLECTION OF 125 STRAWBERRIES

Good plants and named. Delivery postpaid, on and after April 1. Plants raised in Maryland.

Meek's Early (B.)  
Baltimore.  
Sharpless (B.)  
Levianth.  
Kentucky Late.

Grower says: Kentucky Late is a berry that is largely grown here for market and shipping purposes, coming in after the glut of other varieties is over; it is a very late berry, extending the season sometimes two weeks.

Levianth, very large, vigorous grower, suitable for family use where an extra-sized berry is looked for; fruit rather tender.

## Offer No. 44.

### LOUDON RED RASPBERRY.

Five (5) Plants for one new subscription at \$1.00.

This Red Raspberry is pronounced by Mr. Thayer and other leading horticulturists as the best of all reds for the East and West. It was originated by F. W. Loudon, of Wisconsin, originator of Jessie Strawberry.

## Offer No. 5.

	O.—25 Staples (B)

Order by Offer No. and Letter.

The above collection is a good one, and are all standard sorts, embracing the earliest and latest varieties. All nice plants and true to name. Raised in Virginia.

Rio is a fancy berry for early, and one of the best shippers; planted beside Bisel they make a splendid variety to ship together.

## Offer No. 15.

### STRAWBERRIES

25 Brandywine (B)  
25 Staples (B)

This collection will be sent postpaid to any address in the United States for one new subscription. Guaranteed to reach customers in good condition. Plants are extra rooted, and positively true to name. Will be mailed at any time after April 10. Plants raised in Ohio.

## Offer No. 13.

### STRAWBERRIES

Below mentioned collection of 36 Fine Plants will be sent, postpaid, for one new subscription. Grown in Maine.

New Seedling No. 4. 12 plants.  
12 plants of the celebrated Brandywine,

And your choice of 12 plants of any one of the following most popular standards: Bubach, Haverland, Warfield, Beverly, Parker Earle, Lovett, Princeton Chief.

Of Seedling No. 4, grower says: This is of exceedingly fine quality—the best of anything I have ever tasted, and so say they all who have sampled it. Good form, medium size, very productive, and a most remarkably strong and healthy grower. An A family berry, and a grand one for a nearby fancy market that appreciates quality. It has a pistillate blossom. Those who avail themselves of the present opportunity to procure this grand berry will be among the wise as, in the course of two years' time, it is likely to be introduced under name at \$2 per dozen.

Grower offers 36 plants in all, in three varieties packed in the best manner, for delivery in April or May, and says: These plants of standard varieties must not be confounded with the common commercial article, but comprise carefully selected stock that has been built up by an attentive selection of the best individual plants each year, for five consecutive years, by one of the most noted growers of fancy strawberries in the Eastern States.

## Offer No. 21.

**STRAWBERRIES**

Your choice of twenty-four (24) plants in two varieties, twelve (12) of each, or 25 of any one. Free by mail for one NEW subscription. Raised in Virginia.

12 Mary (P)	12 Aroma (B)
12 Edith (P)	12 Pride of Cumberland (B)
12 Splendid (B)	12 H. W. Beecher (B)
12 Enormous (P)	
12 Wm. Belt (B)	

The above comprise some of the largest berries in cultivation, particularly Edith. These are all nice plants and true to name.

## Offer No. 26.

**STRAWBERRIES**

Raised in Pennsylvania. Subscriber's choice of any one of these varieties sent postpaid for one new subscription. Order by Offer No. and Letter.

A-15 Glen Mary (P)	I-20 Ideal (B)
B-15 Clyde (B)	J-20 Oriole (P)
C-25 Michigan (B)	K-20 Howell's No. 2
D-25 Wm. Belt (B)	L-10 Plow City (B)
E-25 Champion of England (B)	M-60 Brandywine
F-25 Equinox	N-60 Enormous (P)
G-25 Sparta (B)	O-60 Bisel (P)
H-25 Murray	P-60 Staples (B)
	Q-35 Gertrude

All plants to be freshly dug and well packed in moss; all inferior plants discarded and only the best sent.

## Offer No. 9.

**STRAWBERRIES**

For One New Subscription at \$1.00. Plants raised in Indiana. Order by Offer No. and Letter.

- A.—Postpaid, six plants Ridgeway.  
 B.—Postpaid, three plants Ridgeway, three plants Tennyson, three plants No. 1000, six plants Parker Earle.  
 C.—Postpaid, three plants Ridgeway and one dozen plants, one variety. Your selection from this list: Brandywine, Clyde, Annie Laurie, Jersey Queen, Aroma, Moore's Prolific, Mary, Premium, Berlin, Tubbs, Parker Earle, Holland, Gen. Putnam, Dew, Columbian, Tennessee Prolific, Lady Thompson.  
 D.—Postpaid, three dozen plants, not less than one dozen of a kind, any variety named in C, the Ridgeway excepted.  
 E.—By express, at purchaser's expense, three plants Ridgeway, and 100 plants, not more than two varieties. Your selection from this list: Brandywine, Clyde, Dew, Holland, Gen. Putnam, Jersey Queen, Columbian, Lady Thompson, Tennessee Prolific, Annie Laurie, Staples, Parker Earle, Splendid or Isabella.

This is the first season the Ridgeway will be placed on the market, consequently our readers are given an opportunity to be among the first in the cultivation of the promising berry. Description is as follows:

**Ridgeway.**—Plant large and stocky, possessing the ability to make a large number of strong, healthy plants. Leaf large, broad, heavy and dark green in color. Blossom perfect, a good pollinizer for pistillate varieties, as it remains in bloom for a long time, an ideal plant.

Berry large to very large, the typical form nearly round, largest specimens broadly ovate, but always smooth. Color, as it grows at Rocky Glen, bright glossy crimson, with golden seeds. Firm for so large a berry, and will stand shipping to distant market, except in a very wet time. Quality as good as the best, an almost ideal berry, one that will command fancy prices on any market or suit the most exacting grower, who wishes the very best for his own use and pleasure.

Orders will be filled as early in the spring as conditions are favorable for shipping.

## Offer No. 22.

**STRAWBERRIES**

50 Plants Fountain Strawberry.

Raised in Michigan. Sent, postpaid, for one new subscription.

One of the later introductions that is receiving much praise. The Fountain is described as large and handsome, of a deep, glossy, red color, flesh red and solid to the center. Firm and productive. Plant large, vigorous, healthy and hardy, with a perfect blossom. The grower who offers this variety states that it is one of the best all around good berries in his collection of over 100 varieties, and one that is likely to be in great demand in the near future as a choice shipping variety.

## Offer No. 23.

**STRAWBERRIES**

Grown in Michigan. The following collections are offered, postpaid, for one new subscription:

## Collection A.

12 Beder Wood (P)	12 Greenville (P)
12 Lovette (B)	12 Haverland (P)
	12 Woolverton (B)

This collection will be sent as advertised, or will give subscriber the choice of 75 of any one of the above varieties.

## Collection B.

25 plants Gold Standard (B).

Grower says: This is a strong growing variety, large round leaves, free from rust, one plant weighs as much as two common plants. The fruits average from one to one and a half inches, light red in color, and the sweetest berry we ever tasted. Season late. Strongly staminate.

## Offer No. 27.

**STRAWBERRIES**

Your choice of any one of the below mentioned collections, postpaid, for one new subscription. Raised in Ohio.

A-25 Greenville and 15 Lovett.
B-40 Lovett or 40 Dayton Early.
C-20 Bubach No. 5 and 20 Jessie.
D-40 Warfield and 20 Cumberland.
E-20 Haverland, 10 Dayton, 10 Parker Earle.

In the above collections when one is a pistillate sort the other is a perfect bloomer, so that they can be planted together perfectly.

## Offer No. 28.

**STRAWBERRIES**

This collection will be sent for one new subscription. Plants raised in Wisconsin.

25 Plants Sparta.

6 " Thayer's No. 5.

The Sparta is Wisconsin's premium berry (staminate), very large, beautiful in color, and a great favorite with M. A. Thayer, who introduced it. Thayer's No. 5 is a new seedling, originated on the Thayer Fruit Farms, and this year for the first time sent to any one.

## Offer No. 29.

**STRAWBERRIES**

Sent postpaid for one new subscription. Plants raised in Michigan. Strictly first-class plants, mailed same day they are dug, put up in sphagnum moss, wrapped in oiled paper to retain moisture. Your choice of two kinds, 18 of each; or 25 plants, one kind, good count. No orders filled after April 15th. I offer the following varieties:

Brandywine (B)	Splendid (P)
Greenville (P)	Bisel (P)
Bubach No. 5 (B)	Lovett (B)
Parker Earle (P)	Jessie (B)
Haverland (B)	

## Offer No. 24.

**STRAWBERRIES**

A-50 Plants Brandywine (B)
B-12 " Bismarck (B)
C-24 " Wm. Belt (B)

Order by Offer No. and Letter. Subscriber's choice of any one of these three varieties for one new subscription. All first-class and new varieties. Grown in Michigan.

## Offer No. 25.

**STRAWBERRIES**

We will send Twelve (12) plants, two each of the following varieties: 2 Carrie; 2 Earliest, the earliest berry yet introduced; 2 Equinox, the latest; 2 Clyde, one of the earliest, will do better where land is not too rich; 2 Belle; 2 Evans. One dozen in all of these choice novelties. Select plants and guaranteed true to name. Raised in Virginia. Sent, postpaid, for one NEW subscription.

## Offer No. 30.

**STRAWBERRIES**

Your choice of any one of the following offers, postpaid, for one new subscription. Order by offer No. and Letter. Plants raised in Maryland.

A-4 Hall's Favorite (new).	F-30 Tenn. Prolific.
B-25 Brandywine.	G-35 Warfield, No. 3.
C-30 Haverland.	H-30 Tubbs.
D-25 Hoffman's.	J-15 Ideal.
E-25 Lady Thompson.	K-25 Bubach, No. 5.

Two plants of Hall's Favorite are included in every offer from B. to K.

Grower describes Hall's Favorite as follows: The coming new strawberry. It defies competition. Better than Bubach No. 5.

## Offer No. 31.

**STRAWBERRIES**

Plants raised in Iowa. The below collection will be sent, postpaid, for one new subscription.

One hundred plants of either Haverland, Enhance, Greenville, Beder Wood or Tennessee Prolific, or twenty of each of the above five varieties.

## Offer No. 2.

**Strawberries and Raspberries.**

Your choice of either one of these collections for one new subscription at \$1.00. Sent postpaid. Plants raised in Delaware. Order by Offer No. and Letter.

A-100 Strawberry Plants, two choice varieties.

B-12 Miller Raspberry Plants. The best early Red Raspberry that has been thoroughly tested.

## Offer No. 8.

**STRAWBERRIES**

Your choice of any one of the following collections, prepaid, for one new subscription. Order by Offer No. and Letter.

- A—Four plants Kyle (B).  
 B.—Your choice of 12 plants, three each of any four of the following kinds: Bisel, Splendid, Brandywine, Van Deman, Plow City (large, late), Gertrude (early), Kyle, Wm. Belt.  
 C.—25 plants Splendid. "Correctly named," says J. L. Hartwell, President No. 111. Hort. Society.  
 D.—12 plants Splendid, 12 plants Van Deman (fine early).  
 This gives a succession.

Kyle is productive, fair size, rich acid flavor, firm and of a shiny, rich carmine color; quite attractive in appearance. It is a vigorous, healthy grower; makes runners freely, and so far has not developed a single defect. It is smooth and uniform in shape; stands heat and cold well. Its season is medium early. It is self-fertilizing, but not strongly so. A decided acquisition.

**Danish Ballhead Cabbage.**

IMPORTED RELIABLE SEED.

Prices on application. Catalogue Free.

### A Promising New Primula.

The illustration (fig. 65), which accompanies this note is a faithful representation of a plant and detached inflorescence of a new Primula, of which we are disposed to think very highly. While not having flowers of the same size as the well-known Chinese Primula, the plant now under consideration attracts notice by the manner in which its flowers are borne—successive tiers or whorls at intervals along on otherwise bare stem. In this particular the plant recalls several species of Primula, as *P. japonica* for example, and when in full bloom is most charming.

The flowers are white, and though not very large, are produced in such profusion as to show a wealth of bloom at almost any time, for the plant keeps in flower for a long period. Our illustration, though considerably reduced in size as compared with the plant will afford a fair idea of its appearance; the detached flowering stem is reduced by a trifle more than one-half.

For the opportunity of giving this notice we are indebted to the courtesy of Mrs. John Thatcher, who

writes as follows: "In the garden of Charles Dissel, Esq., Wynnewood, Pa., is a small batch of Sutton's new *Primula stellata*, which is one of the best of recent introductions to the Primula family. The plant is of a compact habit; the foliage is very dark purple; the flowers are pure white, about three-fourths inch in diameter, produced in tiers one above the other, reaching twenty inches in height. The plants have been flowering here since the middle of December and show every appearance of continuing for a long time yet. The seed should be sown in April to get good sized plants, and given a little more sun than is usual for *P. sinensis*. This Primula when better known will, I think, be largely grown by florists and private gardeners."

We would add to the foregoing the suggestion of utility as an amateur's window plant, for which purpose its long flowering qualities specially recommend it.

The *Primula stellata* is not a new "species," but is a developed strain of *P. sinensis*—perhaps here is another instance of that origin of species which it is the fortune of the gardener to see from its inception.

FIG. 65.—PRIMULA STELLATA. Detached inflorescence reduced one half.

## Eastern N. Y. Horticulturists Meet.

The newly formed society met at Poughkeepsie on March 12 and 13; the proceedings were full of interest and the future of the organization looks bright. The first session was called to order by the president, the Hon. James Wood, at 10:45 A. M. On taking a roll call of the counties Ulster led the way in attendance, with forty-five, Columbia, Dutchess and Orange counties followed in the order named. Those in attendance were invited to state what was needed most in the interest of their respective counties.

J. Potts said they needed cheaper transportation and less commission to be paid on sales. Mr. Morrell requested that insect pests be looked after by a committee. Mr. Harrison said that express and freight rates needed the care of a special committee. Mr. Taber said what was needed was better fruit and more uniform packages. Mr. Williams, of Highland, said that Ulster was the pioneer county in the fruit business, but he seriously thought that it would have to look to its laurels, and needed to raise not more but better fruit to meet competition.

Mr. Weed said that sometimes a farmer sent corn to the mill in a bag with a hole in it; he attempted to stop the spilling by filling up the hole with a corn cob or a bunch of grass or straw. In spite of this the grain was often lost on the way, but the loss was always laid to the miller. So he thought the fruit grower never blamed himself for oversights or negligence but usually the commission man or express company. He thought there was a hole in the bag in some of the packages used for shipping purposes.

Mr. Husted thought home markets should be cultivated more, transportation rates reduced and better relationship established with the commission man.

Dr. Hexamer advised the growers to get themselves better acquainted with market requirements; he thought there was some schooling needed in that direction, and, after all, the market was where everything centered. Quoting from his own experience, he said the fault was not always with the commission man, but with the condition in which stock reached him. He had started goods from home—and they looked perfect at that time—he had gone to the market and seen them received in wretched condition. Had he not seen for himself he would have hardly been able to believe the possibility.

Mr. Rice agreed with all that had been said as being right and proper, but he would like to discover some way in which growers could be protected from the many rascals which come between him and consumers.

Dr. F. M. Hexamer formally moved the following amendment to the by-laws: That the name be changed from Hudson Valley to Eastern New York Horticultural Society, for with the former name he felt sure that growers in Long Island, Staten Island, Westchester and Putnam counties were feeling that they were excluded. W. F. Taber seconded the amendment, stating that he first thought that the present name would serve all interests, but was now of opinion that in order to get the co-operation of all the counties and the kindred interests of each united the broader name was necessary.

J. B. Rogers, of Newark, N. J., was then introduced to the meeting. He said: "Mr. President, I am delegated to attend this meeting to-day and convey to you and all who shall assemble here the greeting of your sister society. The New Jersey Horticultural Society wishes your society all prosperity and extends the hand of fellowship." (Applause.)

### President's Address.

Mr. Wood said the need of such a society is great, since the business we are engaged in is so complex. Ever since history began men have been engaged in agriculture, and the best thought of all the ages has been brought to bear upon the subject, yet its intricacies are but dimly understood, and if this be true of agriculture, it is even more so of horticulture. Many people want to separate these two, but the only difference

is that "agri" means one crop and "horti" many crops. We have developed from one crop to many, or rather our fields have become gardens. With the multiplication of crops an endless list of varieties has come into existence, and the horticulturist needs to keep posted and brushed up from time to time. He must know what is going on around him, must familiarize himself with all that is new. Hybrids and sports are springing up all the time, and the seed list gets bewildering. Then the higher the cultivation the more artificial the life, and, therefore, the more liable to disease. At this time we are brought face to face with stern realities; we grow to sell, but the times are not propitious, the markets have been against us. To-day we have 55 experiment stations and 5,000 scientists working for us, and here in our own section another great helper—the horticultural press—working for us day by day. The Country Gentleman, American Gardening, American Agriculturist and the Rural New Yorker are all published in this our own territory. Are we taking advantage of them all? The difficulties that we have recently come through are perhaps nothing to what we may encounter. Years ago the market sought us, now we have to seek a market; we are dismayed at the outlook; 10,000 new shippers have stolen our market and are making their goods more presentable than ours. This is a question of package and freight; how did these distant brethren accomplish all this? Was it individual effort? No. It is the result of organized effort. We must not work alone, but rather organize. There are reasons why we should do so at the present moment. California holds the market with beauty and size, and this must be met with solid, substantial, superior flavor at home. The day is very near when California peaches and pears will not pay for transportation and of commission. How is he alone to remedy it? A grower that goes alone into the fight with the companies will have nothing behind him, and no redress. But it will be different when his district and the whole united society speak for him.

### Fertility.

Professor Jordan, director of the New York Experiment Station at Geneva, said we usually measure fertility by what we get out of the land rather than by what is in it. In the soil plants need to be happy, but this cannot be so when their feet are in water, and we forget to supply the same with wholesome food and surroundings, and then fail to care for it afterward. There are fourteen elements that enter into plant life, and that some of these are more needed than ever is proved by the presence of bags at railway depots, in the fields and everywhere in the country marked "nitrate of soda" or "phosphate." Though the farmer has found out the use of these, he must not ignore home resources. In these days of commercial fertilizers the average farmer is a victim of fad, so that he buys himself poor. Commercial fertilizers are too often the adjuncts of lazy farmers. It is easier to buy \$20 worth from the manufacturer than to realize the same amount at home by cultivation and good management. One overlooks the fact that every season there are moved into the cellar several tons of essential elements. Plant food was ever at hand in the air and in the soil, and cultivation made plant food available. There were 1,126 brands and 128 manufacturers registered at the station; no other trade was carried on such extravagant lines; no other trade could stand the expensive mode of selling. Who pays the bill? Why, the farmer; every time the New York farmer paid more than any one else.

### New Fruits.

J. H. Hale, Glastonbury, Conn., handled this subject in his usual racy manner. He said that profits usually come from new fruits. He thought that in Japan plums we have now a race that will be profitable. They differ from the European, being hardy in the bud, more so than the peach. The skins are thick and the fruit is handsome. Burbank, Yellow Jacket (or Shabo) and Abundance he placed in order of merit. Nor-

man, a yellow flesh, needs experimenting with. The Wixon, he thought, was all right, but perhaps it bloomed rather early. Chestnuts.

Mr. Hale thought these would claim the attention of fruit growers from now on. Paragon, Ridgeley, Numbo and early Reliance were given as a selection.

### Apples.

With present prices it was hardly safe to mention these. Eighteen hundred and ninety-six was the red-letter year for big crops and low prices. The outcome of the abundance had been that new markets had been opened up and towns that had never seen apples before in car loads had done so this last season. Southern towns especially, and that meant a new trade for the future. In new apples he would only mention one and that was perhaps forty years old—Sutton's Beauty—a lustrous, clean tree, profuse bearer, color of fruit good and flesh rich. Wealthy was favorably spoken of. With York Imperial he had had no experience. In reply to a question, had he not overlooked a good plum, the Hale, the speaker said that was a good one or he would not have put his name to it.

### Peaches.

The north China strain of these were the most hardy, and everything hinged upon the hardness of buds. Elberta was a very hardy kind, and could be recommended. Sneed, Triumph and Greensboro were recommended; the latter for appearance only.

He did not believe in late peaches, but Fox, Seedling and Salway would fill the bill.

### Small Fruit.

The Kansas Black Cap is vigorous and bears enormously. In reds the Loudon was an excellent berry, and better than the Cuthbert, owing to the smaller cup, which enables it to carry well. Maori is a handsome strawberry, bears well, a bright color and catches the eye; Isabel good, and, perhaps, best of all was the Clyde.

### Beautiful Flowers.

For "beautiful flowers in many lands" the president took his hearers to Egypt to see the Lotus Lily, to Palestine for the Cyclamen, where it covers the hill sides as a carpet; then into Syria to see the Damascus rose, next to Bulgaria and the fields of roses whence the attar of roses is obtained. In succession he journeyed to Greece, where the Banksian rose grows over the tops of houses sixty and more feet in height; Italy, Switzerland and the Alps were next described. In England window and cottage gardening was carried out to a greater perfection than in any part of the wide world. From all his travels he concluded that the homes of the common people of England presented the most handsome appearance.

### Thinning Fruit.

Professor Beach spoke at considerable length on this subject, and amply demonstrated that thinning will be imperative with the grower of the future. Quoting from experiments at Geneva and elsewhere, the fruit had been of a better color and of greater size, and the proportion of No. 1 reduced to a minimum, with a greater chance of an annual crop.

### Spraying.

A. Wood, Carlton Hill, Orleans County, spoke upon this subject. A full report of his experiences was given by us on page 67 for the year 1895. His experience of 1896 was added. Finding such excellent results from spraying, Mr. Wood now has a steam sprayer to do the work. This last season he sold his crop of apples, 2,700 barrels, to the same buyer who bought them before, and realized more than \$1 a barrel, while in his section 140 carloads of apples had been sold at from 10 cents to 20 cents per barrel.

### Shrinkage of Apples.

G. T. Powell said it was hardly understood among apple men how great was the loss from this source, especially to foreign shippers. Mr. Wood had demonstrated that by spraying he had succeeded in producing such perfect fruit that he had no shrinkage whatsoever. His own experience was that when he first began to ship to England he nearly always made a loss through shrinkage and could find no way of stopping it. However, after persistent spraying he had

succeeded in reducing the loss from five barrels in thirty-five down to one-half of one per cent., and this out of a lot of 1,500 barrels.

#### Marketing.

D. L. Wygant went into the subject in a most exhaustive manner. The discussion which followed was of the most lively description. J. H. Hale championed the cause of the commission men, saying the talk about dishonest commission men is all nonsense. There were as many dishonest fruit growers as commission men. One was dishonest because of ignorance, the other out of pure deviltry. There are good men in the commission business; hunt them out and stick to them. When you make up your mind to try another market, don't run away because you make a loss. The first week he shipped Georgia peaches to Boston he lost every day. They did not want his fruit, but he stuck to it till they did. Then they took ten cars, with 1,000 crates in a car, at \$3.50, when at first they only paid him \$1.

Mr. Wygant's paper will be published in full by American Gardening.

#### Other Matters.

Samuel Henshaw read a valuable paper on the principles of landscape gardening; Professor Voorhees discussed cultivation; Professor Roberts gave as a motto for the farmer, "Keep the plow hot." Stereopticon lectures were given by Dr. Halstead and Professor Lowe respectively on fungous disease and new insect pests.

Standing committees of five members each were appointed as follows:

Vegetables—C. L. Allen, Floral Park; E. Van Allen, Delmar; James E. Rice, Yorktown; H. L. Beadle, West Cambridge; Nat Foster, Riverhead.

Insects—F. A. Sirtine, Jamaica; L. L. Morrell, Kinderhook; S. B. Huested, Blauvelt; H. C. Tillson, Highland; P. Van Schaack, Coxsack.

Diseases—F. C. Stewart, Jamaica; P. W. King, Athens; F. A. Taber, Poughkeepsie; L. E. Covert, Clintondale; Edwin Barnes, Middlehope.

Legislation—E. A. Briggs, Poughkeepsie; Ira D. Kerr, Catskill; A. W. Williams, Highland; J. R. Cornell, Newburg; Jesse Van Ness, East Greenbush.

Transportation and Commission—H. W. Collingwood, "Rural New Yorker"; G. S. Clark, Milton; J. S. Horsford, Kinderhook; W. H. Hart, Poughkeepsie; representative of Hudson Valley Fruit Farm, Walden.

Fruits—E. G. Fowler, Port Jervis; G. T. Powell, Ghent; J. R. Clark, Milton; Dr. F. M. Hexamer, "American Agriculturist"; W. D. Barnes, Middlehope.

Flowers—J. W. Withers, "American Gardening"; F. Contant, Highland; W. G. Saltford, Poughkeepsie; F. R. Pierson, Tarrytown; G. Smith, East Greenbush.

County Committees are as follows: Richmond—S. Henshaw, West New Brighton, S. I. Albany—J. Hilton, New Scotland; James Houck, Albany. Rensselaer—Jesse Van Ness, East Greenbush; J. D. Carpenter, Albany; A. Cowee, Berlin. Green—P. W. Jones, Coxsack. Washington—J. W. Duskee, Sandy Hill; H. L. Beadle, West Cambridge. Saratoga—W. J. Covert, Charleston; H. H. Tourtellot, Clifton Park. New York—Dr. F. M. Hexamer, New York; D. M. Wygant, corner Duane and Washington streets, New York city; H. D. Collingwood, New York city. Orange—W. D. Barnes, Middlehope; C. W. Clark, Grayward; S. L. Moffat, Washingtonville. Columbia—G. T. Powell, Ghent; Elias Miller, Germantown; W. H. Harrison, New Lebanon. Westchester—J. E. Rice, Yorktown; S. Underhill, Croton-on-Hudson; N. Aclair, Sing Sing. Dutchess—H. W. Hart, Poughkeepsie; Floyd Quick, Fishkill; Henry Lewis, Madeline. Suffolk—Nat Foster, Riverhead. Queens—N. Haddock, Queens; H. Hicks, Westbury. Rockland—S. B. Huested, Blauvelt. Ulster—A. Williams, Highland; S. Haviland, Marlboro; C. A. Harcourt, Clintondale.

Where the three members are not named, it will be the duty of the chairman of that county to select two others to serve with him.

**Floral Pictures.**—A new serial which is being issued by Frederick Warne & Co., New York, should find a number of readers among garden amateurs and flower lovers generally. The work will be complete in four quarterly volumes, cloth, gilt top, medium 8vo. Each will contain 78 full page colored plates of popular garden favorites. General cultural directions are given by W. Watson of Kew, which will have to be in some degree discounted by readers here.

## The Fruit Garden.

**Peach Pruning.**—This can now be done in some sections where the flower buds are growing and can at a glance be distinguished from the wood buds. In old trees the fruit is produced on short spurs, or rather stubby wood growth, but mainly on the vigorous wood of last summer, from which only first-class fruit can be had. Therefore a yearly healthy growth is necessary, which growth, when pruning is done, must be cut so that a portion will produce more such wood for the following year, and at the same time leave enough flower buds for fruit this year. Before pruning we notice that the lower buds on the young shoots are not so prominent as those toward the top, and instead of being two or three together there is often but one bud. Take out any dead or dry looking wood, then cut off about one-third of the shoot on which you expect fruit, cutting to a wood bud. Do this evenly all over the tree. Next cut back to one of the single wood buds enough shoots to produce wood for fruiting next year. All small and surplus shoots should be cut clean out. These directions apply in the main to old trees in full bearing.

Young peach trees will need severe treatment at first. If you buy one-year-old trees (which are the best to begin with) they will be three to five feet long, with a few side shoots near the top. Plant them carefully and cut them to twelve, or, at most, eighteen inches from the ground.

FIG. 66.—THE TWO KINDS OF BUD.

These stumps will produce three to six shoots four to six feet long by autumn, and possibly a few others one and a half to three feet in length. In the spring it will be seen there are no side shoots on the stronger growths for at least two or three feet from the bottom, but many near the top. The amateur would fain shorten these side shoots only, and once more a stout heart is required to cut the main shoot back to the top of the two or three foot portion, leaving no side shoots above. There are generally some small shoots below to shorten back (as in the older trees), which will possibly ripen a few fruits. Keep the center open and aim, by pruning, to be able to gather half the fruit without a step ladder for the next ten years.

**Peach Buds.**—The difference is very marked in early spring, the flower buds being cold, round and turgid, whilst the wood buds are pointed, thin or flattened, especially when between two flower buds.

**Nectarines.**—The treatment for these is similar to that for the peach. The growth of the nectarine is generally stronger, however, and is inclined to give more small shoots nearer the base, thus making a more symmetrical tree.

**Apricots** fruit on the young wood of last year, which should, therefore, be shortened, as in the peach. Fruit is also borne on spurs made on the two-year-old wood. The flower and wood buds are not so readily distinguished as they are in the peach and nectarine until later in the season.

Thorough cultivation is necessary and will go a good way toward saving manure and warding off disease. We hear a

good deal about wood ashes for fruit trees. There can be such a thing as too much of this for peaches and not enough good barn-yard manure.

**Grafting.**—With few exceptions this can be done from now until the leaves are started (if you have dormant scions).

**Raspberries, Blackberries, etc.,** which are covered should be uncovered as early as the weather will permit, selecting a mild, cloudy day for the job.

Grape vines will need the same attention as advised for raspberries, etc.

J. HOLLOWAY, L. I.

## The Vegetable Garden.

**Early Peas.**—In favorable locations a sowing of Alaska peas may now be made. We always find them satisfactory for first crops.

**Broad Beans.**—These are as hardy as peas, and if planted in rich soil as early as the ground can be worked, pods can be gathered before the heat of summer, after which time they frequently become infested with black aphids.

**Onion Sets.**—An early planting of these should be made as soon as possible for early use. Follow up by other plantings about ten days later.

**Cos Lettuce.**—The Trianon Cos is a deservedly popular lettuce with all those who have given it a fair trial, many epicures preferring it to all others whenever it is possible to procure it. It is not a good hot weather variety and is more satisfactory in early summer and early fall. Seeds should now be sown in the hot bed, the seedlings transplanted into the open ground as soon as large enough, having the ground first thoroughly enriched. This lettuce requires moisture and good cultivation.

**Cucumbers and Melons.**—These should now be started for early crop. A good plan is to have four or five seeds pressed into small pieces of sod and placed in the hot bed, the whole covered up with half an inch good loam. In this way they transplant readily. Plants may also be similarly grown in four-inch pots.

**Brussels Sprouts.**—These are always relished in the fall and make an excellent variety for the table. If seeds are not started quite early it will be October before the crop is fit for use. A sowing should now be made as for cabbage, and transplanted as soon as ready, another sowing to be made later in the open border for succession. In this way sprouts may be had from September till Christmas.

W. M. EDWARDS.

## Chrysanthemums.

**Bench Culture.**—It is always better to grow a separate batch of plants to propagate from for this work. Cuttings can, of course, be obtained in due season by pinching plants intended for specimens, but it is better to plant out now a batch of young plants a foot apart in a bed, keeping them airy and cool. These will, after being stopped a few times, furnish an abundance of healthy cuttings by the end of May. The bench system is a simple and economical one, but perhaps the best finished blooms come from pot grown plants. With the roots confined the plants can be fed more heavily, and a deeper, heavier flower will result.

**Chrysanthemums from seed** is a very interesting experiment, and there is always the bare (almost threadbare though) possibility of raising a bonanza. "Things are not what they seem" is always true of your new seedling. Sow the seed now in a flat in nice light soil and keep warm till it germinates, when the young plants can be pricked out and gradually hardened off.

**Plants for Spring Flowering.**—A batch of J. H. Troy, an early white variety, struck last November, is showing bud with us, and looks so well as to certainly justify a larger employment of this and other varieties for a similar purpose next season.

**General Attention.**—Never let your young plants get potbound, and, above all, keep things unpleasant for the black fly.

Madison, N. J.

C. TOTTY.

## Orchids at Trenton, N. J.

The showy and popular *Cattleya Trianae* in all its varying forms is enriching our collections with its glowing colored blossoms, and wherever orchids are grown at all it is represented in quantities, being one of the easiest to grow, free to flower and inexpensive. There are few *Cattleyas* that exhibit such a wide range of variation as *C. Trianae*, but the absolutely pure white form remains still a valuable plant, notwithstanding that thousands of the type have been imported.

In Mr. Charles G. Roebling's collection a specimen of *C. T. alba* may be seen, undoubtedly the finest in the country and probably in cultivation; it blooms profusely and is a grand variety, the individual blossom measuring seven inches in diameter, round and of exquisite shape, the petals three inches in width, finely fringed, the broad open lip measuring 2½ inches, with a rich yellow throat.

The most extraordinary *Cattleya* now in flower here is *C. Trianae* var. *Roeblingiana*. This is a white variety, with very broad sepals and fine round petals, the latter measuring 6½ inches in diameter, with a pleasing undulation. The labellum, however, has a coloring of deep violet, which we have never before observed in any *Trianae*, the throat bright golden yellow. The purity of its sepals and petals and the unusual shade on the labellum affords a charming combination, making it a variety much cherished by the fortunate possessor. The plant was divided last season and a portion was recently forwarded in bud to the Royal Horticultural Society in London, but unfortunately the plant suffered in transit. Another charming variety in flower was *C. T. Emily Roebling*, with blooms seven inches across, petals three inches in width, snow white, finely frilled, labellum large and open, with strong magenta veins and a clear white border. A beautiful variety of *C. T. delicata* had a very large flower, and although not so perfect in shape it measured eight inches across. The long petals were pure white, drooping and surrounding the large labellum, the latter being suffused with a clear pink. Among the brighter varieties *C. T. Dodgsonii* was well flowered; its pure white sepals and petals and brilliant crimson labellum were exceptionally fine, the individual flower measuring eight inches across. One of the very largest and brightest colored varieties well worthy of a varietal name, had enormous flowers, surpassing all that had hitherto bloomed here, the sepals measured 1½ inches in width and petals over four inches, the labellum fully two inches across, with a blotch of vivid deep magenta and a superb frill. There are scores of fine varieties here, and when all are flowering they amply repay the visitor for his journey.

A few choice *Cypripediums* were in flower, including a group of very interesting *C. insignis montanum*, each plant selected for its distinct variations. The most striking plant in bloom among the hybrids was *C. Loeanum Clinkaberryanum*, named in honor of the grower in charge, and who well merits the compliment for the excellent condition of so large a collection. This is the largest form of all the *Laeanums*. The dorsal sepal is over 3 inches across, perfectly round, and never recurves with age, of a very stout substance, having a blotch of olive green at the base, thickly studded with light purple spots, which do not spread, leaving a broad snow white margin, the petals are unusually short and broad, of a vivid olive green, with rich brown at the base, the lip is very large, shining brown, with darker venations. There were several distinct hybrids in flower obtained from *C. hirsutissimum*, the finest being *C. media superbum*, obtained from the former, and *C. Spicerianum magnificum*, the result is a flower of pleasing shape, the dorsal sepal suffused with a rosy purple shade and numerous spots, the whole surface is pubescent, the petals are drooping, ciliated, with purple apices, the staminate shiny purple, surrounded with a white margin. The lip is of a reddish brown shade. *C. Alcides superbum* is full of delicate tints obtained from *C. insignis* and *hirsutissimum*, the dorsal sepal having a broad margin of pure white, and base pea green, with a few irregular lines of

purple spots, the petals are finely ciliated, rose at the apices with a few brown spots, the labellum covered with short hairs. This is one of the most desirable of any *hirsutissimum* cross yet raised. *C. Germanianum superbum* is a cross between *C. villosum* and *C. hirsutissimum*, it is a giant flower, measuring 7 inches across, with shining purple-tipped petals, the basal portion covered with spots, the edges finely undulated, the dorsal sepal deep blackish purple, with light olive green border, the lip is unusually long and covered with numerous hairs. *C. Godseffianum* is a cross between *C. Boxallii* and *C. hirsutissimum*. The result is a very interesting flower full of detail, the dorsal sepal blackish purple surrounded with small spots and an olive green border, petals very brilliant with deep purple apices, studded at the base with blackish purple, pouch fine rosy purple.

There were many other interesting things in flower, which, to enumerate here would be encroaching on your valuable space. The seedling Orchids, which are counted here by the thousands, are alone worth the journey, and it is here that seedling *Vandas* have been successfully raised, it would be interesting to know if any of your readers have been as fortunate. They are represented by several very healthy looking and promising plants. A. DIMMOCK.

## Making a Hot Pit.

On page 51 of this volume is described a hotbed, which to me has suggested an improvement. Up here in Minnesota hot bed making in February is not altogether pleasant and not always safe. During the past week we have had as much as 50 degrees of frost, and hotbeds, unless very well protected, are a little bit risky. The illustration on page 51 has suggested an idea, which though I have never tried nor seen in use, seems very practical and affords a lasting and reliable heat, namely, the employment of steam pipes in place of the manure. Where I am situated steam can be had from a central plant, and I was thinking it would be a capital thing to run a section of frames, using steam pipes as the source of heat. By this method the frames could be used all winter; and very little heat would be required, as the pipes would be boxed in perfectly airtight, the heat radiating through the slatted top, on which the soil of the bed rests. Considering the large amount of labor necessary in preparing manure, the value of which lasts only a short time, this method would seem to far surpass the old way. Promising as this scheme appears, it may still have its drawbacks, and I would like to know if any one has ever tried it, and if so, will he tell us if there be any advantages over the manure method.

L., Minnesota.

—We see no reason why steam, or hot water heat, should not be employed. Indeed, such was long ago used in European gardens. Once fitted up, labor is much reduced, but special attention with regard to watering and maintaining a proper atmosphere becomes a necessity. Manure and pipe heats will not combine.—Ed.

**Grafting Grapes.**—In nursery row we cut the seedling or young tree or vine off at surface of ground and shape top like a wedge, and then make an upward cut in the cion about one-third its length from the lower end, and slip the cion on the wedge-like top of the root or stump. Press moist soil around the joint and cover the graft with loose soil until buds swell, when the soil should be partly removed. Grapes should be grafted about the first of March. The cions can be cut at the same time or any time in winter and buried in moist soil until used. Any kind of trees, vines, or plants can be grafted this way without using any kind of wax or strings.—E. W. KIRKPATRICK, in the Texas Farm and Ranch.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send the price to the Publishers.

## March of Progress in Small Fruits.

For years the improvement in small fruit varieties has been going on, until we find but little demand for those which were standard some twenty years ago. The object among originators seems not so much to find a variety adapted to meet the demands of the entire country but rather to obtain varieties to meet certain requirements. A raspberry may be adapted to a certain section for canning or evaporating purposes, but not be at all fit to use one thousand miles away for market purposes. The juice makers have found the old Wilson and gypsy strawberries the best for making fruit juices yet introduced. But the grower will not in many instances find either of these profitable, at least in most localities. And so it goes. The fruit grower of to-day will make more money by finding that certain variety adapted to his wants than by taking somebody else's advice and cultivating one that is a general success.

Take the Beeder Wood strawberry. I am told by a grower near New York city that it is one of his best; here it would be utter folly to plant it. A nearby friend has no success with Greenville, but another grower is so well pleased with it that he intends to plant ten acres this spring. For years the Wilson was almost the only variety grown, not only here but in many other localities. I doubt if a plant of it can now be found anywhere in this section, unless it be in some nursery. It will soon be the same with the Crescent, and many people have dropped Haverland, once a most desirable variety.

Fields of from twenty-five to fifty acres of Cuthbert raspberries were once the rule here, but new varieties come on and root it out. One large grower has entirely discarded it for Miller, and others are acting similarly. Turner and Brandywine were popular not many years ago, and the latter was one of the first ever grown hereabouts, but both are back numbers now, as is also Thompson.

The old Wilson blackberry seems to hold its own, but has defects, such as winter killing. Early Harvest is planted and a number of new varieties are being tested.

The Lucretia dewberry has given excellent results and is being largely planted; net returns of from \$90 to \$100 per acre last season have stimulated the demand for plants, and when we consider its size of fruit and productiveness, together with its early ripening, the reason for extensive planting is evident.

The strawberry-raspberry will never prove of any commercial value; but it may be well to keep an eye on the new Logan berry, for it really did produce some wonderful fruit last season, ripening with the earliest raspberries, fine of flavor and large in size.

The Golden mayberries have not fruited here, and an opinion as to their value would be mere guesswork; the plants so far do not seem to be at all hardy. The wineberry has not proven of any value, either.

Our trial grounds have a lot of new varieties of fruits that should show fruit this season. There are also some new kinds of fruits, so that before the fall of '97 we hope to be able to inform your readers in regard to many of the recent introductions.

CHARLES WRIGHT, Delaware.

Of all the nerve-tonics—bromos, celeries or nervines—your doctor will tell you that the Hypophosphites are best understood. So thoroughly related is the nervous system to disease that some physicians prescribe Hypophosphites alone in the early stages of Consumption. Scott's Emulsion is Cod-liver Oil, emulsified, with the Hypophosphites, happily blended. The result of its use is greater strength and activity of the brain, the spinal cord and the nerves.

## Thirteen Lovely Roses

FOR ONLY 50 CENTS

All will Bloom Abundantly this Summer.

For only 50 cents (in silver or stamps) we will send by mail, postpaid, 13 Everblooming and Tea Roses, no two alike, labeled, and strong plants from 2 1/2 inch pots. Collection contains such valuable sorts as Virginia, F. Kruger, Bride, C. Mermet, Empress of China, Snow Flake, Red Pet, Agrippina, Beauty Inconstant, Safrano, Perle des Jardins, etc.

For 50 cents we will mail, postpaid, and labeled, any of the following collections:

- 13 Single Geraniums,
- 13 Double Geraniums,
- 13 Single and Double Geraniums,
- 13 Carnations,
- 25 Giant Pansies,
- 13 Double Violets, 4 Sorts,
- 10 White Everblooming Roses, for Cemetery,
- 10 Dahlias,
- 10 Rex Begonias,
- 10 Flowering Begonias,
- 13 Fuchsias,
- 13 Coleus,
- 13 Chrysanthemums.

Our Illustrated and Descriptive Catalogue of Everything for Garden and Greenhouse, New and Rare Roses, Chrysanthemums, Dahlias, House and Bedding Plants, will be mailed free upon application. Send for it to-day. We guarantee satisfaction.

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

Eastern N. Y. Horticulturists. THE horticulturists of Eastern New York have every reason to be proud of the well attended and enthusiastic meeting held at Poughkeepsie on Thursday and Friday of last week. The unanimous and expressed opinion of eminent horticulturists present was that never before had such a successful and profitable meeting been held in the eastern portion of the State. Nearly 500 people attended the different sessions, and more than 160 members were enrolled. Considering that from the inception of the Society till now is barely two months, and that this was the first general meeting, 160 members is a very remarkable start and augurs well for the future.

The Society has been exceedingly fortunate in its selection of a president, Hon. James Wood, of Mount Kisco. His cheery presence, skill as a speaker, and tact in leading a gathering, makes him a very desirable chairman.

The eleven speakers who at intervals addressed the meetings were perhaps the strongest combination intellectually that it was possible to get together; and the profound attention given them by the audience showed that their teachings were acceptable. The aptness of the questions which followed at the close of each address proved the need of such a

society, and how the eastern man was tully as keen in his search for knowledge as his hitherto more favored western brother.

The proposal to change the name to Eastern New York was wise, and will raise the dignity of the new society to that of the western society referred to. While the name of the Hudson is dear to the hearts of many, and the sentiment is but natural, nevertheless there are times when local sympathies and pride have to be put in abeyance, and this is one of such occasions. The name Hudson Valley is too local and suggests limits to the usefulness of the society, limits which are not its aim, for it has declared in favor of helping the interests of horticulture in all the adjoining 18 counties, including Staten Island and Long Island. But possibly, owing to the local bearing of the name and the possible preponderating influence of fruit growers, Putnam Co. and Suffolk Co. failed to send a single representative; Richmond Co. only one; Kings Co. none; and Queens Co. only two. Thus the great vegetable growing interest was but poorly represented, and it is to be hoped that the standing committee on vegetables will bestir themselves on behalf of that important branch of horticulture, so that there may be a strong union of all interests, that in case of appeals to transportation companies, and in matters which may come before the Legislature, the whole cause will be strengthened, and a greater assurance of victory obtained. Union is strength!

An Interesting Problem. "WHY is the Rose Mme. Ferdinand Jamain called American Beauty, and why did Geo. Bancroft give it such a name?" queries a correspondent. First of all, why does our querist ask the question in that form? Is it proved beyond question that American Beauty is absolutely identical with Mme. Ferdinand Jamain? If such be the case, then someone willfully misled the public, or else the change was done in ignorance. But, on the other hand, it is claimed that the American Beauty is distinct from the French variety named, and that such has been proved by the importation of stock both ways. There seems no reason why the existing Rose should not be a form or climatic variant of Mme. Ferdinand Jamain. One thing, at all events, is certain, that the men who had to do with the introduction are honorable men, and sent out American Beauty in good faith.

The history of the Rose in Geo. Bancroft's greenhouses is not quite clear; we only get to know anything about it from the greenhouses of Field Bros., who successfully grew, and propagated it. And J. H. Small & Sons, of Washington, D. C., somewhere about 1882, saw merit in the blooms, and began to use them in their choicest decorations. At that time the Rose was condemned by many

growers as useless, and others imported plants of Mme. Ferdinand Jamain, so as to get stock, but failed to produce the same article as the Messrs. Field had. To-day American Beauty heads the list of American Roses, and as such is sold in Europe, being recognized as distinct. American Rose growers wishing to put in several houses of American Beauty do not send to Europe for Mme. Ferdinand Jamain.

The possibility of there being two different seedlings—that is, so far as their origin is concerned—and having different constitutions, yet producing flowers that are to all intents and purposes identical, is not to be questioned; and such an occurrence would explain the point at issue. Or, again, one individual plant of a given variety may so adapt itself to new conditions as to be the starting point in the development of a constitutionally distinct form, which in all other respects will retain the appearances and character of the type. The tendency to variation is present in all plants, and we see no reason why this should not manifest itself in the form of a climatic variant, especially as the best efforts of nature are put forth to aid in the perpetuation of life by progeny, and it is evident in the case before us that the popular American Rose is better adapted to the vicissitudes of the American climate than is its French twin sister.

An analogous case may be pointed in the Bartlett pear, which is our prototype of the, in England, well known Williams.

Then again, as has been lately pointed out in these columns, English and American varieties of potato have decided individualities, not only in their adaptation or otherwise to the other's climate, but in flavor, which is so decided as to call forth remarks from persons who are not concerned in gardening matters, yet both had the same starting point, but the lines of development are divergent owing to adaptation to climate.

Botanists fully recognize "geographical forms" of one and the same species, and name them distinctively, as the features are as marked, and as permanent as any feature in a living body can be, and here may be seen perhaps the initial step in the development of new species, a matter with which the gardener is often brought face to face, though he does not realize it; yes, indeed the botanist could get much from him, and by studying his works in the creating and fixing of a new race or strain of garden plant or vegetable, learn much on a matter of absorbing interest.

## Inspection of Nursery Stock.

A bill to provide for the inspection of nursery stock of all kinds so as to ensure freedom from insects and fungous diseases, was lately introduced into Congress by Mr. Swanson, of Virginia. Its provisions are practically those which were adopted by the convention of delegates as reported in our last issue. The bill was referred to the Committee on Agriculture.

## Lawns and Potash.

Just a few words in reply to Mr. Gomersall's comments on my remarks in a previous issue of "American Gardening."

Mr. Gomersall says I did not state what quantity of ashes to employ. I considered the mode of operation which I stated, namely, that of distributing, by an ordinary fertilizing machine, or by hand, was accurate enough for general purposes. I have used wood ashes extensively and have tested them in various ways.

In loading the fertilizing machine from the wagons, which are placed at convenient intervals in the field or lawn, it is reasonable to expect that considerable will fall on the grass just at these spots. Sometimes the grass is smothered with the ashes. The heaps thus formed are knocked aside by a shovel, yet I have not seen any ill result; on the contrary, a more dense growth, and perhaps a little more density of white clover.

Three weeks ago I measured off a square of six feet, and on that square I put fifteen pounds of Canada wood ashes (of which I am writing). I have not seen any ill result. I did not spread it evenly, but as a shovel might spread it—irregularly.

I do not advocate putting on ashes when the grass is in a growing state. This season I will use forty tons. It would take a long time to put this quantity on in pepper-box fashion.

I would not have again taken up the subject, but I do not wish Mr. Gomersall to think me discourteous. I agree with T. Harrison when he says: "Why not give a good manuring when at it?" But there is such a thing as too much humus in the soil (that is, for a good lawn); it causes the grass to grow too coarse. It is not rankness of grass we want, but, rather, density and softness. Too much humus puts me in mind of a pig I saw that was fattened principally on milk. One morning it lay in the pen, not able to get up on its feet—the backbone was not fit to carry the flesh. Had the pig got proper food to make bone it would have been all right, though it might not have fattened so rapidly.

A change of diet is as beneficial to the vegetable as it is to the animal, and coarseness to a certain extent is to be avoided in both. JOHN SHORE.

## Manure for Roses.

Mr. Miller, the rose grower at Messrs. Strauss' establishment, Washington, D. C., inaugurated a series of experiments last summer, with the view of determining the best food for roses. Most of the space in two of the houses is devoted to these experiments. Mr. Miller is evidently thoroughly familiar with chemistry, as applied to horticulture. However, he says he wouldn't care if there was no other than cow manure to be had so far as the feeding of roses is concerned. Mr. Miller has kept a careful record of the cut from each batch of roses grown in the different manures and soils. There is also an experiment on a small scale, dealing with the firming of the soil around the bushes when planting. Two lots, side by side, didn't show any difference in the growth, yet one of them was planted according to the orthodox method of firming the soil, the other was planted as loosely as possible.

## CAN DO MANY THINGS NOW.

I have been a reader of American Gardening through its various changes since '83, and feel that I could not do without it now. It is to me a mine of useful information, and from it I have learned to grow many things successfully.

S. W. G. P., Massachusetts.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Ashes for Lawns.**—In your issue of Feb. 20 Mr. Gomersall recommends use of coal ashes on lawns, in cultivation of potatoes, etc. Please advise whether he means ashes of anthracite or bituminous coal, or both, and in what quantities.—J. D. HARVEY.

—Ashes of both anthracite and bituminous coal are valuable for the purpose mentioned. The ashes I have used have come from hot water boilers, hot air furnaces and stoves. The intense heat of large steam boilers usually converts the ashes into small particles of slag or clinkers, so that ashes from this source would have no value. The ashes are spread on the lawn about a quarter of an inch in thickness or less, according to the quantity of wood ashes they are known to contain. (See also note on page 180).—W. G. G.

**Vineless Sweet Potatoes.**—Professor Fisher, president of the college at Hanover in our country, sent some of my vineless sweet potatoes last year to his son in Florida, where they were grown with the best of success and to entire satisfaction, making a crop during the fearful drought and when everything else failed, this being considered something wonderful and as a table variety was unsurpassed. G. CAMERER, Madison, Jefferson Co., Ind.

**Honeysuckles.**—Referring to Honeysuckles, page 166, no mention is there made of the most profuse blooming, and most generally satisfactory, of the trailing Honeysuckles we have tried, *L. Heckrodti*, a decided improvement over *Belgica*, the "Monthly Fragrant," in the abundance of its blooms, which literally cover the plant from May 1 till late in November. Of the many Honeysuckles we have growing, this is incomparably the most free bloomer all through the season, and certainly deserves a prominent place among hardy vines. Color a little lighter than *Belgica*. We find *L. brachypoda* a troublesome weed, tender and in every way inferior to *L. Halliana*, which it closely resembles.

EDWARD TEAS, Carthage, Mo.

—An old saw says that "a prophet hath no honor in his own country," and in the same way many beautiful plants suffer unaccountable neglect of cultivation because they happen to be indigenous. For example, replying to a querist on page 166 in your issue of March 6, you mention as the best honeysuckles those from far Tartary, distant Europe and Japan, but I see no mention of one that is, well, not far from some of our houses, but is hardly ever seen in the garden. I allude to the scarlet trumpet honeysuckle, *Lonicera sempervirens*, the most brilliant and beautiful of the whole family. True, it has no fragrance, but how it atones for the lack of this charm with its vividness of coloring, beside which all the other honeysuckles appear pale and ineffective. It is wild in the woods of the Eastern States, but bring it out from semi-obscurity and give it a sunny position on wall or trellis and you have one of the brightest and most profuse blooming vines, as it grows and blooms constantly from early summer till late in fall.—A. HERINGTON, Madison, N. J.

—(Our correspondent has mistaken the purport of our previous remarks; they were as a direct answer to a specific question. We are heartily in accord with the idea of bringing the best of our native plants into proper prominence in the garden, and would that there were more done in that direction.—Ed.)

## HUGHES VIRGINIA CRAB APPLE.

From what Pennsylvania or New York nursery can I get a few young trees of this? It is a very small, juicy apple and used only for making cider.—A. J. VALENTINE, Pennsylvania.

## Private Gardeners' Mission.

BY P. O'MARA.

(Concluded from page 177.)

Mr. William Jamieson of Chestnut Hill, Pa., raised the fine chrysanthemums, *Flora Hill* and *New York*. Mr. Henry Surman of Germantown, Pa., is the raiser of *Mrs. L. C. Madeira*, *Miss Minnie Wanamaker*, *Mrs. E. W. Clark* and *Harry E. Widener*. Mr. Kenneth Finlayson, gardener to Dr. Weld, Brookline, Mass., raised *Mrs. E. B. Freeman*. Jackson Dawson, Jr., raised *Theo*, valuable as a specimen plant.

I am indebted for much of the information relating to chrysanthemums to Messrs. T. D. Hatfield, Robert Craig and Lawrence Cotter.

The Double Abutilon (*Thompsonii plena*) was raised by a gardener in 1833, employed then by John Taylor Johnson, Esq., Plainfield, N. J., but whose name, unhappily, I have been unable to obtain.

We also have professional gardeners engaged in the fascinating pursuit of raising seedling orchids. I regret being unable to give a detailed list of the work done. The late William Robinson of North Easton, Mass., did much in that line, and I will never forget the day he showed me around and modestly pointed out the plants of his own raising. Mr. George Savage of Rochester, N. Y., also succeeded in raising seedling orchids to a flowering state. Mr. Henry T. Clinkaberry of Trenton, N. J., has succeeded in obtaining many interesting crosses, and the results will be eagerly watched by all lovers of orchids.

The foregoing is, I know, far from being a complete list, but it is sufficient to show that the professional gardener has a very honorable representation in horticultural annals in this country as regards the production of new varieties, and yet when we consider the number of sorts in commerce raised by commercial florists and the number of gardeners in the country, the thought becomes conviction that the latter have not as yet done as much as they should. It is true that many of our noted hybridizers are men who were professional gardeners before they became commercial florists, and it shows that the ability was in the ranks but was not employed. It was not altogether from lack of opportunity, because the gardener has it. The talent is in the ranks to-day, and it should not be allowed to lie dormant. There is ample room outside the field of cut flower varieties. We have yet to develop a race of garden roses, garden carnations, garden chrysanthemums, varieties suited to our climate. Why wait to get them from Europe or until the commercial florist should, while looking for cut flower varieties, stumble upon some good garden sorts? The material is at hand to work upon, and the professional gardener is the man who should supply it. His widest field is in the garden, and he has no competition in it to-day. In every line of summer garden flowers there is room for improvement, and if the gardener bends his energies in that direction we will soon have American-raised varieties suited to our American climate. Rest assured that if they are produced they will soon find their way into commerce, and the raiser will profit by it both in honor and pecuniary reward. This is part of the gardener's mission.

But the gardener has a yet higher mission. It is plain that the gardener, before all others, has a mission to broaden the horticultural spirit among the people. The commercial florist does it as a matter of necessity in most cases, but a mercenary motive is too frequently charged where it does not exist. No such motive can be attributed to the gardener. He is, or should be, the executive arm of those upon whom we look as the patrons of horticulture, and if he uses the influence of his position in the proper manner they will really become so. It has been well and truly said that "gardening is the most rational of all recreations. It teaches forethought, industry and economy of time. It exerts the mind, invigorates the frame and constantly reminds us of the great God whose hand is imprinted on every leaf, and who in His bountiful goodness rewards us with the fruits of the earth. To teach the cottager to manage his garden is to lead him to happiness. To induce the higher classes to

love flowers is to find them innocent gratification and provide employment for thousands." It is the mission of the gardener to do both. One gardener I know, Mr. Richard Lewis of Barrytown, N. Y., with the generous aid of his employer, Miss Catherine Cruger, is doing this. At the little village of Annandale, N. Y., is held yearly a rose show, where the humble cottager comes and exhibits often with material supplied originally by the promoter. I remember seeing a little boy on a crutch dragging a little wagon load of plants to the show, which he had grown himself from material supplied to him. What pleasure was thus added to that little desolate life. Mr. W. M. Edwards, whom many of you remember, told me that the village people had free access to the greenhouses of Mr. R. H. Hazard at Peace Dale, R. I., where he is now, and that he, with the authority of his employer, raises young chrysanthemums and other plants for distribution among those who will take care of them and are unable to buy them. Not only that, but they are told how to take care of them.

These men undoubtedly are fulfilling their mission. It should be more general. With a love of horticulture widely distributed in a community, the constable would have less to do. The man who manages his garden is almost invariably a good citizen, and the woman who looks after her window plants and garden is always a good housewife. The New York Gardeners' Society, with the aid of the New York Florists' Club, did a noble deed last summer when they gave a free exhibition to poor children at the Newsboys' Home in New York and distributed plants and flowers among them. Never will I forget the thousands of happy child faces that summer day as they went away with a plant or two and a bunch of flowers. Many a thrill of pleasure was thus sent into joyless homes. There should be something akin to this done by every horticultural society every year. The Moderation Society of New York and the Flower and Fruit Mission do praiseworthy work in this line, and if the gardener helps them with a few flowers and plants when appealed to he will, without question, be fulfilling his mission.

Another part of the professional gardener's mission, and one that is somewhat neglected is to assume his proper place in the current horticultural literature. A glance at the horticultural papers of the present time and those of thirty or more years ago will show that the gardener is not occupying the same plane now as then. Why this should be so is more than I can tell, but the fact is that in a private discussion in any gathering of gardeners you can hear sharp criticism and keen analysis of any current subject. This shows that the ability is not wanting, but that much of it is wasted on the desert air. Do not keep your lights under a bushel. If you see anything in print that seems wrong write a correction of it. You will be adding something to the sum of human knowledge and bringing honor to yourself and your profession. If you try, it is within your power to lift horticulture to a higher plane, and in doing so you elevate yourselves. Too much cannot be said in praise of the gardeners who are or have been educating the people through the horticultural papers. William R. Smith, William McMillan, William Falconer, Jackson Dawson, G. W. Oliver, E. O. Orpet, T. D. Hatfield, H. Clinkaberry, William Turner, A. P. Meredith, W. N. Craig, William Tricker, I. L. Powell, Samuel Henshaw, James McPherson, Peter Duff, Robert M. Grey, A. D. Rose and others. There should be more, and it is a pity that much of the matter never reaches the hands of the profession they represent with so much honor. "American Gardening" devotes space specially to the gardener and invites correspondence on horticultural matters, yet the invitation is not accepted as often as it should be—more's the pity. There are hundreds of men in the profession to-day who if they would could contribute much valuable information on gardening subjects. It is time to set the ball rolling. Even if a man makes a mistake and the proper spirit is abroad, he will find some one to set him right; that brings out discussion, the truth is developed, and there

## CAMPBELL'S EARLY GRAPE

Our Marvelous New

Best and most valuable. Highest commendation from highest authorities. Hardy, healthy, vigorous, very productive. Early or late. Largest clusters, finest quality, not foxy. Seeds need not be swallowed. None genuine without our seals. We guarantee safe arrival by mail. Largest stock of Grape Vines in the World. Small Fruits. Introducer of unrivalled Red Jacket Gooseberry and Paj Durrant. Catalogue free.

GEO. S. JOSSELYN, Fredonia, New York.

## Andorra Nurseries

Specialties: Large specimen ORNAMENTAL TREES, large hardy RHODODENDRONS and AZALEAS.

2500 Norway Maples, 12 to 16 ft.; 2 to 3 in. caliper.  
5000 Sugar Maples, 12 to 16 feet; 1 1/2 to 2 1/2 inches caliper.  
800 Schwedler Purple-leaved Maple, 12 to 16 feet; 2 to 3 inches caliper.  
800 Sycamore Maple, 10 to 12 feet; 1 1/2 to 2 1/2 inches caliper.  
750 Weirs Cut-leaved Maple, 12 to 16 feet; 1 1/2 to 3 inches caliper.  
500 White flowering Horse Chestnut, 10 to 12 feet; 1 1/2 to 2 1/2 inches caliper.  
150 Purple Birch, 10 to 12 ft.; 1 1/2 to 2 1/2 in. caliper.

200 Golden Catalpa, 12 to 16 feet; 1 1/2 to 2 1/2 inches caliper.  
1200 Western Catalpa, 10 to 14 feet; 1 1/2 to 2 1/2 inches caliper.  
75 Weeping Beech, 8 to 12 ft.; 2 in. caliper.  
500 Purple Beech, 8 to 12 ft.; 1 1/2 to 2 in. caliper.  
1000 Oriental Plane, 12 to 16 feet; 1 1/2 to 2 1/2 inches caliper.  
50 Bellemea Poplar, 16 to 18 feet; 2 1/2 to 3 1/2 inches caliper.  
1500 European Linden, 10 to 12 feet; 2 to 3 inches caliper.

WILLIAM WARNER HARPER, Manager, Chestnut Hill, PHILA., PA.

Mention American Gardening when you write.

is a gain all around. It should be needless to say that every gardener should belong to a horticultural society, if there is one near him. If there is none, then he has a mission to form one. Much can be done by co-operation that the individual could not accomplish.

And now, friends, in conclusion, I only desire to say that I hope the result of my talk to you may prove of some benefit to our calling both here and elsewhere. My aim has been largely an attempt to show that the professional gardener has a higher mission than men in any other vocation connected with the soil. It is one, indeed, that cannot, in my opinion, be placed on too high a plane. I am deeply sensible of the fact that the subject I chose could have been better and more ably expounded, but that it would be entered upon more earnestly I may be pardoned for doubting. The harp of horticulture has oft been swept by abler hands, but in the words of the poet, "A theme so high should its own worth supply." There is room for a sincere apprehension that a careful consideration of such matters as I have had the honor of presenting to you this evening is needed at the present time. What I have said is, perhaps, less applicable to this body than any other in the country, because you are doing and have done valuable work on most of the lines I have touched upon. You have your society in a flourishing condition, you give exhibitions, you teach the lessons of horticulture by precept and example. Your employers are liberal patrons of horticulture, largely, I believe, through your influence. It is to be hoped that you will continue, that you will with each succeeding year surpass the efforts of former ones, and hence that you will now and in the years to come receive the thanks of the community in which you live and labor is certain. You will thus set an example for others that will be far-reaching in its influence, because as you make these rugged hillsides to bloom and bear fruit, as you wring from an inhospitable nature the treasures she would keep safe-locked within her bosom, you show the possibilities of our beloved art, and you once again prove that even "He who makes two blades of grass grow where only one grew before is a benefactor to his race." How much more then he who practices and teaches the higher branches of horticulture?

### Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

THOMPSON'S SONS, Rio Vista, Va.—Wholesale Price List of Strawberries, Grapes, etc. (Illustrated.)

We solicit for publication under this heading notes on the work being done by private gardeners, changes in appointment, and all matters of interest to horticulturists generally.

**Auction Sales.**

Tuesday, March 23.—Hardy Roses, Standard Roses, Lilacs, Hydrangeas, Nursery Stock, Spring Bulbs, at Elliott's Room, New York.

Irish Roses, General Nursery Stock, Bulbs, and Spring Plants, at Cleary's Rooms, New York.

Dwarf H. P. and Standard Roses; Azaleas, Paeonies, and Flowering Shrubs, at Gardners' Rooms, New York.

Friday, March 26.—Sales will also be held as indicated above.

**Appointments and Doings.**

Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.

At Plainfield, N. J., on Feb. 23, Michael McCarthy, aged 50, gardener to Mrs. J. H. Ackerman, was found dead at the foot of some cellar-stairs. He had fallen down, and the head was crushed by contact with the cement floor.

At Germantown, Pa., a gardener, Christopher Mooney, 40 years of age, was pruning trees in the grounds of No. 336 Manheim street, on Feb. 27. He went up a tree in order to remove a dead branch, and, falling, was instantly killed.

J. Brydon is leaving Yarmouth Port, Mass., to take charge of the new establishment of Mr. Thayer at South Lancaster, Mass. This move is by request of his former employer there, Miss Simpkins, who now resides at the new place as Mrs. Thayer. Considerable alterations are to be made, and ten new greenhouses to be erected.

Mr. R. H. Warder, Superintendent of Parks at Cincinnati, Ohio, has been badly hurt in a rear end collision on the Baltimore and Ohio road, near Loveland, Ohio, on March 5. He is progressing favorably.

Mr. William R. Wood, gardener to Dr. C. N. Hoagland, Glen Cove, N. Y., has returned from a trip to the old country. During his absence the place was in charge of John Martin, who, while gardener to August Belmont, Esq., Hempstead, N. Y., received favorable notice in American Gardening for his work there. Mr. Martin is now looking for a head gardener's position.

Mr. James Scott, until lately gardener to E. T. Butler, Esq., of Totenville, S. I., as gardener to H. M. Johnson, Esq., of Bay Shore, L. I. Mr. Scott commenced his duties here on March 1.

Mr. Henry Wild of Brookline, Mass., succeeds Samuel J. Trepos as gardener to Mrs. A. W. Blake, Brookline, Mass.

Mr. G. Draycott, late with D. O. Mills at Mill Brae, Cal., entered upon his duties as gardener to W. H. Parson, Esq., Rye, N. Y., March 15.

Mr. A. Ingram, representing Messrs. Hugh Low &amp; Co., London, England, arrived from Europe on Saturday last, March 13.

Mr. J. J. Comont, representing James Carter &amp; Co., London, has also arrived.

Mr. Thompson, well known to readers of "American Gardening" as a writer on forcing cucumbers, lettuce, radishes and other winter vegetables, has returned from Chicago, Ill., where he had charge of a commercial vegetable growing establishment, and is now in the city looking for a similar place.

Mr. George Bisset, brother to Mr. Peter Bisset, gardener to Gardener Green Hubbard, Esq., of Twin Oaks, Washington, D. C., is now assistant gardener with Wallace Gomersall, Fishkill-on-Hudson, N. Y.

Assistant superintendent, Mr. James McCollom, of West Side Park, Paterson, N. J., has been given temporary charge of the Paterson parks, consequent on the death of superintendent McCrowe.

**Madison, N. J.**

The members of the Morris County Gardeners' and Florists' Society met in Masonic Hall on March 10, when three new members

were elected. Considerable time was spent in discussing details for the future extension and popularizing of the society, its shows and meetings, and in consequence no essay was prepared for this occasion, but Mr. C. H. Atkins made a few remarks bearing upon science in connection with horticulture. He expressed the idea that gardeners generally might greatly enhance their own knowledge, further perfect their skill and raise the status of their profession generally to a higher plane of respect in the public mind if they only utilized some of their spare moments to delve in the mines of knowledge and acquire some of those precious gems of information buried there. Indolence too often replied, "Life is too short for these things," but think of the time we waste after all, and ponder if it is not possible to acquire a great fund of useful knowledge and yet be young in years. Botany alone may be a subject for a lifetime, but would not some of the rudiments bearing on the laws of growth and the classification of plants be of material assistance to the gardener? In chemistry too we might learn much of profit that would enable us to understand better soils, their formation and how to maintain them in the highest state of fertility. Entomology has large bearings upon the work of our pro-

Other contributors were A. L. Marshall, John Shore, A. Wengerter and E. Reynolds. C. W. Ward, Queens, N. Y., gave an interesting and instructive talk upon carnations, for exhibition, and general purposes.

The horticultural section of the American Institute will hold its next meeting Tuesday, April 13, when "forcing of fruits and vegetables" will be discussed. There will be a large exhibition of the following: grapes, strawberries, tomatoes, radishes, cucumbers, mushrooms, lettuce and other forced articles, such as salads and herbs. Any one wishing to contribute any of the above is most cordially invited by the president, Dr. F. M. Hexamer, No. 52 Lafayette Place, New York city, to communicate with him.

#### Medals for Novelties.

The Society of American Florists offers its medals for novelties and the following official notice is issued:

"Three medals of gold, silver and bronze, to be awarded to the originators of new hybrids or varieties raised from seed, or the discovery and introduction of new species or varieties that are decided improvements over existing kinds. The awards to be made in accordance with the following rules:

"No award shall be made for any plant that has not been grown at least two years in this country and exhibited at least twice before some regularly recognized horticultural society, where it shall have received a first class indorsement in writing by said society. Further, that it have the indorsement in writing of three members of the Executive Committee before it shall be considered by the full Executive Board, and then only shall such award be made by a two-thirds vote of the committee, such species or variety to be shown in plant form and cut state where practicable. Not more than one medal shall be awarded in each class and not more than three in all in each year.

(Signed) "WM. J. STEWART,  
"Secretary."

Just what the foregoing notice really means can only be guessed at. We are not told by what means the novelty is to be brought before the society. In any case it is pretty certain that no medal will be awarded, since the restrictions are so rigid and exclusive. What is the sense in having the proviso of exhibition "at least twice before some regularly recognized horticultural society?" Is the S. A. F. afraid of its own opinions, that it will only give a second-handed award? What is a "regularly recognized" society? In the preamble it is stated the medals are offered to "the discovery and introduction of new species." Assuming this means "discoverer and introducer," is not this altogether too exclusive? The introducer of a novelty is rarely its discoverer; then what are the "classes" referred to in the last sentence? In short, the entire notice demands revision before it is comprehensible.

#### Obituary.

##### Henry McCrowe.

Henry McCrowe, who for the past three years had been Superintendent of Parks at Paterson, N. J., died in that city on Sunday last, March 14. He was fifty years of age. Mr. McCrowe had been in ill health for more than two years, and was incapacitated for work for the past three months.

Deceased was born at Twickenham Ferry, near London, and in his younger days was apprenticed to Velthe. He was afterward gardener to the Marquis of Bath, and worked for some time in Sanders' nurseries at St. Albans. He came to America ten years ago as gardener to J. R. Pitcher, Esq., and then went to Woodstock, Vt., where he gathered an extensive collection of orchids. Subsequently he became gardener to Mr. J. E. Brown, of Bellport, L. I. Later he did some landscape work, among which was the laying out of the grounds of Banker Lanier at Westbury, L. I. He, in partnership with J. S. Parks, commenced in the florist business at Patchogue, L. I., which he relinquished to accept the position he held at the time of his death.

Mr. McCrowe had an intimate knowledge of plants. He was superintendent of the New York Flower Shows for two successive years, a post which he filled with much acceptance. Obliging at all times, he was well liked by all the exhibitors. At the last election of officers of the New York Florists' Club he was the unsuccessful candidate for the presidency.

FIG. 67.—THE LATE HENRY MCCROWE.

fession, and should not be ignored, if we would know anything about the insect pests, ever more or less present and ready to discount our best endeavors. In all three of these subjects he had found the microscope a great aid, and advocated its more extended use by gardeners, whilst last, yet far from least, there were those long botanical names that we rolled off with great gusto when asked, but had not the faintest idea of their meaning or derivation. His object in making these remarks was to suggest lines of usefulness along which we, as members of this society, might work and help to advance each other, even to the extent of organizing classes, which could be done at a small incidental expense, well within the means of the members to bear.

#### New York.

The Gardeners' Society held its regular monthly meeting on March 13. J. A. Manda, South Orange, N. J., was elected an associate member, and as full members, J. Scott, R. Frank, E. C. Fischer, F. Thorber, F. Plumley, F. C. Schlegel. Nominated for membership, O. G. Owen and R. Astley.

#### The Carnation Exhibits.

C. Besold, Mineola, exhibited Mrs. Francis Joost (certificated) and Nero. J. N. May, Summit, N. J., put up a vase each of Maud Dean and Lily Dean; the latter received the society's certificate. A. Leslie, Westbury Station, contributed Buttercup, McGowan and Scott. Henry Weston, Hempstead, sent a seedling from Orange Blossom.

H. Molatch Bay Ridge, put up two seedlings, a white and a scarlet.

## A Woman Florist.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### FERTILITY OF EGGS.

One of the worst puzzles of the season for the poultry enthusiast is that pertaining to properly fertilized eggs for hatching. If the fowls have free range, with access to the open ground and green stuff, the eggs will be all right if the hens are running with a good cock. But in confinement there are a dozen points to be looked after. Grit, shell, charcoal, etc., are always a necessity to the general health when hens are confined, and thus, of course, always affect the question of fertility. It will not do to be without them. Still less will it do to be without a good supply of green food. There is one supply, however, which many contend is better left out during the breeding season. This is meat. I am not yet prepared to speak authoritatively on the subject, but can say that our eggs hatched remarkably well last season, and meat was fed on every alternate day.

### NEW IDEAS ABOUT RED SPIDER.

One of the most difficult insects to deal with hitherto has been the red spider. It has been generally understood that nothing but unlimited quantities of water and moisture in the atmosphere would keep it in check. I have had excellent success in using kerosene emulsion. But unless this is a real, well made emulsion it often injures the plants. A carnation expert has lately affirmed that if there is any one thing which spiders detest above all else it is fresh air; while they also resent abundant sunlight. He finds salt water a most effective spray for ousting red spider. From two to four two inch pots full of salt to three gallons of water may be safely used.

### HOW MANY EGGS NOW?

Between the conceded fair average of ten dozen a year and the 200 and more claimed by some is a wide margin for interested inquiry. But just at present even this is discounted by the deeper interest in the inquiry as to how many eggs should be laid in the cooler months. Mr. Hunter, of Farm Poultry, is brave enough to lay down an exact rule as to what should be. He says that a flock of hens ought to produce 40 per cent. of their number in December, 50 per cent. in January, 75 per cent. in the three succeeding months. That is, if one has a flock of 100 hens the average yield should be 40 eggs per day in December. The flocks that actually produce this number are proportionately very few. But it may aid discouraged ones to remember that Mr. Hunter is speaking of the ideal flock, composed largely, if not entirely, of early hatched, bright, vigorous pullets, and entirely lacking in "deadheads."

### THE DRACAENA.

One woman says that the best plant in her whole general collection during some months past has been *Dracaena terminalis*. To be sure, it has not bloomed; but it has always been handsome, well furnished with leaves to the ground, and needing very little care, while it has always furnished as bright a spot of color as most blooming plants give. In selecting a plant of this class it is good to make a personal visit to the florist's whenever practicable, in order to secure a plant satisfactorily colored.

### THE ROSE-COMBED BROWNS.

Every one who owns them takes it for granted that every one else knows that this appellation can mean nothing but the beautiful Rose-comb Brown Leghorns. They are certainly as pretty fowls as can be found; independent enough, if allowed, to forage at will, yet affectionate and dependent on their owners, and showing the utmost confidence. Plump as partridges the fully-feathered pullets closely resemble them after the first six weeks. The low, broad combs, that can give Jack Frost no hold, the round, yet long, muscular bodies bespeaking the laying constitution, the bright eye that lets no chance bug or tid-

## Woman's Writes

Believe in Woman's Writes? Of course we do. Who could help it when women write such convincing words as these: "For seven years I suffered with scrofula. I had a good physician. Every means of cure was tried in vain. At last I was told to try Ayer's Sarsaparilla, which entirely cured me after using seven bottles." —MRS. JOHN A. GENTLE, Fort Fairfield, Me., Jan. 26, 1896.

**Ayer's Sarsaparilla**  
..cures..

bit escape notice, the happy, low voiced speech each to the other, and all the time; all these show the constant layer, bred to it from generation to generation. And we know her by these whims, even though we never had a glimpse into the never-empty egg-basket.

MYRA V. NORRY.

ANY farm paper contains matter worth more than a dollar a year, if you could only separate the reliable from the unreliable. *The Rural New-Yorker* saves you this trouble and uncertainty. It is all reliable. We can send it and **AMERICAN GARDENING** both one year for \$1.80 and your money back in three months for *The Rural* if you want it.

### Business Cards.

Cards will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance; the address to be counted part of the advertisement.

**LAND DEVELOPMENT**, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. JOE FORSYTH JOHNSON, P. O. Box 1697, New York City

### GRAY HAIR MADE DARK

By a hairless Rose Wash. Also makes the hair grow. Full directions and notice for 25 cts. Mrs. A. HUNTLEY, 6215 Evans Ave., St. Louis, Mo. Mention American Gardening when you write.

**TREES At Very Low Prices.** Send now for Free Catalogue. Established 1869. 150 ACRES. **THE GEO. A. SWEET NURSERY CO.,** BOX 1591, DANVILLE, N. Y. Mention American Gardening when you write.

**1,000 Peach Trees** One year, from bud 2 to 3 ft., mostly branched, with freight prepaid to any station east of Miss. River for \$20; or 500 for \$11.50. Sample prepaid, 25c. Other sized trees proportional prices. R. S. JOHNSTON, Box 21, Stockley, Del. Mention American Gardening when you write.

### Southern Vermont Nursery

GREEN MOUNTAIN GRAPE VINES, 25 cents each. VERMONT BEAUTY PEAR TREES, 5 to 6 feet, 25 cents each. Send for Catalogue.

C. A. HINSDELL, Prop., Lock Box 459, North Bennington, Vt. Mention American Gardening when you write.

### BANANAS AND PAPAYAS

Grandest of all bedding plants, see illustration from life in *American Gardening* Feb. 27. Our original catalogue tells about the **TROPICAL ORCHARD HOUSE**, a new horticultural industry of greatest interest. Send for it. ROSE VALLEY NURSERIES, Dongola, Ill.

Mention American Gardening when you write.

## WHOLESALE MARKET REPORT

## New York.

The cut flower market is suffering from true Lenten guilness. Stock is in light supply, with demand light and prices low. Violets are very plentiful, with 50c. per 100 as the highest quotation. The average being only about 25c.

The vegetable market is cleaning up well day by day, with but little variation in prices. Southern stock has lightened up, and that which is arriving, especially lettuce, is poor quality. We understand that good stock will be ready soon, and will probably make this market about two weeks from this date.

Hot-house strawberries have become very scarce. Florida stock is plentiful, poor and cheap.

Apples remain stationary except for a very few extra fancy, which have realized outside quotations.

Cucumbers are more plentiful; No. 1 make \$1 to \$1.50.

Mushrooms are not doing so well as they did last week.

Hot-house tomatoes, 30c. per lb.

Hot-house lettuces have stiffened up considerably, and when good make a much better figure than for some time past. Good heads are worth 60c. to \$1 per dozen.

New potatoes, \$6 to \$8 per barrel.

Radishes, \$2 to \$3 per 100 bunches.

Fancy celery scarce and very valuable.

Asparagus is now good, and makes from \$3.50 to \$7.50 per dozen bunches, according to grade.

## Vegetables.

Asparagus, Ch'n. choice, per doz. bchs 00@

—Ch'n. culls, per doz. bchs.....3.00@3 50

Beets, Florida, new, per bush, crate..... 75

Cabbages, per 100.....2 00@3 50

## Strawberries.

Florida, choice, large, bright, per qt. 28@ 30

—Common to fair, per quart..... 12@ 20

## Philadelphia.

Business has been much better in this market this past week, buyers are more plentiful, and all kinds of vegetables are moving well. But there is still a scarcity of choice vegetables. Hot-house stock is still scarce. The growers around this section have evidently become disgusted at the low prices obtained during the past few seasons.

Apples are being held firm, receipts have fallen off, and a much larger quantity of second grade fruit is seen. Present prices are:

Spitzenburg, fancy, per bbl.....2 00@2 25

—Fair, per bbl.....1 40@1 75

Russets, fancy, per bbl.....1 40@1 75

Baldwins, fancy, per bbl.....1 80@2 00

—Fair to good, per bbl.....1 35@1 60

Greenings, fancy, per bbl.....1 00@1 25

Ben Davis, fair to good, per bbl.....1 25@1 40

Strawberries, Florida, are more plentiful,

and of much better quality. These have been

selling well at from 25c. to 35c. per qt.

Vegetables have not changed materially in

price or variety. There is a large demand

for new vegetables; anything that looks green

sells rapidly.

Beets, Fla., per 100 bunches.....2 00@3 00

Caulliflower, Fla., per 1/4 bbl. basket.....1 00@1 75

Cabbages, Fla., per bbl. crate.....1 00@1 25

Cucumbers, hot-house, per doz.....1 50@1 75

Celery, best grade, per doz. stalks..... 50@ 70

—Fair to good..... 30@ 40

Lettuce, Fla., 1/2 bbl. basket.....2 00@2 50

## Questions Answered.

This is a Bureau of Information, to which subscribers can apply freely for advice on any and all subjects in the field of horticulture.

In order to lessen labor, and that the Editor and his friends may understand each other, the following rules must be observed:

### Rules for Correspondents.

Questions must be concise, plainly written on one side of the paper only, and addressed INQUIRY DEPARTMENT, AMERICAN GARDENING, P. O. Box 1697, New York City.

Letters appertaining to subscriptions, or other business matters, should be directed separately; otherwise delay may follow.

The name and address of the sender is required, in addition to a nom de plume. Use a separate sheet of paper, not a scrap, for each question. Questions will be attended to without delay. If by mistake a query fails to be answered, it should be repeated.

Specimens of plants for identification must be ample; mere scraps will not do, and no notice can be taken of such.

Questions relating to insects or diseased plants should always be accompanied by specimens, packed in a tin box, and forwarded at letter postage. Always send a liberal sample.

Conditions and soils vary so infinitely that we would be pleased to have our correspondents describe theirs.

Correspondents referring to articles which have appeared in AMERICAN GARDENING should mention page and date of issue.

We cannot promise to comply with requests to answer by mail.

\*. We cannot undertake to reply by mail.

### Worms on Vines.

(Early last summer I discovered black, woolly caterpillars on my Dutchman's pipe vine. The leaves were being perforated. I applied kailbore in water, but they did not seem to mind it, so I had to catch them by hand. Late in the season they appeared again. What can I apply to vine that will kill caterpillars and not injure the vine?—G. H.)

—Spray with some arsenite, say, paris green.

### Greenhouse Management.

(My greenhouse of three-quarter span, 30x17 feet, is ventilated by five windows on the south side, each three feet long by twenty inches wide. If the sun comes out ordinarily I cannot keep the temperature below 80 degrees from 10 until 4 o'clock. The air strikes down when I open them fully. Do you think a temperature of that sort would take the chill off the cold air before it would reach the plants, supposing the temperature outside was at 20 or 25, with the air not very brisk? Would you advise me to get the patent crank? Also give me remedy for a draft from the ventilators.—SUBSCRIBER.)

—You do not say whether all fire heat has been stopped or not when the temperature is so high. If it is only brought on by sun heat but little harm can come of it; the ventilators may be opened during such time providing the wind is not blowing straight in. The extent of opening must always be according to the outside temperature and wind and the tenderness, or class, of stock within. There is no rule which can be laid down. What kind of ventilator is a question of expense and desires, also convenience, and in this last respect the improved machines now on the market are very desirable; also they allow of little or much air according to what may be needed.

### Hyacinths Not Flowering.

(I have some hyacinths which will not bloom. I potted them in good soil, mixed with a little manure, and put them in the cellar for about eight weeks. I then brought them upstairs and put them by a window, where the sun shone about five hours daily. The thermometer registered about 70 degrees during the day and about 65 degrees at night. They come up all right until they commence to show their buds, and then the buds rot off. I give them water when they need it. Will you please state the cause for this?—J. D.)

—Lack of root action. Possibly exposed to the strong light and heat before the soil was filled with roots. Very frequently the flower spike is injured while yet hidden away in the bulb; when that is so the fault is with the bulbs and not yourself.

### How to Grow Mignonette.

(My mignonette has been a failure for two years. I have planted different kinds in different parts of the garden. It comes up nicely but seems to blight. What is the matter?—GEORGE HOLMES.)

—Try a position not quite so exposed. When we had the same experience it was found that by sowing a little seed at random among other crops, letting it do just as it liked, we got good Mignonette. Possibly you may benefit in the same way.

# P. & M'S BULBS ARE BLOOMERS.

"A Flower in Every Bulb."

Plant them—See them start—Daily develop into strong, beautiful plants—And finally burst into their full glory of bloom, a sight at once refreshing and elevating. We prepay express charges. This collection will be delivered at your door promptly upon receipt of price.

READ IN MARCH 13TH ISSUE OUR UNEXCELLED

# PREMIUM OFFERS

....OF....

## Plants, Trees, Seeds, Bulbs, etc., for New Subscriptions.

Our premiums are offered with a view to interesting present subscribers to obtain us New Subscriptions, and for so doing we expect them to obtain the new subscriber and retain the premium. If the subscriber they procure wants a premium (and he doubtless will), he, in turn, should interest himself in the same way. New names sent in direct are, of course, also entitled to our premium offers.

Every premium offered by AMERICAN GARDENING in 1897 will be select and valuable, and, owing to the fact that all orders will be filled direct from growers who seek the trade of our readers, and so are making us great concessions, the premiums will, as a rule, be in themselves worth the full subscription price of the paper.

The Premiums offered are all of exceptional value; there is nothing bordering on the sensational in the various announcements, and great pains have been taken to secure offers from reliable growers and specialists. As we have previously stated, the publishers of AMERICAN GARDENING neither buy, sell, nor in any way do they trade in the stocks offered, except to mail the orders as received to the growers or dealers making the offers.

If you can place a few of our Premium Lists where they will do most good, we will be very pleased indeed to forward same on application.

### ONE YEAR FOR 10 CENTS

We send our monthly 16-page, 48 col. paper devoted to Floriculture, Home Decoration, Poultry, Household, Orchard, Garden, Floriculture, Poultry, etc., one year for 10 cents, if you send the names and addresses of six lady friends. **WOMAN'S FARM JOURNAL**, 4212 Evans Ave., Saint Louis, Mo. ## The Savannah Line

1400 Miles at Sea and a Week's Board, \$36.

For a short time the Savannah Line will sell First Cabin Tickets calling for transportation 700 miles each way, unexcelled meals and accommodations aboard steamer, transfers in Savannah, and two days' stop at choice of three first-class hotels at Savannah; in all, nearly a week's board in addition to transportation, etc., for THIRTY-SIX DOLLARS.

**Through Tickets to JACKSONVILLE, ATLANTA, and all Points South.** Steamers sail Tuesdays, Thursdays and Saturdays, from New York, and every four and five days respectively from Boston and Philadelphia, (see sailing cards.) Electric Lights kept up all night so that passengers can turn them on or off at pleasure.

**UNSURPASSED CABIN ACCOMMODATIONS, SEA SPRAY BATHS AND ALL CONVENIENCES.** Send three two-cent stamps for Savannah Line News, and beautifully illustrated book, something new, to **RICHARDSON & BARNARD**, Agents, 20 Atlantic Ave., Boston, Mass.; **M. O. HAMMOND**, Agent, Pier 18 S. W. Foot Spruce St., Philadelphia, Pa., or

## WE OFFER AMONG MANY NEW THINGS

**The Bismarck Apple**—Bears splendid fruit on 2-year grafts. A remarkable new fruit.  
**Hedysarum Munglium**—A new Mongolian Shrub of great beauty.  
**Lord Penzance's Hybrid Sweetbriars**—Worthy a place in every garden.  
**Viburnum Tomentosum**—We consider this the finest shrub grown. Very rare.  
**Picea Cancelet**—An improvement on the Blue Spruce.  
**The Weeping Spruce**.  
**Clematis Paniculata**—Without an equal as a hardy climber, 30 cts.  
**Magnolias, Japan Maples**.  
 The best stock of **Herbaceous Perennials** in the country.  
**Rhododendrons and Azaleas** at lowest prices quoted.

For all these, and full advice and plans for planting grounds and gardens, write us.

New Catalogue mailed for 10 cts.

## The Life in the Seed.

"Strike while the iron is hot" is an old adage, and a sound one; but such advice carries with it the inference that the hammer is all ready for use and that the eye of the operative is keen for the work to be done.

In the garden, too, there is a lesson to be taken from this text. It behooves the gardener to be ready for work at the right moment, and undue haste, too, is to be avoided as much as is delay. It must not be forgotten that to put seed into the ground when the latter is cold and wet, just after the winter is past, is death to the seed; but as the time moves quickly when once the ground is ready, every one ought to be prepared with the necessary supply ready for use, so as to be able to "strike while the iron is hot."

Upon our first work in the garden will depend to a large extent the ultimate success or failure of the season. But, perhaps, the one point to insist on now is the necessity of securing the supply of seeds—an important duty that is too often neglected, and not only are purchases delayed, but selection is sadly overlooked.

The value of a garden is proportionate to its yield, both as regards quantity and quality, the latter matter being the prime consideration. Good vegetables and choice flowers can only be obtained by planting the best of seeds, and these can only

be obtained from the most reliable sources. True, poor results may be had from the most carefully selected seeds, much depending upon climatic conditions or upon causes over which the gardener has no control, but under no circumstances can he get good results from poor seeds.

There is a marked difference between seeds that are grown with the greatest care, united with a thorough knowledge of the principle of selection, studied with a view to securing certain esculent property in the vegetable, or form and color in the flower, and seeds which are grown simply to sell. There is a difference in their cost—in some instances a great difference—because of the difference in the cost of production. Good seeds cannot be sold at a low price, and at the same time no gardener can afford to plant other than the very best.

In the purchase of seeds a wise system to adopt is to buy of most classes sufficient for a two or three years' supply, and if, on the maturing of the vegetable, it be found just what was wanted, the next year is secure,

and, what is of still greater importance, it is known in advance just what can be expected from the seeds planted. The next year, lay in a one year's supply and plant a few seeds of each variety sufficient for a test, and the seedsman's non-warranty clause will cause little worry.

All vine seeds, if kept cool, dark and dry, are good for at least five years and will improve rather than deterior-

FIG. 68.—KING RED RASPBERRY. (See page 221.)

ate by age. All of the brassica family, particularly turnips and cabbage, will retain their vitality equally as long. Seed of rutabaga that was twelve years old has been planted with the best possible results. Beets and carrots lose their vitality somewhat sooner, but they are absolutely good for three years. Beans are good for three years, but an advance supply of them is not as necessary, as they can be judged by appearances. The main thing here is to know the best variety, while types are of more importance with other forms. By all means have a two years' supply of cauliflower seed on hand; there is a wide difference in varieties of the cauliflower. Egg plant seed is good for three or four years, and seed three years old is even preferable to fresh seed. Lettuce is more fickle, but it is always well to keep a year's stock on hand.

Onion seed loses its vitality much sooner than do most other seeds; as a rule it is good for two years, but it is safer to rely for this seed on the seedsman. Okra is good for three years, and for this esculent as well as ornamental plant it is not a bad plan for every gardener to save his own seed when he gets a variety that just suits him. Of other seeds there is nothing to be gained by the gardener saving his own; it is easier and better to rely on the work of the regular seed grower.

Peas will not lose vitality in three years, and our experience is we get more peas and less vines from seeds two years old. Pepper seed is good for three years, but its place in the garden is a small one. Radish, more than most other garden crops, should be kept in stock after a thorough test is made of varieties. The radish is a peculiar plant; while all kinds usually grow well, some grow better than others, or, rather, some will do much better in one soil than another; after securing the best, hold on to it. Spinach always does well, and, so far as flavor goes, there is practically no difference in the varieties.

The tomato is another vegetable for seed of which the gardener can rely upon his own efforts, but before attempting to save any he should be sure he has the best for his own place. As the cost is but a trifle for a year's supply and as the seed retains its vitality for a long time, a three years' stock is not too much to have on hand at all times.

**Poisoned by Wild Plants** is a too frequent cause of death to children, and, commenting on recent instances the Philadelphia "Press" asks very particularly why our rural schools do not educate the children along such lines as would inform them of the poisonous nature of certain roots. It is within the power of all schools to explain by diagram and actual example the differences between the harmless and noxious, so that the children would be less liable to make these distressing mistakes. Such a variation from the study of natural history abstractions ought to commend itself. Apparently, however, although familiar with the evil, the school authorities have never given it serious consideration.

#### EGG YIELDS.

A close scanning of reported egg yields from every available source during the winter of '95-6, showed one somewhat common experience. The largest reported yields were often made upon a combination consisting mainly of wheat, corn, and meat. Clover was seldom mentioned, but most of the reporters forgot to say whether the hens had access to hay, clover, chaff, etc. This point would largely influence the value of the reports.

## Diseases of Forcing House Vegetables.

Bulletin 73 of the Ohio Agricultural Experiment Station is devoted to studies of some of the more common plant diseases of the forcing house and garden, especially those encountered in the culture of vegetables under glass, an industry which is assuming very considerable importance in Ohio and other Northern States. The bulletin is illustrated with several plates.

Complaints are frequently received at the Station of lettuce rot, a disease which affects the head varieties especially, when grown under glass. The Grand Rapids variety seems to suffer least. Too high temperature, especially at night, is conducive to the rot. Thorough ventilation and care in watering are the remedies suggested. Other diseases of lettuce are leaf blight, leaf perforation and downy mildew. Experience at the station and elsewhere has demonstrated that when lettuce is watered by sub-irrigation it is much less liable to these diseases than when surface watered.

Another class of diseases, affecting more especially roses, tomatoes, begonias, cucumbers and some other plants is caused by small eel-worms or nematodes, microscopic in size, which work in the roots of the plants, causing minute enlargements or galls. The symptoms of attack are stunted growth, yellowing and dropping of leaves, especially dying of the leaves at the point or lateral margins, with a scalded aspect. In roses, which are the most liable of all plants to nematode attack, the disease is often called "the yellows." Thorough

FIG. 69. TO MAKE A HEDGE QUICKLY.

steaming of the soil before planting is the most promising remedy yet discovered at the Station.

The powdery mildew of composite plants has been successfully combated upon cinerarias, when taken in time, by spraying with weak solution of potassium sulphide or copper sulphate. Probably the downy mildew of the cucumber would yield to the same treatment.

The sudden wilting of outdoor cucumbers is due to a bacterial disease, which may be carried from plant to plant by the cucumber beetle. No effectual prevention is known, but the burning of diseased plants and the destruction of the beetles are indicated.

A spot upon the leaf and fruit of cucumbers is found in the East and is likely to cause trouble to pickle growers in Ohio. Spraying with Bordeaux mixture is indicated for this disease, as well as for a new leaf-blight of the muskmelon, causing many rather large, dried spots in the leaves, followed by dying and curling under from the tips to the margins.

Tomato leaf-mold is the most common fungus disease of tomatoes grown under glass. This caused serious loss in the Station greenhouses in 1891, where it was introduced in an old plant carried over, from which it spread throughout the houses. The disease first appears as rusty brown patches on the under side of the leaves; as these patches enlarge the leaf becomes yellow, wilts and finally dies. In cases of severe attack the whole plant may perish, and in any case its growth will be seriously checked.

With leaf-mold, as with lettuce rot, thorough ventilation is required, and spraying with diluted Bordeaux mixture is indicated. Greenhouse tomatoes are subject to other forms of leaf blight and spot, some of them affecting fruit as well as foliage. All dis-

eased plants should be at once removed and burnt.

The bulletin is a report of progress in the study of plant diseases, many of them but little known, and in case of serious outbreaks of such diseases gardeners are requested to aid the Station in further study by sending samples of diseased plants to the Experiment Station at Wooster, with full description of soil, treatment, etc.

## A Handsome and Quickly Made Hedge.

Making a hedge with ordinary hedge plants requires a good many years of waiting before the full realization of one's anticipations. Many are deterred from starting hedges because of this long period of waiting. The accompanying illustration shows a "short cut" to a remarkably handsome hedge. A "form" is made of wire netting, the sides and top also being covered. Along the base on either side of this quickly growing vines are planted, which soon cover the wire with a mass of green that becomes more and more dense and beautiful each succeeding year if the proper sort of vines are used. The "proper sort" in the writer's estimation, would include our common woodbine. It is a quick grower and its foliage is remarkably handsome, both in the green state and when touched by autumn frosts. There are many other vines, however, that would answer admirably for this purpose, so that all tastes can be suited. Such a hedge needs only such annual clipping as will suffice to keep the vines growing evenly all over the wire—as thickly in one place as in another. Cedar stakes should be used and carefully set in making such a hedge, since once made and covered with a thick growth of vines, it will be inconvenient to make interior repairs, though stakes can, of course, be driven down through the netting if necessary. WEBB DONNELL.

## The Vegetable Garden.

**Radish.**—Seed may be sown in hot beds for earliest crops and also for succession in rich soil.

**Spinach.**—Sow for succession either in hot beds or warm border outside. The thick leaved is the best variety for general early use. The New Zealand variety is a valuable variety for the hot months. Seeds of these should be started in heat; germination is aided by soaking the seeds in hot water for several hours previous to sowing. Seed may also be sown outside, when the ground is dry and warm, and the crop will come in for late summer and fall use.

**Carrots.**—A sowing of Early French Forcing may be made on the earliest border as soon as the soil is dry and workable.

**Beets.**—To insure constant supply in best condition a few rows should be sown every alternate week until July 20. The last sowing should be large enough to give roots for the winter supply.

**Turnips.**—An early sowing of the Early Strap Leaf or Early Milan Turnip should now be made on ground that has been thoroughly enriched with organic manure; an application of nitrate of soda is also an advantage. As soon as germination takes place, apply dressings of soot, slacked lime or land plaster as a protection against the turnip fly.

**Horae Radish.**—This is a general favorite as a relish. An out-of-the-way corner should be selected for planting. Cuttings should be made six inches in length, from small rootlets of  $\frac{1}{4}$  to  $\frac{1}{2}$  inch in diameter. They should be cut off square at the top and sloping at the bottom, that we may be sure to plant it the right way up. It grows best in moist, rich soil. Plant three inches apart in rows eighteen inches apart. The larger roots are kept for use.

W. M. EDWARDS.

## Packing and Marketing.\*

The two questions assigned to me, that of packages and marketing of fruit, are, to my mind, vital questions, and the longer I am in the market the more their importance is impressed upon my mind, and often, indeed, am I amazed at the quantities of good stock which are spoiled in the package, packing and shipping.

It is a matter of surprise to notice how many good growers there are who do not seem to realize the first thing about the proper way of getting their goods to market or to the consumer. It is puzzling to reconcile the one fact that a man will lend his energies and his will to master the details of cultivation, with the other fact that after giving it all this attention, he will then practically sacrifice the whole of the results through want of even elementary knowledge in regard to packing, and shipping, and market requirements. Yet such is the case with far too many growers.

basket to contain exactly the same number of plums. Every piece of fruit is paper-wrapped, which is necessary from the fact that the fruit is so long in an ice car. I only speak of this to show how sharp the competition is for the consumptive trade. I fear we have been too careless in this particular, not considering the relation the consumer bears to us, and while we have been careless, our progressive Western competitors are getting our business and taking the market that belongs to us.

As to berries, and any fruit that is shipped in quarts, I would recommend the regular quart crate, that the baskets fill the crate, and not such as we sometimes see, crates in which the baskets do not come within two inches of the top and one inch of the sides and ends, with the extra space stuffed with leaves, giving the crates an ugly appearance and allowing them to upset the berries, to get bruised and soft, and oftentimes are sold for less than half of the amount saved in the difference.

greased for the occasion," which I think has been demonstrated in the grape business. I will try to convince you that our line of action has been directly opposed to the rule of success. While we have naturally largely increased the supply, we also have increased the supply about one hundred per cent. artificially by cutting down the size of the package to half the regular size and then making it twice as expensive to market. I have taken the trouble to show the loss this year alone on packages, a loss which in itself is a nice profit! There was shipped from the five counties of New York State—Dutchess, Columbia, Greene, Ulster and Orange—500,000 twenty pound crates that cost 13 cents each. Now, had they been in forty pound crates that cost the same price there would have been a saving of 250,000 crates at 13 cents each or \$32,500; cartage at 4 cents each, \$10,000; packing at 2 cents each, \$5,000, making a saving of \$47,500 alone in packages. Now, I hear some one say the small crate brings just as much as the large one. Do you believe it? Is it common sense or according to any rule of trade that a less quantity will bring as much as a greater quantity? You say "But they do." They do, because the large majority of the crates in market are small ones and they supply the trade and bring the few large ones down to their level.

You say, "Why do buyers take the small ones at such a little difference in price?" They have to do so in order to compete with their neighbor. They must have them as cheap as their neighbor or lose the trade, the producer standing all the extra expense and the middleman getting all the profits, for if he can retail a basket which cost him seven cents and make as much profit as one that cost him twice as much, he has less invested, and why should he not encourage it? It has not cost him any more, but has cost you twice as much. Now again if we had two hundred and fifty thousand crates less, with eight baskets to the crate we would require just two million less customers to consume the crop. I don't believe there is a grower or a commission merchant, or a dealer within the hearing of my voice that can say he ever sold one more crate or basket of grapes in consequence of the basket or crate being smaller, and I think you cannot help but say that the decrease in the number of crates and baskets to one half alone would make some difference in the price. Should the difference in the price be twenty cents per crate, and I have no doubt but that it would be more, it would make fifty thousand dollars, which, with the profit already spoken of in saving of crates would be about one hundred thousand dollars in all.

Every family, boarding house or hotel has a rule for meals. For lunch or dessert at dinner, it will one day be pears, another peaches and another grapes. Now to-day it is grapes. They will put on their order one basket of grapes and the dealer will send the smallest possible basket and charge all he possibly can for it, and if there is not enough grapes the family will cut them up and make them do. They would have taken a basket of five pounds just as quickly and paid the difference, and would have been better satisfied and bought another basket just as quickly for the next lunch or dinner. So it is with a man who is going to the train. He will take a basket of five pounds just as readily as one with two and a half pounds, and pay the difference in price. I cannot see any advantage of the small basket to increase the consumption of grapes, as you well know the average consumer will eat ripe Concord grapes as long as they are in sight, and with the quantity that is now grown it behooves us to keep them in front of him all the time. Is it not a fact that ever since this plan of cutting down and cutting under in the size of packages, making them as deceptive as possible, and to hold as little as possible, that our market has been drooping as compared to the time when we had the fifty pound package of six baskets sold by the pound? Is it not against all rules of business to keep increasing the supply, and, as it were, decreasing the consumption, by cutting the size of the package until now we have the price so small and the expenses so large that the grower gets

FIG. 70—STRAWBERRY CARRIE.  
(See page 271.)

Hence, I feel it is almost impossible to do them justice in the short time to consider them. I have taken the most important part of them, first, as to packages, a subject that demands immediate attention to secure a package that is most economical and will at the same time give the best results.

It seems strange that we have to look to the youngest fruit-growing State in the Union, that of California, for example in packing and methods of packing. Every package for each kind of fruit of uniform size, so that the buyer knows just the quantity each package contains and every package honestly packed. I have handled thousands of packages, and have yet to see the first one that is not honestly packed as per sample, so that I can sit in my office in New York City and order a car by wire from California, and know just what I will get. I have, indeed, often counted a crate of four baskets of plums and found each

For pears the regular half barrel is the most desirable and profitable package, as there is a large Southern shipping trade and a refrigerator trade that demands that style of packing, and the market does not lumber up as it does with baskets and all sized berry crates that are hawked around the streets by cheap vendors, which action has a tendency to affect the price of all in the market.

As to grapes, packages for these today is the greatest problem of all. A business that only a few years ago was the most profitable of all the fruit trade is now a losing one, a condition which most men to-day will say is caused by overproduction. I claim not. While over production may have caused some of it, the package has been the greatest cause of the present condition. You growers have dug the pit yourselves and, as it were, fallen into it, and the only way I can see out of it is by a long pull, a strong pull, and a pull all together; as in the violation of any rule of justice and equity between man and man in business, as Josh Billings once said, "You go down the plank as if it was

\*Paper by D. M. Wygant, commission dealer, New York, before the Eastern New York Fruit Growers meeting.

nothing and the basket itself so small that the consumer gets nothing for his money? The only ones that get any benefit are the crate maker and the retailer. Is it not a fact that the reasons I have named may be, rather than the increase of the supply, some of the causes of the present condition of our market? Some will say, "How can the reform on such a question as this be brought about?" I would say the same as Abraham Lincoln as to how he would suppress the Rebellion. Once during the darkest hours of '62, one of the Cabinet officers being very much depressed went to Mr. Lincoln, asked how he expected to suppress the rebellion. Mr. Lincoln's prompt reply was: "We have a just cause and I expect to conquer by pegging away." And so with your cause; in the line of justice and right, if you keep pegging away you are bound to succeed.

Only a few years ago it was almost impossible in large cities to get a quart of pure milk. Millions of gallons of water were sold with the milk by the unscrupulous dealer. To-day I get as pure milk in my home in the city of Brooklyn as you get direct from the cow. It has all been brought about by proper legislation and the enforcing of the law. One basket dealer told me only a few days ago that he had sold in the City of New York alone last year one million skin quarts. We all know there are no berries grown in these skin quarts, and the grow has received the blame for all. When a customer complained he was told, as in the case of the milk, "It's the farmer. The pump is the most profitable cow he has." Thus the shrewd dealer saddles all the blame on the producer and gets all the profit. I see no reason why a reputable dealer should be allowed to sell a short quart of berries more than he should a short quart of molasses; or twelve ounces for a pound of grapes, more than twelve ounces for a pound of sugar. The producer commenced by putting down the first rail and now the dealer has put down the whole bars. The standard of justice in trade of our forefathers, 16 ounces to the pound and 32 quarts to the bushel, stands to-day in everything we buy or sell, except fruit. I could hold up a basket of grapes before you to-day and there is not a man in this audience that could guess within eight ounces of what it contained. Do you, then, tell me, the crop of millions of pounds can be distributed with any degree of justice between buyer, seller and consumer by being weighed only with the hand—and then as lightly as possible by the producer and as heavy as possible by the dealer? You well know two different packers side by side from the same truck of fruit will put more or less into similarly sized baskets. Give us back the olden rule that of justice to all, a pound for a pound, and a bushel for a bushel, and go to the Legislature and make laws that will compel every producer and dealer to give a pound for a pound, whether it be sugar or fruit; and thirty-two quarts for a bushel, whether it be grain or fruit; and make the fine so heavy and enforce the law so promptly that no one will dare to offer fruit in any market by any other standard. And I would also make a law that would prohibit the manufacturer of crates or baskets from making or selling a crate or basket other than of the standard sizes.

#### Marketing.

As to the method of marketing. It is one of the most perplexing questions we have to contend with to-day, and in order that we might better understand the situation, I have ascertained the number of customers with whom we are directly in touch, within a radius of one hundred miles from this platform, counting the towns of one thousand or more inhabitants. There are four million, twenty-two thousand, nine hundred and seventy-seven people. More than three times as many as there are in any other part of the United States in the same number of square miles.

How to best serve this vast number of our neighbors? There is this large and progressive country as well as some foreign countries competing for this trade. We have an advantage in the race over all by location, and all other things being equal, we should get the most of it.

In the first place there must be a better feeling between the producer and commis-

sion merchant. This method of the grower doing everything he can to hinder the commission merchant from reaching the best results is a mistaken one. Their interests are inseparable. What is the commission man's success to the extent of one dollar is the grower's to the extent of ten dollars. I would impress upon your minds that it is not the increasing of commission merchants that increases the consumption of goods, that only increases the competition for the consumptive demand for your goods, and the more you divide the greater is the competition and the less profit you get. Do not give part of your goods to one man and another to his competitor in the same market one day, to-morrow giving them to still some one else in the same market expecting to get more; the natural result will be that you get less from the fact that the goods have not been in one place long enough to get a reputation so as to be sold on their merits. How often have I had certain goods returned to me because they had also been bought with the same mark of some one else at a lower price.

And when the young man who has no experience whatever in the market comes along and tells you the man who has sold your goods for the last twenty years is an old fogey, whom the business has outgrown, and is not progressive, and that he (the newcomer) can take your small crates and slack measures and sell them for just as much as others get for the full-sized ones, say to him that you do not want any of the progressive business, but the old-fashioned, honest business—that of justice to all.

(To be continued.)

## Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

A. B. DAVIS & SON, Purcellville, Va.—Catalogue of General Decorative Plants, freely illustrated. Roses a specialty.

LOVETT CO., Little Silver, N. J.—Book of 112 pages, well printed extensive list of fruit trees, small fruits, nuts and general garden plants.

FORT ROUGE GREENHOUSES, Winnipeg, Man.—Catalogue of Bulbs and Flowering Plants, also Annuals, Perennials, Ferns, and General Stock.

CHAS. WRIGHT, Seaford, Del.—Catalogue of Fruit Trees and Small Fruit Plants; also Grapes and Nuts. Contains many of the novelties in Fruits.

ALFRED F. CONARD, West Grove, Pa.—Catalogue of Flowers, Roses, Seeds and Plants. An exhaustive list with special offer of the Hybrid Sweetbriars and other Roses.

MARTIN BENSON, Dongola, Ill.—Exotic and Tropical Fruits for Pot Culture and the Orchard House. This catalogue contains a number of plants not frequently met with.

D. HILL, Dundee, Ill.—Catalogue of Evergreens for Transplanting Fruit Trees, Shrubs, etc., with Hints as to the proper care of each Tree and how best to use it in Gardens.

D. M. ANDREWS, Boulder, Col.—One hundred highly perennial plants in the Rocky Mountains. Some beautiful natives which should be seen more frequently in our gardens are here listed.

GLEN ST. MARY'S NURSERIES, Glen St. Mary, Fla.—Very Complete List of Fruits, Nuts, Citrus Fruits and Roses. The photograph illustrations of the Japanese forms render this a very interesting list.

VILMORIN-ANDRIEU & CO., Paris, France. General Catalogue of Seeds, Strawberries and Flowering Bulbs. An exhaustive list, making a valuable reference book. Contains colored plate of Phlox Drummondii varieties.

MONITOR INCUBATOR CO., Bristol, Conn.—Pamphlet of 78 pages, containing full detailed descriptions of the various incubators of the Company, illustrated, and directions for the management of poultry by incubators.

WM. RENNIE, Toronto, Can.—General Horticultural and Agricultural Seed List, with chromo-litho cover. Among the novelties offered are Field Pea, Odd Fellow, Danish Improved Sugar Beet, and some Potatoes. Fruit trees also included.

R. M. KELLOGG, Three Rivers, Mich.—Catalogue of Small Fruits, with exhaustive cultural guide in all sections. The valuable advice given by Mr. Kellogg and the freedom with which the text is illustrated renders this book an invaluable guide to the small fruit grower.

## The Fruit Garden.

**Peach Borers.**—Examine the trees for borers. Their presence is often shown on the trunk, generally at the ground line, or just below it, by exudations of gum mixed sometimes with castings from the insect. Cut off the gum, and with a pliable wire find and trace the run until you reach the insect at the end of the tunnel. Even if a narrow strip of bark must be removed for the purpose, do it. I find that it pays to remove the old tar paper and replace with new twice a year (spring and autumn). Use light paper, cut eight inches wide, and long enough to bind tightly twice around the trunk so that it is about four inches above the surface, filling in between the paper and the trunk with wood ashes.

**Tree Planting.**—This should be among the first of all spring work. The bulk of it can be done before the ground is fit for other operations in the garden by making use of the many mild days after frosty nights. When moving the trees note the amount of roots, and cut the top back more than you think at the time is really necessary.

**Large trees don't die in May,** but will show in August what the treatment has been, so help them by a heavy mulch now and a thorough soaking of water in June, or before, if there should be a long dry spell.

**Grapes.**—Prune and till, and finish at once any work on hand.

**Strawberries.**—Look them over, and press back any plants that have "heaved out." There is no danger of this if the covering has been sufficient. Some growers, when the covering is removed in spring, work in short manure to give the plants a start, but if in single lines and treated as advised in American Gardening for Dec. 26 last nothing is required other than is mentioned in the number for March 13.

**Apple Scab.**—This is very well known to many, and by very many allowed to thrive, and the result is spoken of as a "poor apple crop." Give the trees a drenching early in April with a solution of two pounds of copper sulphate dissolved in fifty gallons of water. Keep thoroughly stirred while applying. I believe this pest can be fought to better advantage before the buds burst. We do not know where or in what stage the fungus winters, but we do know that it can be almost, if not entirely, controlled when on the foliage by spraying thoroughly with Bordeaux mixture. There are a number of good inexpensive force pumps with which all the spraying in the average garden can be done. (See advertising columns.)

**Currants.**—Put in a few cuttings, so as to always have a stock of young bushes on hand. It is an easy matter to get them out of the way if you don't need them later.

Clean up and make sure that all prunings reach the rubbish heap, or, speaking more practically, burning pile, for it is no use to cart the prunings and diseased parts unless they are burned very soon.

J. HOLLOWAY, L. I.

## Home Grounds—How to Lay Out.

This supplement contains a half-tone drawing (6½x10½ ins.) of an estate of about six acres; this plan, together with the accompanying explanatory text, presents in a nutshell all the salient points of landscape gardening.

With the aid of this plan, and by careful study of its suggestions one can lay out an estate of one acre or fifty acres, for we give the cardinal principles which govern the art so clearly that all can understand.

Printed on heavy paper and forwarded, securely packed in a cartoon, on receipt of price, 25 cents, or given as a premium for one new subscription.

**Novelties.**—The public is rapidly drifting to the good old habit of seed planting of fruits, such being hastened by the unsatisfactory behavior of novelties and the behavior of much-handled and reshipped nursery stock delivered during the drought years. This is a wholesome sign and will be followed with a more personal and intelligent interest, and with local amateur personal work and effort.—Prairie Farmer.

## Novelties of the Season.

## (SIXTH SERIES.)

The descriptions given are those of the introducers.

**CARRIE STRAWBERRY.**  
(Fig. 76.)

It was originated by M. T. Thompson's Sons, of Rio Vista, Va., from seed of the Haverland. It has been thoroughly tried from Canada to Texas. Its season of ripening is from medium to early, and from all that have tried it is claimed to be superior to the parent. Professor Green, of the Ohio experimental, says it bears some resemblance to the Haverland in habit of growth and shape of berries, but the berries are larger, better colored, more glossy and firmer. It is scarlet color, with a nice green calyx, making it very showy when in crates.

**KING RED RASPBERRY.**  
(Fig. 58.)

King raspberry originated with M. T. Thompson's Sons in Lakewood, Ohio, in 1889. Professor H. E. Van Deman describes it as follows: Round, medium size; light crimson color; droops largely; few with suture very plainly marked; moderately firm; of excellent quality. Professor W. S. Green, of the Ohio Experimental Station, July 24, 1896, says King Raspberry is fine indeed; large, firm, beautiful color, and prolific, and at the station is far ahead of Loudon or Miller. J. T. Lovett says he believes it the most valuable red raspberry that has yet appeared, and it is exceptionally firm, making a good shipper. It is probably the brightest red in the market.

**STRAWBERRY HALL'S FAVORITE.**  
(Fig. 71.)

The accompanying illustration is reproduced from a photograph of this promising new strawberry, which originated with J. W. Hall, Marion Station, Md., but of which the parentage is unknown, it having been a chance seedling, selected on account of its vigor and the high color of its fruit. The plant makes a great growth, standing twelve or eighteen inches high on ordinary ground. Commission agents in New York report an easy sale for this berry at advanced prices. It has a perfect flower, and is a good pollinizer. berry firm, and a good shipper.

**Photographs**

Of notable fruits, vegetables, views in gardens, or in conservatories, etc., or of other subjects of interest to lovers of gardens, are solicited for the purpose of reproduction in our pages.

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

**Protection for the Farmers.**

The farmer who buys Bradley's fertilizers purchases and receives with every pound of every brand, something the value of which cannot be reckoned in dollars and cents, viz., the direct application in the manufacture of the Bradley Brands of all the best knowledge possessed by mankind on the subject of practical fertilization. The Bradley Fertilizer Company's chemists are constantly in touch with the most advanced agricultural thought of the world. Their experimental farms are used as a safeguard for their customers. Their superintendents continually study and devise the most skillful and economical methods and machinery. Their experienced executive department plans so that the farmer has the benefit of the skill and knowledge of each subordinate and employee. No wonder, then, that "Bradley Quality" is unmatched.

# Spring Hood's Sarsaparilla

Medicine is a necessity with almost everyone, because the blood needs purifying and enriching to prevent humors, eruptions and debility.

Is the best—in fact the One True Blood Purifier. All druggists. \$1; six for \$5.

**Hood's Pills** are prompt, efficient and easy in effect. 25 cents.

**ONE YEAR FOR 10 CENTS**

We send our monthly 16-page, 46 col. paper devoted to Stories, Home Decorations, Fashions, Household, Orchard, Garden, Floriculture, Poultry, etc., one year for 10 cents, if you send the names and addresses of six lady friends. **WOMAN'S FARM JOURNAL**, 4512 Evans Ave., Saint Louis, Mo. Mention American Gardening when you write.

**INCUBATORS** \$25, \$15, \$12 each. Brooders, 3 styles, \$5. Fowls, eggs, Ill. etc., 30. J. A. Chelton, Fairmont, Md. Mention American Gardening when you write.

**POULTRY BOOKS.** ABC Poultry Culture 25 cts.; 500 Questions and Answers, 25 cts.; Poultry House Plans, 25 cts.; Pigeon Queries, 25 cts.; Fanciers' Review 1 year, 50 cts. All \$1.00. Any 2 books, 40 cts.; 3 for 50 cts. J. DARROW, CHATHAM, NEW YORK. Mention American Gardening when you write.

**HATCH Chickens BY STEAM**  
WITH THE MODEL  
**EXCELSIOR Incubator**  
Simple, Perfect, Self-Regulating. Thousands in successful operation. Lowest priced first-class hatcher made. **GEORGE H. STANLEY**  
114 to 122 E. 6th St., QUINCY, Ill.  
Send for free circulars.

Mention American Gardening when you write.

**HIVES**  
and all supplies for the apary. Send for (34 page) illustrated catalogue of "Cook's complete Hives," and pure Italian Bees. It tells how to make a start in beekeeping. It gives valuable hints. Address  
**J. H. M. COOK, 62 Cortlandt St., N. Y. City.**  
Mention American Gardening when you write.

## Vegetable Gardening

A New Book for the Farmer and Market Gardener. Profusely Illustrated.

BY PROF. S. B. GREEN.  
Horticulturist Minn. State Experiment Station.  
Endorsed by leading horticulturists East and West.  
Price, postpaid, \$1.25.

Address  
**Webb Publishing Co., St. Paul, Minn.**

Mention American Gardening when you write.

Established 44 Years.

## ARCHDEACON & CO. Commission Dealers

100 Murray St., NEW YORK.

Fruits, Poultry, Game, Eggs, &c., &c.

ALL KINDS OF PRODUCE TAKEN ON COMMISSION

HOT HOUSE FRUITS A SPECIALTY.  
Mention American Gardening when you write.

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance. The address will be charged as part of the advt., and each initial, or a number, counts as one word. No cuts or display type allowed.

**HULSBOSCH BROS.**, bulbs and plants, Englewood, N. J.

**STRAWBERRIES**, Potatoes, Seeds. Catalogue free. Wm. Olds, Okemos, Mich.

**RASPBERRY PLANTS**, 50,000 Cuthbert, \$3 per 1000. J. M. Zion, Clarks Hill, Ind.

**O. F. BROWN**, Hamilton, Mass.—Sells plants, Raspberry, Blackberry and Currants.

**STRAWBERRIES**—Best plants of the best varieties. 50 cts. per 100 by mail. Wm. Perry, Cool Spring, Del.

**DAHLIAS**—500 varieties. Flower or Vegetable seeds, \$1.50 per hundred packets. H. F. Burt, Taunton, Mass.

**LOVELY ARBUTUS** plants, ferns and flowers cheap. Wymanock Nurseries, Lebanon Springs, N. Y.

**RADISH and LETTUCE** Seed for forcing. Write for Samples and Prices. Frank H. Battles, Seedsman, Rochester, N. Y.

**GLASS** at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York.

**SCHAFER COLOSSAL Raspberry** tips, \$2.50 per 1000. Strawberry plants, \$2 and up per 1000, true to name. Carson & Son, Rutland, O.

**DO YOU WANT** the best flower pots? If so, send address to The Whildin Pottery Co., 713 Wharton St., Philadelphia. Three shipping points, can save you freight.

**SEND** For Catalogue of Small Fruit. Best Eastern grown stock. Choice new varieties given as premiums for every order. E. W. Wooster, S. Hancock, Maine.

**MARIE LOUISE** Violets, extra healthy plants, rooted runners ready 1st of April, Violet clumps, April 20th. Price on application. F. G. Menre, Glen Cove, L. I., N. Y.

**RASPBERRY PLANTS**. Lowest wholesale price to nurserymen and dealers. Ohio tips from healthy 1 yr. set plants, \$3.50 per 1000. Turner, \$2.75 per 1000. Charles Nash, Three Rivers, Mich.

**SECOND** crop seed potatoes make early kinds larger and earlier. Be first, sure! New Queen, Thorburn, Burpee's Extra Early, etc. Prices very low. Free Pamphlet. John C. Pearce & Co., 480 W. Main St., Louisville, Ky.

**NEW PINK VIOLET** Mrs. J. J. Astor (named by permission), very fragrant, \$2.00 per dozen, \$19 per 100. Also Marie Louise. \$1 per 100, any quantity. Orders filled in rotation. G. Saltford, Violet Specialist, Rhinebeck, N. Y.

**STRAWBERRY PLANTS**. Try the Margaret Fountain, Michigan, Clyde; Glen Mary. Headquarters for Gandy, Brandywine Marshall, Parker Earle and all choice standards. Catalogue free to all. C. N. Flansburgh, Leslie, Mich.

**CEDAR OIL INSECTICIDE**, better and cheaper than fir-tree oil, \$3.50 the gallon; \$1.00 the quart tin. Cedar Oil Soap, pound tins, 50 cents; half pounds 25 cents. Sold by seedsmen and florists. August Rolker & Sons, New York, P. O. Station E.

**SUCCESS**, an early market berry, a seedling of the Bubach, fertilized by Michel's Early. Perfect blossom, an improvement on Bubach in size, firmness and quality. Early and productive. Dose, 40 cts. a 100; \$1.00 a 1,000. Address Originator, Geo. N. Hannah, Whigville, Conn.

**GLADIOLI, CANNAS, CLIVIAS**, Souchet and Lemoine's novelties first offered in America. Special tested selections at European prices. Extra mixtures: Ingleside Hybrids, Dr. Van Fleet's choice collection, Burbank's California Select, Mt. Vernon Hybrids, Groff's Hybridized Seed and Seedlings, Cannas, Italia, Austria, and best standards. New Hybrid Clivias. Canna Seed. H. H. Groff, Simcoe, Ontario, Canada.

**1,000,000** Strawberry Plants of 30 well tested varieties, from \$1.50 to \$2.00 per 1,000. 100,000 Michel's Early, \$1.25 per 1,000, \$10 per 10,000. All healthy, young well rooted plants, true to name, and securely packed free. A good stock of No. 1 Peach-trees, of a few well tested reliable varieties, healthy and free from scale. Get my price list before purchasing. Any information of varieties culture etc., cheerfully given to those who want stock. Address Chas. Black, Hightstown, N. J.

**20 ACRES** rich, level farm land, free from rocks and swamps, and especially adapted for truck, fruit, cotton and tobacco raising, for \$300, payable \$10 down and \$1 or more weekly. Convenient to great eastern markets, in thickly settled section of Virginia. Genial climate all year. Splendid water. Schools, churches, stores, mills and desirable neighbors. Deed free and title guaranteed. No malaria, mosquitoes, blizzards or floods. Taxes and freight very low. For further information write to D. L. Risley, 211 S. 10th St., Philadelphia, Pa.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 12, 1894.

PUBLISHED BY  
A. T. DELAMARE PTG. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 5154 Cortlandt. P. O. Box 1697.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 35 cents per agate line; in "For Sale" column, 5 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**THE** one great practical question before the horticulturist to-day is that suggested in the title of this article. When it is remembered that the greater proportion of our most noxious insects are of foreign origin, the necessities of the case cannot be gainsaid, and it is the plain duty of all persons interested in trading of nursery stock to assist in securing such quarantine measures as may be necessary to protect the best interests of the community at large.

That certain responsible men are very much in earnest in this matter is to be seen from a perusal of the report of the National Convention, as published on page 172 of our issue for March 13. It is a fact, however, that a large section of the horticultural public is apathetic and slow to move, and for that reason we seek now to draw more attention to the results of the Washington Convention, and to urge that all send their one dollar membership subscription to the secretary, Wesley Webb, Dover, Del.

The bill to be introduced into Congress is as follows:

Section 1. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled.

That the Secretary of Agriculture be and he is hereby authorized at the expense of the owner or owners to place and retain in quarantine all trees, plants, buds, cuttings, grafts, scions, nursery stock and fruit, imported into the United States at such ports as he may

designate for such purposes, and under such conditions as he may, by regulation prescribe, and that he may appoint inspectors for the purpose of examining such trees, plants, buds, cuttings, grafts, scions, nursery stock and fruit for the purpose of ascertaining whether they are affected by any dangerously injurious insect or disease, the importation of which will be prejudicial to the horticultural interests of the United States, and provide for the treatment of such when found necessary.

Sec. 2. That when such trees, plants, buds, cuttings, grafts, scions, nursery stock and fruit shall be determined to be infested with any dangerously injurious insect or disease, they shall be treated at the expense of the owner or owners in accordance with the regulations of the Secretary of Agriculture, or they shall be destroyed in case their condition is such as to warrant such destruction, but an appeal may be taken from the decision of the inspector to the Secretary of Agriculture if such appeal be taken within three days after such inspection, and the decision of the Secretary of Agriculture shall be final.

Sec. 3. That when such inspection shall show that such trees, plants, buds, cuttings, grafts, scions, nursery stock and fruit are apparently free from dangerously injurious insects or disease, a certificate to this effect made in accordance with the regulations of the Secretary of Agriculture shall be issued to the owner or owners thereof by the said inspector, and this certificate shall operate to release all the objects above specified, when duly stamped or labeled with the same, from further quarantine or restriction either at the said port of entry or in interstate commerce. Any person who shall forge, counterfeit or knowingly alter, deface or destroy any of the marks, stamps or certificates provided for in the regulations of the Secretary of Agriculture, on any such trees, plants, buds, cuttings, grafts, scions, nursery stock or fruit, or who shall forge counterfeit or knowingly and wrongfully alter, deface or destroy any certificate provided for in said regulations, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine not to exceed \$500 or imprisonment not to exceed one year, or both, at the discretion of the court.

Sec. 4. That whenever it shall appear to the Secretary of Agriculture that any foreign country shall have provided proper and competent inspection and treatment in accordance with the provisions of this act for the objects above specified as being subject to inspection and treatment, he may, by proclamation or otherwise, accept such inspection and treatment in lieu of inspection performed by officers appointed by himself, which acceptance or proclamation by the Secretary of Agriculture shall relieve all such articles specified in the foregoing sections of this act, when properly stamped or labeled, from further quarantine or restrictions.

Sec. 5. That the Secretary of Agriculture shall cause to be inspected and properly treated, at the expense of the owner or owners, prior to their shipment, all trees, plants, buds, cuttings, grafts, scions and nursery stock, which are subjects of interstate commerce, and which are about to be transported from one State or Territory or the District of Columbia into another State or Territory or the District of Columbia.

Sec. 6. That the said examination shall be made in the manner provided for by the rules and regulations prescribed by the Secretary of Agriculture, and that after such an examination the trees, plants, buds, cuttings, grafts, scions or nursery stock found to be apparently free from dangerously injurious insects or diseases, shall be marked, stamped or labeled for identification, as may be provided for by said rules and regulations of the Secretary of Agriculture, and when so stamped or labeled they shall not be subjected to further quarantine or restriction in interstate commerce. Any person who shall forge, counterfeit or knowingly alter, deface or destroy any of the marks, stamps or said devices, provided for in the regulations of the Secretary of Agriculture on any such trees, plants, buds, cuttings, grafts, scions and nursery stock, or who shall forge, counterfeit or knowingly and wrongfully alter, deface or destroy any certificate provided for in said regulations shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine not exceeding \$500 or imprisonment not exceeding one year or both such punishments at the discretion of the court.

Sec. 7. That it shall be unlawful for any person, persons or corporation to transport from one State or territory or the District of Columbia into any other State or territory or the District of Columbia, or for any person, persons or corporation to deliver to any person, persons or corporation for transportation from one State or territory or the District of Columbia into any other State or territory or the District of Columbia, any trees, plants, buds, cuttings, grafts, scions or nursery stock, which have not been examined in accordance with the provisions in sections 5 and 6 of this act, or which on said examination have been declared by the inspectors to be dangerously infested with any injurious insects or diseases. Any person, persons, or corporation violating the provisions of this section shall be guilty of a misdemeanor, and upon conviction thereof shall be punished

for such offense as provided in section 6 of this act.

Sec. 8. That whenever it shall appear to the Secretary of Agriculture that any State, territory, corporation, firm or person shall have provided proper and competent inspection and treatment in accordance with the provisions of this act for the objects specified, as being subject to inspection and treatment, he may by proclamation or otherwise accept such inspection and treatment in lieu of inspection performed by officers appointed by himself, which acceptance or proclamation by the said Secretary of Agriculture shall relieve all such articles specified in sections 5, 6 and 7 of this act, when properly stamped or labeled from further quarantine or restriction in interstate commerce.

**WE** give in this issue a summary of the provisions of the new tariff bill, in so far as the special interests of our readers are concerned. If protection can put money into the agriculturist's pocket, the passage of this bill should make him content. Although it is a fact that he will have to buy protected vegetable seeds which cannot be grown here, he has the satisfaction of free fertilizers and a heavy duty on imported produce and nursery stock.

But the farmer who looks to tariff legislation as a means of bettering his condition, will not win the race. As in the past, so in the present and for all time: the successful farmer is he who raises the best, markets honestly, and conducts his operations on sound business principles of honor and justice to all.

## English Potatoes in America.

You are doing good service to the gardening and farming community in calling attention to the fact that imported potatoes will not grow in America; for every year farmers, usually of the poorer class, and who can ill afford such failures, in looking around for what appears to be cheap but good seed potatoes, buy imported potatoes in the markets of New York—but one lesson is enough for them.

We can indorse all that has been said in "American Gardening" regarding the unsuitability of the English potato for the American climate, having tested nearly all the well-known English varieties. For a number of years past our potato tests have included several new varieties sent us from England for trial, but they have without exception been dismal and disappointing failures. As Mr. Herrington, in your issue of the 13th (page 179), remarks, there is room for a first-class early potato in the United States. We fully appreciated this fact, and for a number of years past have been on the outlook for such, and we think we have in the "Bovee," which we are offering this year for the first time, a variety that will fill the breach. From the time our attention was first called to it in 1894 we have carefully tested this variety and have compared notes with a number of expert growers, and we believe that the "Bovee" has every desirable feature to be found in the Ashleaf Kidney potato so popular in England. The "Bovee," too, by reason of its extreme earliness and good quality, is going to become popular in England as well. We sent to experts there a few tubers for trial, and their reports coincide with the high praise it has received from all parts of America. Mr. John Crawford, of Coddington Hall, Newark-on-Trent, England, a well-known

gardener and potato specialist, writes: "I can speak in the highest terms of your new potato which you sent me for trial. I planted it by the side of the Early Puritan, Sutton's Ringleader and another new sort, and it out-distanced them all. I consider it as early as any white variety and earlier than any colored sort. It is of perfect shape, and will make a great exhibition potato, and last but not least, the quality when cooked is unsurpassed. Some fell quite asunder by reason of their mealiness when placed on the dish. I feel certain it will prove quite an acquisition here."

Messrs. Sutton & Sons in their catalogue describe the Ringleader as follows:

"Maintains its position as the earliest

Jumbo, which came from England, but which at best was coarse, and no doubt it was its coarse and rugged nature that enabled it to stand the more trying climate of America. Mr. Herrington mentions Snowdrop as one of the imported varieties in his trial, and we may add that, knowing the value of this potato in England, we imported some and grew it for nine years in the hope that it would eventually become acclimatized, but were forced to the conclusion that it was a hopeless task. We grew it not only in a small way but in fairly large quantities as a field crop, and annually selected the best tubers for seed purposes.

PETER HENDERSON & CO.,  
New York.

FIG. 71—STRAWBERRY HULL'S FAVORITE. (See page 221.)

Kidney potato in cultivation. It possesses the great advantage of being white in the flesh, and is perfectly distinct from all other early Kidney varieties, having foliage quite unlike that of the Ashleaf class. Haulm moderate in height, and robust for an early potato. Flavor and quality excellent as soon as the tubers are large enough to lift, and the crop can be raised so early that there is no probability of its being stricken by disease."

The value of such a comparative test will be apparent to all. Others in England to whom we sent some for trial speak equally highly of it. This shows that at least some varieties of American potatoes succeed in England, but so far as we know the only exception in the case of an English variety succeeding in America is the

**Spring Flowers.**—In Jersey City, N. J., the signs of spring were seen on March 23, in the garden of E. S. Brown; this was a grand display of crocus bloom, perfect sheets of white and purple. In our own garden *Galanthus Elwesii* (the giant snow-drop) was the first flower of the year; it opened on March 21.

#### Will Stay for Good.

Your paper is a valuable help to me in raising plants and flowers, and I intend to keep it for good.—M. S., DAVENPORT, IA.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send the price to the Publishers.

Our publishers will supply any book wanted.

## The Tariff.

For the benefit of our readers the following details are extracted from the Dingley Tariff bill, now before Congress:

Beans, berries, buds, bulbs, bulbous roots, herbs, leaves, nuts, roots, stems, vegetable seeds (aromatic, not garden), used for dyeing and which are advanced in value by refining, grinding or other process, 10 per cent. ad valorem.

Leaf tobacco, suitable for cigar wrappers, not stemmed, \$2 per lb.; if stemmed, \$2.75 per lb.

All other tobacco in leaf, not stemmed, 65c. per lb.; if stemmed, 80c. per lb.

Buckwheat, 15c. per bushel of 48 lbs.

Corn (maize), 15c. per bushel of 56 lbs.

Rice, cleaned, 2c. per lb.

Sulphate of Copper, 1c. per lb.

#### FARM AND FIELD PRODUCTS.

Beans, 50c. per bushel of 60 lbs.

Beans, peas and mushrooms, prepared or preserved, 2½c. per lb., 15 per cent. ad valorem. All vegetables prepared or preserved, including pickles, 40 per cent. ad valorem.

Cabbages, 3c. each.

Cider, 5c. per gal.

Hay, \$4 per ton.

Hops, 15c. per lb.

Onions, 40c. per bushel; garlic, 1c. per lb.

Peas, green, in bulk, 40c. per bushel of 60 lbs.; in small packages, 1c. per lb.

Plants, trees, shrubs, vines, bulbs and roots of all kinds, for growth in the open air or otherwise, not specially provided for in this act, 30 per cent. ad valorem.

Potatoes, 25c. per bushel of sixty pounds.

Seeds \* \* \* of all kinds not specially provided for in this act, 40 per centum ad valorem. (This includes all vegetable seeds.)

Vegetables in their natural state not specially provided for in this act 25 per cent. ad valorem.

#### FRUITS AND NUTS.

Apples, green or ripe, 25c. per bushel; apples, peaches and other edible fruits, including berries when dried, desiccated, evaporated or prepared, 2c. per lb.; berries, edible, in their natural condition, 1c. per quart.

Fruits preserved in sugar or molasses, or in their own juices, 35 per cent. ad valorem.

Figs, Plums, prunes, raisins and other dried grapes, 2½c. per lb. Dates and currants, 1½c. per lb. Olives, green or prepared, 25c. per gallon and 15c. per gallon according to package.

Grapes and peaches, 1c. per lb.

Oranges, lemons, limes, grape fruit, shad-docks or pomelos, ¼c. per lb., and 30 per cent. ad valorem upon boxes, etc.

Pineapples, 2c. per lb.

Almonds, not shelled, 5c. per lb.; shelled, 7c. per lb.

Filberts and walnuts of all kinds, not shelled, 3c. per lb.; shelled, 6c. per lb.

Peanuts or ground beans, unshelled, 1c. per lb.; shelled, 1½c. per lb.

Nuts of all kinds not specially provided for, 1½c. per lb.

Mustard, ground or prepared, 10c. per lb.; capsicum or red pepper, 2½c. per lb.; sage, 1c. per lb.

Vinegar of standard strength, 7½c. per gallon.

Cherry juice, prune juice, prune wine and other fruit juices not specially provided for, containing no alcohol or not more than 18 per cent. alcohol, 60c. per gallon.

Peat moss, \$1 per ton.

#### FREE LIST.

Ashes, wood, blood, dried bones, crude or not burned, calcined, ground, steamed or otherwise manufactured, and bone dust and ash fit only for fertilizing purposes.

Beans, berries, balsams, buds, bulbs, fruits, flowers, herbs, nuts, aromatic seeds, etc., used for dyeing, not edible and not advanced in value by grinding or other process.

Fruits—Green, ripe or dried, not provided for in the act.

Guano, kainit, manures, and all substances expressly used for manure.

Hop roots for cultivation.

Moss, seaweeds and crude vegetable substances not otherwise provided for.

Nuts—Brazil nuts, cream nuts, palm nuts, cocoanuts in the shell.

Oil cake.

Phosphates, crude or native.

Plants, trees, shrubs, roots, seed cane and seeds imported by the Department of Ag-

riculture or the United States Botanic Garden.

Plaster Rock or gypsum crude.  
Potash, sulphate, or muriate.

Seeds—Anise, caraway, cardamon, cotton, cummin, fennel, fenugreek, hemp, horehound, mustard, rape, St. John's bread or bene, sugar beet, mangel wurzel, sorghum, or sugar cane, for seed, and all flower and grass seeds; all the foregoing not specially provided for in this act.

Soda nitrate.

Sulphuric acid for use in manufacturing artificial manures for agricultural purposes. If from a country charging duty on United States exported sulphuric acid,  $\frac{1}{4}$ c. per lb.

Tobacco stems.

## Mushrooms:

### Structure and Classification.\*

The greater number of the toadstools common in fields and woods belong to a group of which the common mushroom of our pastures and markets may be taken as the type. This consists of a stem, cap and gills. The gills are radiating plates extending from the stem to the edge of the cap. On them are borne in countless numbers the spores, extremely minute bodies which are roughly analogous to the seeds of flowering plants. The mushroom, in fact, is simply a contrivance for the production and dissemination of the spores.

The vegetative portion of a mushroom consists of a network or web of delicate threads, generally colorless, which envelop or permeate the animal or vegetable substance, living or dead, from which the fungus draws its food supply. For fungi do not elaborate their food from raw materials, as do the plants that have green coloring matter, but are dependent upon other organisms; i. e., they are either parasitic upon living animals or plants, or are saprophytic upon dead organic matter. The minute vegetative threads, collectively called the mycelium, result from the germination of the spores. The actual process is far beyond the reach of the naked eye.

In the case of the common mushroom, what is known by mushroom growers as the "spawn" consists of a dried compressed portion of a mushroom bed, generally mixed soil and horse droppings, which is permeated by the mycelium. In this condition, in the form of flakes or bricks, it may be transported, and will keep its vitality for months, active growth being for the time arrested. As a rule, then, when mushroom beds are started, the mycelium, in the form of "spawn," is planted, not the spores. When the proper conditions of warmth and moisture are supplied, growth is resumed, and the threads, lengthening, branching, and anastomosing, soon spread throughout the bed.

It is plain, then, that the mushroom plant, for most of its life, is out of sight, and consequently not familiarly known. To this fact are due many erroneous notions about the origin of mushrooms themselves. When the time has come for the plant to produce its fruit, there form at various points in the mycelium small masses of densely branching interwoven threads, which in time enlarge to an appreciable size. Each of these masses is the beginning of a "button," or nascent mushroom. An examination of buttons in various stages of growth, by means of thin sections under a microscope, shows pretty clearly the part played by the mycelial threads in building up the mushroom proper, the substance of which is made up of the compacted and closely interwoven threads and their branches. Along certain radiating lines is formed the framework of the gills, which in the developed mushroom is called the trama. Just below the gills an air-space appears, the outer wall of which becomes the so-called veil. Lastly, upon the surface of the gills develops a layer of cells standing side by side, like the single threads in the pile of velvet or in the surface of an Oriental rug. With these cells we have a special concern. Taken together they form the hymenium,

There doesn't seem to be very much the matter with your child. He doesn't actually lose weight, but there is no gain. He belongs to that large class of children that don't seem to prosper. You look at him a little more thoughtfully than you do at the rest and say "He is not doing well." Failure to gain in weight in a child is a danger signal. Scott's Emulsion should be taken at once. It puts on fat where health demands it, strengthening the digestion.

SCOTT & BOWNE, Chemists, New York.

## NEW CREATIONS IN FLOWERS.

If you want to know about them send 10 cts. for Mrs. Theodosia B. Shepherd's

New Catalogue of Rare and Beautiful Flowers.

\*Delivered before the Massachusetts Horticultural Society by Secretary Hollis Webster of the Mycological Club.

the spore-producing tissue, which, folded like a fan, is applied to both sides of the gill-plates. A section through a gill shows us this layer. Each one of the spore-bearing cells composing it is called a basidium. Each basidium bears four spores on minute stalks.

Other groups of fungi, besides those which have gills, have a similar exposed hymenium. In one the hymenium covers the surface of spines; in another it lines the interior minute tubes or spores; in a third it covers the end of branches. All these groups are united under the name of Hymenomycetes. In the puffballs, on the other hand, and allied forms, the hymenium is enclosed, lining the surface of small chambers in the interior of the body of the fungus. These are the Gastromycetes. Inasmuch, however, as both the Hymenomycetes and the Gastromycetes, together with others not necessary to mention here, all have the same form of fructification, viz.: basidia-bearing stalked spores; all these fungi are included under the name Basidiomycetes.

A parallel case of fungi is represented by the Morel. In this mushroom and a great number of other fungi the place of the basidium is taken by what is called an ascus, which is a minute sack in which the spores are developed. Each ascus usually produces eight spores in its interior, which escape at maturity through an opening in the end. To the many groups of fungi having this kind of fructification is given the name Ascomycetes.

Most of the mushrooms gathered and studied by the increasing number of fungus-hunters belong to that group of the Basidiomycetes which is called Hymenomycetes. Among these Boletus and Polyporus are easily recognized by their pores; Hydnum by its spines or papillae; Clavaria by its coral-like or filiform appearance; and Tremella by its gelatinous nature. The puzzles in identification come among the Agaricini or gill-bearing mushrooms, which are built for the most part on the same general plan and can often be separated from one another only by the most careful scrutiny of a long-practised eye. For the classification of these mushrooms, not only must attention be paid to the shape, surface, and color of the cap; the shape and attachment of the gills; the nature of the stem, inside and out; but the color and sometimes even the shape and size of the spores must be noted, and even the most minute and apparently incidental peculiarities must be taken into account.

The Agarics proper are divided into five groups of differences of spore color; these groups are still further divided into genera by differences in gross and minute structure. For example, in the white-spored group, Amanita is known by its volva; Lepiota by its ringed stem and free gills; Armillaria by its ring and adnate gills; Clitocybe by decurrent gills; Collybia by a cartilaginous stem; Tricholoma by notched gills, and so on through the list. With the pink-spored Agarics we run through a similar category of structural differences, and so with the brown spored, the purple spored, and the black spored, although in the last three groups by no means all types of structure are represented. Other genera not included in the old genus Agaricus are by late systems, such as that used by Saccardo, included with the genera already mentioned under four groups divided according to spore color. Among these are Cortinarius, distinguished by its arachnoid veil; Coprinus, which dissolves to ink; Cantharellus, with gills like swollen veins; Lactarius, with milky juice; Lentinus, with tough substance and serrate gills, and others.

In conclusion Mr. Webster spoke of the great services to mycology of Elias Fries, the revered Swedish botanist who systematized the classification of mushrooms. The lecture was illustrated throughout by lantern slides.

Catalogues are pouring in upon us, and the selection of plants and seeds is in order. Be careful not to take too much stock in glowing pictures. Novelties are not always to be relied upon. But if you have the space by all means try a few of them.

**Appointments and Doings.**

Gardeners and others knowing of recent appointments and movings are requested to forward particulars of the same for publication in this column. No charge is made.

W. E. Chappell has been selected as superintendent of the exhibition to be held next August on the occasion of the Society of American Florists' Convention at Providence, R. I.

C. V. Whitten, of Dorchester, Mass., is dead. His range of greenhouses was in charge of Lawrence Cotter.

Justin Sackett, landscape gardener, died at Springfield, Mass., on March 3, aged eighty-three years. He laid out the Forest Park grounds in that city, and did much cemetery work in Vermont and Massachusetts.

W. R. Smith, superintendent of the Botanical Gardens, Washington, D. C., has been sick for over two weeks.

Mr. James Cummings has succeeded Mr. W. M. Edwards as gardener to R. Hazard, Peace Dale, R. I.

Mr. James Delaney, formerly gardener to the late Robert P. Belknap, Seabright, N. J., has secured the position of head gardener to Mr. F. V. Burton, Newburg, N. Y.

William Rennie, who was for some time employed by Mr. George H. Lewis, Buffalo, N. Y., has secured the position of head gardener to Mr. William P. Gill, Brooklyn, N. Y.

Mr. William Fitzwilliam, lately with William Barr, Esq., Llewellyn Park, Orange, N. J., has secured the position of head gardener to George H. Lewis, Esq., Buffalo, N. Y. Mr. Fitzwilliam is well and favorably known to readers of American Gardening, also to many of the craft around New York, and he takes with him best wishes for his future prosperity.

Mr. Wilhelm Corders, formerly of Litchfield, Conn., has gone to Danby, Vt., to take charge of the greenhouses and grounds of S. L. Griffith, Esq.

Mr. John Hutchinson, lately with Mr. W. R. H. Martin, Greenwich, Conn., has succeeded Mr. Sanger as gardener to Dr. Wiley.

Mr. Angus MacDonald, lately gardener at the Executive Mansion, Albany, N. Y., is in town looking for a head gardener's place. James Marke as gardener to W. A. Parke, Greenwich, Conn., in place of A. Kruger, resigned.

A. Kruger as gardener to Hon. J. G. Cannon, Scarsdale, N. Y., in place of Walter Ernest, resigned. Mr. Cannon has one of the finest places in Scarsdale.

Samuel J. Trepass, for the past seven years gardener to Mrs. A. W. Blake, Brookline, Mass., will resign his position on April 1, to enter into business with his old friend, H. M. Sanders, florist, Spokane, Wn.

Mr. Robert Petfield, formerly under gardener at Mrs. Ames' place at North Easton, Mass., is one of the men in the city at the present time looking for a head place.

Mr. William Blacklock, who was recently one of the assistants at the Dinsmore place, Staatsburg, N. Y., has gone to work with the Lovett Company, Little Silver, N. J.

Mr. Alexander Geddes, recently assistant at J. D. Wing's place, Milbrook, N. Y., is now gardener at Sanford Hall, Flushing, L. I.

**The Roll of Honor.**

Since the publication of my paper on "The Professional Gardener's Mission in Horticulture," read before the Lenox Horticultural Society, I have received some additions to the "Roll of Honor" and beg leave to send the same herewith for publication in "American Gardening." I take this occasion to say that gardeners in all sections of the country, some of whom are now in the commercial ranks, have written to me in flattering terms regarding that paper, and it seems as though my effort will result in some good, as was earnestly hoped.

Mr. Richard Lewis, gardener to Miss Catherine Cruger, Barrytown, N. Y., raised a new fern, *Pteris Crugeriana*, which has not as yet been introduced into commerce. He reports discovering it in a batch of seedlings of *Pteris tremula* and *P. longifolia*, and is, properly speaking, a spontaneous hybrid.

Mr. A. P. MeredKh, gardener to Nathaniel Thayer, of South Lancaster, Mass., has written informing me that while he was gardener to Colonel Cutting, Pittsfield, Mass., he raised a new Anthurium, which has been introduced into commerce as *A. Cuttingianum*. He is the proud possessor of a certificate of merit for it from the Lenox Horticultural Society.

Mr. Alex. L. Marshall, gardener to J. B. Dutcher, of Pawling, N. Y., raised a new Coleus, a sport from "Bizarre," which was introduced in 1891. He is now experimenting with Cannas and expects to have some worthy of introduction before long.

George B. Winslade, gardener to Mr. Osborn, raised the chrysanthemum C. J. Osborn, which was introduced about five years ago.

The following communication was received from Alex. MacLellan, Newport, R. I.:

Mr. Patrick O'Mara:

My Dear Sir—I had already read in the garden papers that excellent paper of yours on "The Professional Gardener's Mission in Horticulture" when I received the pamphlet you kindly sent. I note your request for information regarding new plants which had been raised by gardeners, and as secretary of our local Horticultural Society I write to inform you what new plants have been awarded the society certificates or medals since our organization in 1890, that is, as regards such plants as have been raised by private gardeners.

November, 1891—Chrysanthemum Stone-acre Gem (anemone), bronze medal; raised by Alexander MacLellan (sent out by Spaulding). To a white unnamed chrysanthemum raised by Mr. Richard Gardner, a bronze medal. Seedling Orchid Calanthé, raised by Mr. Richard Gardner, a silver medal (not disseminated).

November, 1892—To Chrysanthemum San Salvador, raised by Alexander MacLellan, a silver medal (Spaulding).

November, 1893—To Chrysanthemum Roger Williams, raised by Alexander MacLellan, a silver medal (sent out by Spaulding).

November, 1894—Canna Mrs. Fairman Rogers, raised by Mr. James S. Cowles and introduced by him in 1895, a silver medal.

November, 1895—Fern Lomaria gibba blechnoides, raised by Alexander MacLellan, a silver medal (not disseminated).

There were other plants that obtained notice, such as special mention, etc.

At the New Bedford Gardeners' and Florists' Club exhibition last fall I was awarded first, second and third for seedling Chrysanthemums, none of which are yet named.

I was pleased with the stand you took in regard to our title.

(Signed) ALEXANDER MACLELLAN.  
Gardener.

Secretary Newport Hort'l Society.

Mr. Alexander Kennedy, of New Brunswick, N. J., writes to me, and the following is taken from his letter: "The double Abutilon (Thompsonii plena) originated with me when employed as gardener to John T. Johnson, at Plainfield, N. J., in the year 1882. The original plant I brought there from my own place near New Brunswick, N. J. It was used as a decorative pot plant and grew to be a large plant about seven feet high, well furnished from the bottom up. In the winter of 1882 I noticed some of the flowers on a shoot near the top that

looked different from the others. I watched them closely and came to the conclusion after a while that I had found a double Abutilon; all the other shoots on the plant bore single flowers. I sent specimens of the flowers to the late Peter Henderson and asked if he had ever seen or heard of a double Abutilon. His reply was that he had never seen one but had heard of some being in England. After some negotiations he bought all the stock I had propagated, and now I suppose it is to be found all over the world. Although a "sport" pure and simple, it has never reverted to the original type.

"In regard to *Aschyranthus Gilonii*, would say that the raiser of it was Alexander Gilon, a colored man and well worthy to bear the title of gardener. I was a neighbor of his and knew him well. It was about the year 1873 that he raised the *Aschyranthus*. He was then the gardener for Mme. Livingstone, and afterward for her successor, Mrs. Barton, on what was called "the Montgomery place," once the country residence of General Montgomery, from which it took its name. It is located in the town of Red Hook, Dutchess County, N. Y."

The following is an extract from a letter sent to me by Mr. Frank B. Lown, one of the leading lawyers in Dutchess County, N. Y., and an ardent horticulturist: "I am particularly interested in one name mentioned in your 'Roll of Honor,' and that is the *Aschyranthus Gilonii*, which you say was raised by a colored gardener. When I was a child I lived in Barrytown, in this county, and I well remember Alexander Gilon, who was then the gardener on what was known as the 'Barton place,' a couple of miles north of where we lived. He was a colored man, but he very justly earned and received the cordial liking and respect of the entire community. He was an accomplished gardener, and died but a few years ago, and I am rejoiced to know that now the name of old 'Alexander'—and no one knew him by aught else—has been perpetuated by the plant referred to in your speech."

To the foregoing I can add that the late Mr. Peter Henderson held Alexander Gilon in high esteem, and all this goes to show that true merit, no matter how unobtrusive, is always recognized by those whose recognition is worth having.

PATRICK O'MARA.

Mr. Max Klockow is now head gardener for Mr. Kalbfleisch, Babylon, L. I.

Mr. Michael Cunningham, who was at one time an assistant at W. K. Vanderbilt's place, Islip, L. I., is now gardener at St. Joseph's Convent, Flushing, L. I.

#### The Monmouth County, N. J., Horticultural Society.

The regular semi-monthly meeting of the Monmouth County Horticultural Society was held at Oceanic, N. J., on Friday, the 19th inst. As proof of the members' devotion to their society, a great many of them traveled a distance of four miles and more in order to attend, notwithstanding the remarkably bad weather. The schedule of prizes to be offered at the fall exhibition will be printed and distributed within the next three weeks. From facts already in the possession of the society, the success of the exhibition is assured. The next meeting will be held in Firemen's Hall, Oceanic, on April 2, at 7.30 P. M.—G. A. STEELE, Secretary.

#### Lenox Horticultural Society.

The society held its regular meeting on March 20, Mr. G. H. Thompson in the chair. There were about thirty-five members present, which was a good attendance considering the condition of the roads at the time. Mr. J. N. May was the essayist of the evening, his subject being "Horticulture."

In the discussion which followed Mr. May had to be constantly upon his feet answering questions. As to grafted or budded roses versus those upon their own roots, Mr. May was of opinion that "own roots" were best, especially in the ordinary bench. If any one doubted this he advised him to plant some of each and to keep an accurate account of the returns.

Mr. May exhibited fine examples of President Carnot rose, Maud Dean and Lilly Dean carnations and a new hybrid tea rose, Clara Watson. All of these were much admired.

A rising vote of thanks was accorded Mr. May for his excellent essay and for the part he took in the discussion.—E. J.

#### Prizes for Sweet Peas.

The Hampden County Horticultural Society (Springfield, Mass.) announces several premiums for its Sweet Pea Show, to be held in July. W. Atlee Burpee & Co. offer \$10 for Cupid, the money to be divided into three prizes; also \$5 each for Burpee's Aurora, Brilliant, Burpee's New Countess, and Blanche Burpee; also for the best general display, a collection of twenty-one books on horticultural topics. Peter Henderson & Co. offer \$10 for novelties exhibited. The Sunset Seed and Plant Company, \$15 for Red Riding Hood, \$5 for Golden Gleam, and several cash prizes for literary work, such as briefest, clearest and most practicable cultural directions for sweet peas; for the best system of color classification, and for the best criticism of their Sweet Pea Review, and \$5 for best ten sprays of sweet peas in each color class, as named in the Sweet Pea Review. Henry Eckford, of Wem, England, offers a challenge cup, value not less than \$25, for the best display of Eckford's novelties for the current year. This is a grand offer, and will draw out a spirited competition. There are also offers by Rev. Mr. Hutchins, O. H. Dickinson, the B. L. Bragg Company and others, making a grand list, and this, with the society's regular schedule, forms a very attractive premium list.

#### American Dahlia Society.

The annual spring meeting of the American Dahlia Society was held at Hotel Hanover, Twelfth and Arch streets, Philadelphia, Wednesday evening, March 17, President Kift presiding. Treasurer F. C. Bruton reported the society to be in a prosperous condition, with a large balance in the treasury. Mr. Robert Craig, of Philadelphia, was made an honorary member on motion of Mr. Bruton.

The nomination of officers was then held. There being no opposition, the Secretary cast a ballot for those nominated, as follows: Robert Craig, president; Henry F. Michell, vice-president; E. Clifton Taylor, secretary; Frank C. Bruton, treasurer, and A. Blanc, chairman of executive committee. President Kift appointed committees on Nomenclature, Schedule and Finance.

Henry Eicke, of New York city; C. W. Ward, Queens, New York, and Samuel C. Moon, Morristown, Pa., were elected to membership.

The motion to appoint a committee on Constitution and By-Laws was carried, and Robert Kift, David Rust and E. Clifton Taylor were named. C. W. Ward was appointed on the Executive Committee in place of J. D. Eisele, resigned.

On motion of Mr. Michell, the Schedule Committee was instructed to have schedule printed not later than April 15.

The annual fall exhibition is to be held Tuesday and Wednesday, September 21 and 22, at a hall to be decided upon later.

E. CLIFTON TAYLOR, Secretary.

#### The Private Gardener and His Employer.

On page 181 "An Orange County Friend" has kindly taken the professional (?) gardener into consideration. It gives me great pleasure to think that the "waters are being troubled," and I hope that the professional gardener will receive strength to take a dip, but unfortunately he is one of those fellows who are perfectly satisfied when there is corn in their own manglers, and for certain reasons is very reluctant to trouble the waters for the benefit of his fellow craftsmen. The last sentence in the article on page 165 is the result of my feelings being troubled in behalf of the craft after reading Mr. Farquhar's paper, published some months ago, in "American Gardening." He advocates having all gardeners undergo an examination to see if they were worthy and properly qualified for the duties. But to page 181, and we will put through the sieve "which is often

owing to the ambition and want of practical knowledge in the gardener." The employer who would engage a man without credentials as to his ability, and make alterations, build rose and orchid houses, and a graper, at his suggestion, is, to say the least, very injudicious. The professional gardener, as a rule, is a very progressive animal; if he were not, he might find himself carrying his dinner pail into the same garden, as where he cleaned out stoke holes when in his teens. To quote again: "If he were in trade, he would manage to be more economical." No doubt, because he would not have the wherewithal. The qualified professional gardener is very economical; the very nature of his calling teaches him economy, of both time and space; he allows himself a certain time to go through his houses in the morning before his daily men come to their work, and apportion their tasks before he breakfasts; he has to see that all is properly done—no raking when there should be digging. As to economy of space, just look inside of his seed closet door. There ought to be found the kitchen garden plan for the year, and a key to the same, proof of how industrious the gardener has been during the winter evenings, dividing up the land for the different crops and successions, in order to keep his employer's table supplied 365 days in the year. Concerning the gardener's family: if the wife either makes or mars her husband's career, how is it that Mrs. Smith did not make her husband better than what he was? And again, if the man was no good, how came he to be filling a place where a professional gardener ought to be?

Where are you, professional gardener? Why not come out to protect the craft?

TIMBER TOPPER.

#### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be inserted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

FIRST-CLASS carpenter in large commercial place, where steady man is wanted. Ch. Hubner, 776 Third Ave., Brooklyn, N. Y.

FIRST-CLASS florist and landscape gardener; Scandinavian, 32, single, 16 year's experience. Europe and U. S., wants position. Address Florist 32, Post Office, Greenwich, Conn.

BY women, each with an infant or young child, situations in the country (general housework, plain cooking, etc.) in New York and adjacent States. Small wages expected. Railroad fare paid by Association. Apply State Charities Aid Association, 106 East Twenty-second St., New York City.

GARDENERS, farmers, etc.—Employers desiring the services of reliable men to fill positions as above, are invited to correspond with us. Our Register are the names of excellent men whom we have known for a long time. No fee charged to any one.—R. & J. Farquhar & Co., Seedsmen, 16 and 19 South Market St., Boston, Mass.

HEAD GARDENERS.—We have constantly on hand Gardeners of all kinds, single and married—men competent to take charge of graperies, greenhouses, vegetable gardens, lawns, roads, and the usual work pertaining to their profession. Correspondence solicited. Peter Henderson & Co., 35 & 37 Cortlandt St., New York.

WANTED situation by thorough practical English gardener, with twelve years' experience in America in all branches, including palms, orchids, roses, chrysanthemums, forcing vegetables and fruit, decorating, and the building of greenhouses. first-class references. age 34, married, one girl; would not refuse second position on good place. Address Palmer 28, Gardner Park, Rochester, N. Y.

#### WANTED.

[Rates, etc., same as in "For Sale" column.]

WANTED to exchange, Ohio and Turner Rasp, berry plants for field-grown roses and ornamental shrub cuttings. C. C. Nash, Three Rivers-Mich.

WANTED situation by boy, English, age 17, on gentlemen's place under a gardener, or local place where all branches of bedding can be learned, two years' experience. Address J. R., 489 Bramhall Ave., Jersey City, N. J.

PRACTICAL gardener and florist, thoroughly experienced with gardening and greenhouse work, would like situation with a gentleman's private place, 32 years, married, no family, personal and written references. Address Connecticut, Box 32, Wethersfield, Conn.

SITUATION wanted.—Gardener, single, age 40, well up in all greenhouse work, including hot-house grapes, mushrooms, etc., and competent in general management of private place, having English training with American experience. Address F. A., Box 2504, Sta. P., Phila., Pa.

**PAPERS, MAGAZINES, ETC.**—We will make you liberal concessions when you order other periodicals for the year, whether in connection with your own subscription or not. Send us your list for estimate American Gardening, P.O. Box 1097, New York.

### AGITATORS THAT AGITATE

keep the liquid always stirred to a point of utility. **THE DEMING AUTOMATIC** combines more good qualities than any agitator on the market. Used only on the **DEMING SPRAYING OF TREES**. Spray with Bordeaux Nozzle, "The World's Best." Hand-some 40-Page Book on Spraying sent free on application. **THE DEMING CO. SALEM, OHIO.** HENTON & HUBBELL, General Western Agents, 61-69 Jefferson St., Chicago.

Mention American Gardening when you write.

### The Cultivation of Phalaenopsis\*

In early boyhood I made up my mind to study the nature of the phalaenopsis, and believe I was fairly successful with the collection which was under my care at Summit, N. J.

I venture to say that it is only a question of a very short time when we will have the phalaenopsis on the cut flower markets of the United States, as plentiful as is the cattleya to-day. Who of us would have thought, ten years ago, that the demand for cattleya blooms would have reached the proportion it has assumed at the present time? Fifteen—yes, or even ten—years ago there was little indication that the love for orchids and orchid flowers would grow so rapidly.

I do not deem it expedient to go into the history of the phalaenopsis, in this or any other country, for the simple reason that it is not yet well enough known to have any really authentic history. There is now, I believe, only one noteworthy collection of this orchid in the country, since the sudden and untimely ending of Mr. G. Am-sinck's collection at Summit, N. J., which was the healthiest ever seen, according to the unanimous opinion of orchid experts on both continents.

In treating of the cultivation of any plant grown under glass, we must begin with the house in which we are to grow it. It is not necessary to have a house specially built for phalaenopsis; any ordinary stove house will do. Neither does it make much difference whether the house is built north, south, east or west, providing you have the desired temperature, which is 65 degrees; nothing more nor less; no variation from that in the winter.

The next thing necessary about the house is a full supply of pure air. Ventilation is one of the greatest essentials to their well being. I have often been told by orchid growers never to put air on the phalaenopsis when it was freeing hard outside. Well, contrary to advice, I have put it on, and kept it on all the time, whether the temperature was above or below zero; but when the weather was damp or cloudy, down came the ventilators tight, to remain so until the outside atmosphere became purified, when I would put on air again very gradually.

Heating is another factor which is too often omitted when required. It is absolutely necessary to have a little fire heat in summer to keep the inside atmosphere purified. The fires, therefore, should never be allowed to go out during the summer months; so that when the day is damp or cloudy, you are always prepared to get the best of the fungi which are sure to accumulate on the compost in such weather—a disease which, if allowed to grow and reach the roots or foliage of the plants, is bound to bring dire results. An excessive dampness in the house will bring black or yellow spot on the foliage—the worst disease of all to get rid of. In this case, I know of only one course to pursue, and that is a continual watch over every individual plant. When this trouble is discovered the remedy is simple, viz.: As soon as observed on the leaf, take your knife and cut off that portion of it where the disease has manifested itself, cutting at least half an inch below the spot, though it may be the top leaf. It seems hard to do this, but you will find by continuing this course right along in every case, and then using plenty of sulphur on the part of the leaf you have cut through, that you will have no more trouble with spot.

Another mischievous imp that brings about a great deal of vexation, and proves a great drawback to this magnificent orchid, is yellow thrip—the most desperate little insect that I have ever had to contend with. To get rid of him, as usual, keep a close watch and use tobacco in all forms; have some fresh stems on your pipes, and always keep a little fresh stems in water to sponge with; give a light fumigation three times a week. If this is done regularly, it will keep the thrip within bounds.

Phalaenopsis requires to be shaded from the direct rays of the sun at all times.

Watering is another of the most essential duties connected with the growth of this

\*Paper read by Peter McDonald, before the New York Gardeners' Society, February 13, 1897.

## Corn

is a vigorous feeder and responds well to liberal fertilization. On corn lands the yield increases and the soil improves if properly treated with fertilizers containing not under 7% actual

## Potash.

A trial of this plan costs but little and is sure to lead to profitable culture.

All about Potash—the results of its use by actual experiment on the best farms in the United States—is told in a little book which we publish and will gladly mail free to any farmer in America who will write for it.

orchid. I seldom used any other than rain water, and that always of the same temperature as the house. In watering baskets or pans (the plants are generally grown in such), the best way is to have a barrel or tank in the same house, as near to the pipes as you can get it, and dip your plants at least once a week. By this I don't mean the foliage of the plant, but the compost and roots and up as far as the bottom leaf. This done, they require to be looked after with the watering pot every morning. They require this treatment only when growing.

When resting, i. e., drying them off a little, in order to get their flower spikes through the hard skin in their natural way, one has to be very careful; because on this depends principally general results. You have to study and know at what time your plants are through growing, and whether it is wise to get them into flower. To stop a plant from growing in order to get it into flower, you should lessen the watering gradually, and when you see the flower spikes appear, increase the amount of water very slowly until the flower spikes are fully expanded.

Do they need to be fed? Well, yes, they do. I don't know what they get to eat in their native home, but I do know that under cultivation they will take a good meal once a week when growing. Fresh cow manure, diluted in water about one peck to the barrel, is what I used; and although I have also used several fertilizers I have found this liquid manure to be the best. But they should never be fed while in flower. The same course should be observed after they are through flowering, for at least two months. It is bad policy to let them flower too freely. I always made it a point to pinch out all flower spikes from weak plants, and prevent them flowering at all that year. The following year you will get a flower spike twice as strong and the plant will almost be double in size as a result of stopping it from flowering.

Now there are a great many little details which I do not consider necessary to mention here; these can be found in several orchid books. Suffice it to say that you have in this paper the principal points necessary to proper cultivation in order to obtain best results with phalaenopsis.

#### Black Knot in Connecticut.

State Pomologist N. S. Platt, of Cheshire, thinks black knot is spreading in many parts of the State, feeding on trees of the wild cherry and the sweet cherry and multiplying itself from them. The disease is one that is readily brought under control by cutting and burning the knots and spraying the trees with solutions of sulphate of copper. The knot spreads by spores and copper is death to the spore that it touches. Spray in spring before the buds open, with the copper solution of one pound sulphate of copper in twenty-five gallons of water. Later on, in early summer, when the tree is growing, give two or three sprayings of strong Bordeaux mixture, finishing by the time the fruit is half grown. The copper solution and the Bordeaux are both useful and necessary in controlling the shot hole fungus of the leaf and the rotting of the fruit of the plum, so one method of work is serviceable in controlling these distinct troubles. Bordeaux upon Japanese plums had always worked injury to the foliage.

#### Dicentras Without Price.

The Dicentra, or Lyre flower, known popularly as Bleeding Heart, enjoys the distinction of being both an old and a new favorite. Its brilliant color and long season of bloom make it especially desirable, too, in a new light, that of a plant for winter forcing. Being in almost every garden, and easily accessible during any open spell, it may be utilized thus in hundreds of homes where bulbs and costly plants are beyond reach. The new interest in this species, known as *Dicentra spectabilis*, has stimulated interest in others of the genus. *Dicentra cucullaria*, popularly known as Dutchman's Breeches, is now offered for sale at 20 cents per plant. Those who know its haunts may easily obtain it from the woods, as both this and the allied Squirrel Corn may be known by their peculiar roots.
